Stump, E. and Kretzmann, N. (1991) 'Being and Goodness', in S. MacDonald (ed.) *Being and Goodness*, Ithaca, NY: Cornell University Press, 98-128.(This paper explicates Aquinas' conception of the relation between being and goodness and argues that this position can be used to solve some problems discussed in contemporary ethics.)

Gorgias (late 5th century BC)

The most important of the fifth-century BC Greek Sophists after Protagoras, Gorgias was a famous rhetorician, a major influence on the development of artistic prose and a gifted dabbler in philosophy. His display speeches, Encomium of Helen of Troy and Defence of Palamedes, are masterpieces of the art of making a weak case seem strong, and brilliant exercises in symmetrical and antithetical sentence structure. Of philosophical importance is his treatise On Not-Being, or On the Nature of Things, an elaborate reversal of the metaphysical argument of Parmenides, showing: (1) that nothing exists; (2) that if anything exists, it cannot be known; and (3) if anything can be known, it cannot be communicated. This nihilistic tour de force *is probably a caricature rather than a serious statement of a philosophical position. Gorgias is a master of the persuasive use of* logos *(discourse), understood both as eloquence and as argumentative skill.*

1 Career

Born in Leontini in Sicily, Gorgias came under the influence of the Sicilian philosopher Empedocles as well as the local school of rhetoric associated with the names of Corax and Tisias. In 427 BC Gorgias led a delegation from Leontini to Athens, where his new oratorical style proved to be a great success. His lessons were very highly paid, and as a teacher he travelled throughout Greece. He gave public speeches at Olympia (where he urged the Greeks to unite against the Persians), at Delphi and elsewhere. His written works, such as the epideictic or model speeches *Encomium of Helen of Troy* and *refid="A052bibent4">Defence of Palamedes*, created a new, elaborate prose style which profoundly influenced the development not only of oratory but of literary prose generally. His pupil Isocrates founded the first school of rhetoric and the first institution of higher learning in Athens.

Gorgias lived to be over one hundred years old, and he is said to have read with amusement Plato's dialogue named *Gorgias* (written *c*.395-387 BC) and remarked: 'How well Plato knows how to make fun of people!'.

2 Teaching

Unlike Protagoras (§2) and many later Sophists (see Sophists), Gorgias made no claim to train students in moral and political virtue, but only to make them skilful public speakers. He developed both the theory and practice of persuasive speech (*logos*) as a technique of power (see Logos §1). Comparing the effect of speech on the soul to the action of drugs on the body, Gorgias describes how 'some speeches cause grief, some cause delight, some produce fear in the hearers while others produce confidence, and some by an evil persuasion drug and bewitch the soul' (*Helen* 14, fr.11). Hence in legal and political competitions 'a single *logos* delights and persuades a great crowd, because it is written with art, not because it is spoken with truth' (*Helen* 13, fr.11). In the dialogue *Gorgias*, Plato calls attention both to the power and to the lack of moral responsibility involved in Gorgianic training in rhetoric. And by presenting as followers of Gorgias the subsequent speakers Polus and Callicles, who systematically attack traditional Greek notions of morality, Plato's dialogue clearly implies that 'Gorgias' teaching is the seed of which the Calliclean life is the poisonous fruit' (Dodds 1959: 15).

Gorgias' own conception of 'writing with art' produced a highly ornamental prose style, where balanced clauses and euphonious word choice dazzle the ear and titillate the mind in sentence after sentence. We can still appreciate this effect in the extant *Encomium of Helen* and *Defence of Palamedes*, two display pieces that were apparently written as models for his students to memorize and imitate. A later taste finds this style artificial and exaggerated, but as a sheer technical exploit Gorgias' compositions made such an impression on his contemporaries that the art of writing in prose was permanently changed. Agathon's speech in Plato's *Symposium* (194e-197e) is one of the more elegant examples of direct Gorgianic influence. Gorgias' most distinguished pupil, Isocrates, established the classical style in Greek oratory with milder, less mechanical forms of parallelism and antithesis in sentence structure, which Cicero was later to reproduce in Latin.

3 Philosophical work

It is not clear that Gorgias made any major contribution to the development of Greek philosophy. Whether or not he was personally a pupil of Empedocles, as an ancient tradition reports, he was certainly familiar with the new natural philosophy which had come from Ionia to Sicily by the middle of the fifth century BC, and he made use of it in his teaching. Thus Meno, who is represented by Plato as a pupil of Gorgias, is fond of physical explanations

of sensory perception in the style of Empedocles (*Meno* 76c-e) (see Empedocles §6). To this extent, as a popularizer of the new science Gorgias was (like the other Sophists) a typical representative of the fifth-century Enlightenment. His own, more personal, achievement is represented by a treatise *On Not-Being or On the Nature of Things*, which has come down to us in two later summaries, one in the Aristotelian corpus (the pseudo-Aristotelian text *On Melissus, Xenophanes and Gorgias*, 979a-980b) and another version given by Sextus Empiricus (*Against the Professors* VII 65-87).

It would seem that the title of this treatise is already a joke, since it equates a discussion of nonentity or nothingness (the Parmenidean notion of not-being) with the Ionian investigation of the nature of things (*peri physeōs*) (compare Parmenides §2). Even if the intention of the author is not entirely serious, the text is of considerable historical interest, on several counts. It contains the longest example of continuous argumentation that has reached us from the fifth century BC. The closest precedent is provided by the poem of Parmenides and the paradoxes of Zeno of Elea). Gorgias' argument is in fact a direct inversion of Parmenides' reasoning in favour of being, which, according to Parmenides' argument, is the only subject that can be known and described in rational language. By contrast, Gorgias argues: (1) that nothing exists, or that there is no being at all; (2) that if anything exists, it cannot be known; and (3) if anything can be known, it cannot be communicated in language. Gorgias' reversal of Parmenides' reasoning follows the original so carefully that it has permitted modern scholars to reconstruct some features that are badly preserved in Parmenides' text. Gorgias' reasoning is indirect in form, like Parmenides', and it has benefited from the additional subtlety introduced by Zeno's paradoxes. Gorgias' work thus served to popularize not only natural philosophy but also Eleatic logic.

This treatise is, like the *Encomium of Helen*, a *paignion* or plaything. But what Gorgias is playing with is Parmenidean ontology and Zenonian dialectic. Consider the argument for the first thesis, 'that nothing exists' or 'that there is nothing'. (Translation is difficult, since in Greek the verb *esti*, 'is', and the participle *on*, 'being', cover both existence and predication; the notion of being represents a fusion of the two.) In the version of the argument given by Sextus, the proof of this thesis begins with a trilemma, echoing the three Paths of Parmenides' discourse on Truth. 'If something exists, then either Being (*to on*) exists or Not-being (*to mēon*) exists or both Being and Not-being exist'. The three options are then eliminated *seriatim*. First of all, 'Not-being is not (does not exist). For if Not-being exists, it will at the same time be and not be. Understood as Not-being, it will not be. But insofar as Not-being exists it will also be. But it is utterly absurd for something at the same time to be and not to be. Therefore Not-being does not exist'. The proof that being also does not exist begins again with a trilemma: 'If Being exists, it is either eternal or generated or both'. All three possibilities are then refuted.

The arguments to show (2), that, if anything exists, it is unknowable, and (3), that, if anything is known, it cannot be communicated, are of philosophical interest inasmuch as they emphasize the gap between thought and reality on the one hand, and between thought and language on the other. But the preserved arguments seem grossly fallacious. They are good illustrations of the later notion of sophistry as making use of specious argument. On the other hand, the general form of the reasoning is reminiscent of the dialectical second part of Plato's *Parmenides*. Since we do not have Gorgias' own wording, it is difficult to know whether Plato is imitating Gorgias or whether our text has been reshaped under the influence of later, more sophisticated argumentation.

Besides displaying the virtuoso skills of its author, Gorgias' treatise seems designed to discredit ambitious philosophical reasoning of the sort initiated by Parmenides and Zeno. This is in any case the conclusion drawn by Isocrates (Gorgias fr. 1): if these theses can be logically argued for, why should we take any such arguments seriously? In a more light-hearted way, but with greater technical sophistication, Gorgias thus joins the attack on Parmenidean dogmatism that was launched by Protagoras with his 'Man-the-measure' thesis.

Grace

Grace is a gift of personal relationship with God surpassing the powers of nature. Such relationship presupposes the relation every creature has with God as immediately dependent on him for its very existence and continuance, but goes beyond it in its distinctive personal character and the resulting more intimate dependence.

Such personal relationship necessarily depends upon some will or expression of will. The development of the relationship must be free in relation to what has gone before - it must in no way be necessitated. Therefore, if the relationship arises within some established natural system involving some degree of conformity to law at some levels of description (physical or otherwise), such a system and laws must leave some degree of indeterminacy. This allows the possibility that free actions, physically and psychologically contingent, should be among the ultimate determinants of what unfolds. For the workings of grace must always be free or contingent in relation to such a system of nature, concordant with and fulfilling nature, but working according to distinct principles - grace and nature are both equally God's gift, but always distinct.

The notion of grace has no place outside some kind of theism. Implicit in Judaism, its explicit development has been in Christian theology, which sees human beings as radically dependent upon God not only for redemption from personal sin, but for any personal or 'supernatural' relationship to God at all. This emphasis on grace is peculiar to Christianity, although the general conception seems implicit in most theistic religions; it can perhaps be found in the more theistic forms of Hindu devotion, although it is absent from Buddhism and the stricter forms of Hinduism.

1 Grace and nature

In considering grace, there are questions which spring from a need for logical clarification and questions arising from real theological disagreement. Differences in philosophical framework often make applying this distinction difficult. The same formulation may disguise real differences, while opposed forms of words sometimes conceal agreement.

The first distinction to be made is between what belongs to God's unconstrained will simply by his being and nature (for example, his existence and his delight in it, and, in Christian understanding, the relationships of Father, Son and Holy Spirit, none of which are by free choice) and what arises from his free will. Creation and grace both belong to his free overflow of love, entirely without necessity.

Grace is a gift of God constituting or expressing a supernatural relationship (analogous to friendship) or relational disposition (personal goodwill directed towards such friendship): many of the words for 'grace' in different languages signify 'being favoured', either as a steady state or as a possibly temporary disposition. As such, it arises in connection with created persons, not just as created beings but precisely as persons. In the human case, these persons begin in the womb and mature in stages. In Christian understanding, their relationship is to God as three persons, Father, Son and Holy Spirit, united in one single act of being. The word 'supernatural' in this context means something essentially geared to such a relationship or possibility of relationship, freely given and entered into. As such, it is entirely distinct from the merely 'preternatural', a word which refers to what is coeval with nature even if interfering with it, such as poltergeists and other supposed paranormal phenomena, and any supposed activities of spirits, devils or disembodied souls not directed to assisting or resisting divine activity.

However, God's special favours towards individuals have sometimes been conceived solely in terms of his providing some special created happiness (such as envisaged in portrayals of paradise as an earthly garden), or special help in dealings in this life (such as described in some of the Psalms), or special prophetic knowledge. This is compatible with a way of thinking which regards virtue pleasing to God, and even perseverance so as to attain heaven (identified with paradise), as within human power, perhaps assisted by the imitation of moral examples such as Jesus. This view is represented in the fifth-century British monk Pelagius as well as in modern exemplarist theories of the atonement, such as that of Hastings Rashdall (see Pelagianism §1).

Such approaches led Western Christian theology, following Augustine (§13), to give primary emphasis to the necessity of grace for any state, act or virtue pleasing to God, for any repentance and any perseverance in virtue. Augustine conceived mankind as having forfeited all right to friendship with God by a primeval choice preferring

lesser goods (for, since God had created mankind to be a family in solidarity with one another, the sin of one affected all) (see Sin §2). Hence, the first role of grace was to undo the effects of this 'original sin'. Accordingly, the primary role of Jesus' redeeming action tended to be seen as the undoing of this negative effect so as to reopen the possibility of supernatural friendship with God.

But such a negative conception of grace, as necessary simply to undo the effects of sin, obscures the absolutely basic Christian presumption that any act of love towards God appropriate to the kind of friendship God intends is beyond human power alone. In this conception, such acts of love would have been beyond human power even if there had been no sin - indeed they are equally beyond angelic power, so that even the angels depend on grace. Such love requires the coaction of God within our act, and it is this which makes the kind of friendship concerned essentially 'supernatural'. This principle was plain in John's Gospel, Augustine and many other Christian 'Fathers' long before being given Thomas Aquinas' careful articulation, according to which any act meriting salvation has to be moved by charity (*Summa theologiae* IaIIae, q.109; q.114, aa.2, 4), which is explained as a God-empowered mutual friendship involving God's co-working in us (IIaIIae, q.23, aa.1-2; compare a.7; on co-working, IaIIae, q.111, a.2).

Many other theists share this general conception, but Christian teaching gives it special emphasis. Christianity envisages a relationship which enables us to pray 'Abba, Father' ('Abba' being an intimate word like 'papa' or 'daddy'). Such prayer expresses some intimate sharing in the life of the Godhead alongside Jesus, a sharing that gives hope of the vision of God. Such intimacy and such vision are not within natural human power.

2 Grace essentially related to loving personal relationship with God

Historically we find two different accents in the treatment of grace. First, there is an accent on grace as God himself, under the aspect of giving himself in some kind of divine indwelling, and under this aspect referred to as 'uncreated grace'. Second, there is an accent on created grace, grace considered as involving alteration in the created person and their intellect and will. Eastern Christian tradition has always emphasized uncreated grace, that is, God himself, sometimes speaking of this as an uncreated divine energy, and regarding this as primary. By contrast, Western tradition has commonly treated the real alteration of created persons, their transformation into new creatures, as most important. This created grace has been conceived as going to the root of the person's being, but also as co-working within their faith and love and their particular acts of faith and love.

The insistence on grace as something real in the creature (on created grace), has been especially evident in Roman Catholic teaching; for example, it is found in Aquinas' rejection of the idea that grace consists only in an attitude of God (of favour') towards someone, rather than in a gift of God to that person making them pleasing to God (equally, Aquinas rejects the idea that the remission of sins involves only imputing justice to people rather than effecting a real change in them, rendering them actually just and pleasing; see *Summa theologiae* IaIIae, q.110, a.1, q.113, a.2). This has sometimes generated the picture of grace as being like a liquid poured upon us or into us, it then being mistakenly conceived of as something which, once given to us by God, we possess neither more nor less independently of him than we possess his natural created gifts; this picture is often associated with the (mistaken) belief that medieval thinkers supposed the sacraments to communicate grace by created human power (contrary to the Catholic insistence that God alone causes grace and is the principal agent in the sacraments). Luther revolted against such notions, insisting on speaking of justification as something imputed rather than imparted, and rejecting the supposed conception of the sacraments as human works causing grace. In such a context, the Reformers unsurprisingly preferred such translations as 'highly favoured' to 'full of grace' as descriptions of the Virgin Mary.

Hans Küng (1964) interprets Luther's texts in a way seemingly compatible with regarding the grace of being justified as internal to the person justified, it being wrong to suppose that what God regards as just he could so regard if he did not in the same act make it actually just. Whether or not Küng's own explanations are satisfactory, granted the obscurities of his phenomenological/existentialist idioms, clearly many other points of dispute between Catholic and Protestant conceptions are terminological rather than real. Standard logical distinctions have to be taken into account: for example, whether or not someone is courageous is a matter of fact, not a matter of degree, whereas how courageous someone is is a matter of degree. Thus, in the standard Protestant idiom, 'the grace of justification' refers to the matter of fact and 'sanctification' to what has degrees - whereas the standard Catholic idioms for the same matter of fact are 'being in a state of sanctifying grace' or 'being in communion with God',

and ‘the grace of justification’ and ‘sanctification’ are treated as the same reality, distinct only in the aspect described, both equally having degrees.

John Oman (1917) indicates how the underlying problem is to be resolved by recovering the full implications of conceiving grace relationally. His explanation is reminiscent of Aquinas’ treatment of the supernatural (‘theological’) virtue of charity as involving essential mutuality, mutuality deeper than in normal human friendship. Aquinas’ explanation of this depth is that this friendship is only established by the love of God first giving us the requisite faith and goodwill towards him, and that the acts belonging to it essentially involve, on the human side, God’s co-working in us. The general problem is how to give an adequate explanation of the particular way in which grace in the creature has no existence independently of relationship with God. It is the peculiar way in which personal relationship is internal to grace that makes it intrinsically supernatural.

Karl Rahner (§5) uses ideas from Aquinas to explain how God dwelling in us (uncreated grace) is specially internal to the transformation of the creature (created grace), noting that Aquinas regarded the sanctifying grace required for charity towards God in this life as having the same ontological presuppositions as the immediate vision of God (Rahner 1961). Only God (Jesus, the Word of the Father) dwelling in the soul could be the principle of this beatific vision - God is related to it as the impression or concept shaping our seeing or understanding of something is related to that seeing or understanding. God the Father and Son, with the Spirit breathed by them, make themselves, as it were, the internal principles of the workings of our own heart and mind. It is this presence which makes us ‘new creatures’, adapted to God’s co-working in us in this love and vision, things whose possibility is known only through revelation.

In Catholic and Orthodox thinking, grace always perfects nature, never abolishes it. It has to be the very same human being, previously sinful, who is now in love with God: continuity in individual identity depends on some continuity of nature. Nature is not of itself capable of grace, nor is the finite of itself capable of the infinite, but created nature can be enhanced by grace so as to be able, with God’s co-working, to reach the love and vision spoken of. However, this still involves not just an addition to or strengthening of the powers of the human soul or person, but a change at a logically deeper level. For, as the difference between a human being and an amoeba is not just that additional powers are added to a nature which is the same, but that the possession of these additional powers reflects a richer nature of which these powers are only an expression, so the difference between a person supposed to be without grace and a person in a state of grace involves an enlargement of a person’s nature. A person’s power to know and love God in the way appropriate to the friendship opened out by faith presupposes such enlargement. Therefore, grace has the same logical relation to the powers and activities which it makes possible as human nature has to natural human powers and activities, and it is in this sense that it belongs to the essence of the soul rather than being a mere accident external to it - that is, it constitutes a real transformation at the root of the human being, making a person, in St Paul’s words, ‘a new creature’.

3 Grace within the human framework

The phrase ‘the economy of grace’ traditionally signified the household provision for the distribution of grace among the human race as a historically ramified family (subject to no restrictions of scarcity such as the modern use of the word ‘economy’ suggests). In the traditional Christian conception, every giving of grace in God’s providence is preceded by some preparedness for the receiving of the grace concerned (some ‘prevenient’ grace). Thus, in each individual’s life, some remnants of the original good in human nature give them some openness to truth and desire for relationship in their heart with God. More particularly, before giving any special gift, God tends first to raise up the desire and then even the will and prayer for it. In this conception, the whole law of God’s working towards humanity is not that he imposes his will, but that he waits on human readiness, consent and cooperation, each as appropriate to the degree of maturity of the human beings concerned.

In Jewish as well as Aristotelian thinking, human beings are essentially social by nature - an inseparable consequence of their bodiliness and biological nature (in scholastic thinking, putting human beings in contrast with the angels, whose sociality is supposedly differently rooted). This essential sociality is the key to Mersch’s explanation of ‘original sin’ (Mersch 1951): God allowed the sin of one to affect all, preserving human solidarity, because he was intent on human beings coming to salvation as one community, so that in Jesus’ becoming man the same solidarity should become the means of opening up a new way to salvation, the obedient love of one being effective for all. It also explains how the prayer or consent of one person or group, or the Church, can avail for

others, so that none need be too immature, too weak or even too proud (since pride can be broken) to be outside the scope of grace - and none too ignorant by reason of their historical or geographical situation.

In common Christian thinking, grace restoring human beings to fellowship with God ('freeing them from original sin') has been made available to every human being throughout time. Thus, before the coming of Christ, independently of historically received knowledge of his redemptive suffering and death on the cross (his 'passion'), human beings received grace in anticipation of this redemptive work. All this is conceived as geared to a plan of God for the whole of mankind; so, for example, the fact that Old Testament prophets, and, in Catholic and Orthodox belief, the Virgin Mary in an especially complete way, should have received grace and grown in friendship with God from early in their lives was part of God's wider plan, each stage of the unfolding of which should wait upon appropriate human preparation, consent and cooperation.

It accords with this conception that, within this plan, the immature (for example, the infants massacred in Bethlehem) with a place in the prayer of Israel or of other God-inspired religious company (in the case of infant baptism by the prayer of the Church), and all young or old who suffer 'for the sanctification of the Name' (Jews, notably in the Holocaust, and Christians and others in other martyrdom), are in reach of salvation - and, along with these, everybody who, although mature, lacks effective explicit knowledge of God's desire and plan (whether through living in times and places too early or remote to have heard the gospel, or through accidents of culture affecting response to the gospel). All these stand as people waiting, waiting to enter salvation in one company with those to whom Christ's coming, the Church, Scripture and history make a more fully human response possible in this life. 'Fully human' means fully relational, personal and communal, fully intellectual with appropriate bodily and social expression by sign and voice. In this conception, such waiting is absolutely required if the salvation into which all who are willing are to enter is to be as fully humanly unified and complete as the work of Christ makes possible: bodiliness and historicality necessarily involve such a structured communal entry into salvation. In this conception, a person can be excluded from such salvation only by their own decision of heart and will. Tradition and different theologians have indicated so many different ways God might prepare human beings so as to be able to receive grace that it has become increasingly obscure whether a doctrine of limbo is necessary at all - so long as grace is only in anticipation of Christ's work and salvation is completed only in being joined in community with Christ and waiting 'to reach their perfection only in company with us' (Hebrews 11: 40) (see Limbo).

St Paul tells us that God desires the salvation of all human beings. Not all have interpreted Paul in the way sketched above (Aquinas outlines the three traditional alternatives in *Summa theologiae* Ia, q.19, a.6, ad.1). For some, grace seemed inaccessible to the unbaptized and even to all the immature, as well as to virtuous heathen ancient or modern. Others made the human will seem almost irrelevant by considering all salvation to depend upon God's determination in giving the graces of conversion and perseverance to an effective extent, either predestining only some (Calvin's tendency) or by predestining all ('universalism'). Modern theological history is littered with controversies in this area, with views associated with Calvin (§§3-4) and Jansen (tending in one direction), and Molina (§§2-3) and Arminius (tending in the other) all seeming one-sided or unacceptable to some, while Dominicans and Jesuits were restrained from controversy even in the supposed middle ground. In short, the problems of conceding a genuine reality to time and a real coauthorship in history between God and human beings in the giving and receiving of grace have proved more difficult than those concerning God's foreknowledge.

There has been much confusion between foreordination to salvation and knowledge of it (called 'assurance'). Aquinas argued that none have certain knowledge of their damnation (such knowledge would make them worse) and that few have certain knowledge of their salvation (knowledge tending to generate arrogance), regarding this as a special gift reserved for a few (*Disputed Questions on Truth*, q.6, a.5); many Protestants, however, regard it as the norm, and this has been presented as one of the defining features of Methodism.

4 Grace and creation

One problem with conceiving grace negatively as simply undoing the effects of sin was discussed in §1 above. A second defect in this conception is that it obscures the logical point that the good gained in redemption may be greater than that lost through sin. Christian theology requires not just that this may be so, but is so, for, as Augustine (§9) says, God only permits evil because through it he may bring greater good: Adam consorted with God in the first paradise but, after the death and ascension of Jesus the Son, the whole Godhead, Father, Son and Holy Spirit, are to come together to live in those who abide in the Son's love - God not only with us but within us.

The Roman Catholic Easter liturgy even refers to Adam's sin as 'happy fault, necessary sin, to gain for us so great a Redeemer'.

Medieval theologians asked whether Jesus, God the Son, became incarnate only to undo the effects of sin, further benefits being accidental, or whether he would have adopted this solidarity with mankind anyway, independently of sin. Aquinas, regarding Scripture as making sin the only certain reason for the Incarnation, left it open that God might still have willed the Incarnation even if there had been no sin. By contrast, Duns Scotus, relying on the principle that what is fitting must be true (a principle Aquinas did not regard as giving proof in revealed theology), envisaged the willing of the Incarnation as unconditional, a way followed by many modern theologians, especially those influenced by Karl Barth; it is echoed by de Lubac (1984) and Rahner (1961), who both represent 'nature' as a mere abstraction, historically never free of the supernatural, but always already laden with grace. They refuse to envisage the plan of creation as established first, with grace arising only as a special response to a contingency within it; instead they regard the whole history of creation as set within the context of the order of grace rather than vice versa, so that it is essentially, not just incidentally, a *Heilsgeschichte* (conventionally translated as 'Salvation History'). Within such a perspective, the greater good arising in response to a foreknown Fall is conceived as foreordained.

Gramsci, Antonio (1891-1937)

An Italian Marxist theorist and activist, Gramsci's main contribution lies in his critique of dialectical materialism. This school treated both the power of the bourgeois state and the prospects for its revolutionary overthrow and replacement by a stateless communist society as necessary consequences of the autonomous development of the economic forces of production. In contrast, Gramsci emphasized the relatively independent role played by politics and culture in upholding the authority of the state and in organizing popular resistance to it. A canonical figure of Western Marxism, he is credited with formulating a strategy applicable to all communist parties operating in the democratic states of advanced industrial societies. However, the posthumously published Quaderni del carcere (Prison Notebooks) elaborate on theoretical questions that had preoccupied Gramsci throughout most of his political career and which reflect peculiarities of the Italian political situation and traditions.

1 Life

Born in Sardinia, Gramsci won a scholarship to study at the university of Turin in 1911. He became involved in the Socialist Party and eventually gave up his studies to become a full-time journalist for various Party newspapers. The journal *L'Ordine Nuovo (New Order)*, which he edited with the future communist leader Palmiro Togliatti, provided the main theoretical inspiration for the occupation of the factories in the Turin region in September 1920. Dissatisfaction with the Socialist Party and union support for the movement led him to join the secession to form the Communist Party of Italy (PCd'I) in 1921. However, his unorthodox Marxism and his advocacy of workers' democracy and the formation of an alliance between proletariat and peasants were initially just as out of favour here. Mussolini's seizure of power in 1922 led to a change of Party policy. In 1924 Gramsci was elected to Parliament. He returned from Moscow, where he had acted as the PCd'I's representative and met his wife Julia Schuct, and was appointed General Secretary of the Party. In 1926, however, he was arrested, and in 1928 sentenced to twenty years imprisonment. In spite of the Fascist prosecutor's desire 'to stop this brain functioning', enforced withdrawal from politics enabled him to reflect upon it: between 1929 and 1935, when chronic illness sapped even his intellectual willpower, he filled thirty-three exercise books with some 2,848 pages of notes. He had suffered from ill health all his life which was exacerbated by prison conditions and died a week after his commuted term ended.

2 Historical materialism and Crocean historicism

The distinctiveness of Gramsci's thought stems from his critique of the positivist Marxism of his day. He began by attacking the materialist and associationist psychologies employed by certain versions of historical materialism. While matter might be the essence of things, such theories ignored humanity's capacity to control natural processes and mould them to its will. He criticized the crude empiricism of certain positivist Marxists on similar grounds: facts do not speak for themselves but only make sense within some theory that provides criteria for their selection and significance. He then built on these criticisms to dispute the claim that the economic base determined in a mechanical manner the ideological and political superstructure (see Marx, K. §7). As before, such a statement ignored the independent role played by human consciousness. Gramsci pointed out that institutions and belief systems had internal dynamics of their own, which had no direct connection with economic developments. More important, the influence of the base was mediated through particular superstructures, and we engage with the structure and partially constitute it through our activity and ideologies. In one of his most famous early articles, he contended that the Russian Revolution could only be understood in this way. The collapse of the Tsarist regime and Lenin's ability to seize his opportunity had been to a large extent superstructural. The Soviet Union's task was now to build the economic conditions from which a true communist society could emerge. As such it was a 'Revolution against *Capital*', at least as economistic Marxists interpreted this work.

Gramsci's critique drew on the ideas of the idealist philosophers Croce (§3) and Gentile (§3), both of whom had written important studies of Marxism. Particularly influential were Croce's denial of a priori principles and his identification of philosophy with historical judgment, and Gentile's thesis of self-constitution through the unity of theory and practice. However, Gramsci was keen to rebut the charges of idealism and voluntarism that had been levelled against him, and a major section of the *Quaderni del carcere (Prison Notebooks)* is devoted to pointing out Croce's errors. Gramsci argued that just as materialists treated matter as a metaphysical entity that determined

all human action, so Croce had a tendency to attribute all human thought to the unfolding of a mystical ideal entity - spirit. He charged Croce with treating history as the product of the internal dynamics of thought, and ignoring the interplay of theory and action in the practical task of engaging with and changing the world. Gentile’s actualism might seem more promising in this respect, but Gramsci believed he committed the even graver error of emotivism, which culminated in the conclusion that might is right, as his allegiance to Fascism demonstrated only too clearly.

Thus, Gramsci contended that in different ways both materialism and idealism resulted in passivity. Materialism encouraged the masses to regard revolution as an inevitable product of changes to the economic base to which they need not contribute. However, the existence of the objective conditions for revolution was not in itself sufficient: ‘One must "know them" and how to use them. And want to use them’ (*Quaderni*: 1338). Idealism led to an uncritical acceptance of prevailing ideas and a failure to relate them to economic and social circumstances. Going back to Marx’s 1857 ‘Preface’ and the *Theses on Feuerbach*, Gramsci argued that the true Marxist message was that the economic base constrained rather than determined the superstructure. The superiority of Marxism over other social philosophies lay in its claim to be able to make the most of existing circumstances so as to benefit humanity at large - a goal Gramsci largely associated with the achievement of the maximum productivity possible with the available techniques. However, this claim had to be sustained by engaging with existing ideologies and persuading the masses to act on the basis of Marxist principles.

3 Hegemony

Gramsci’s emphasis on the role of will and consciousness fed into what most commentators regard as his chief contribution to philosophy - his concept of hegemony. Gramsci employed this term in two related ways. First, he used it to denote the consensual and ideological, as opposed to the coercive, basis of a political system. The state consisted of two elements. On the one hand, there was the coercive apparatus comprising the police, army and judiciary who could uphold the authority of the ruling class through force. On the other hand, there were the various institutions of civil society, such as the media, schools, churches, clubs, parties and trade unions. These organizations were the instruments of hegemony, the means whereby the dominant class obtained the spontaneous adherence of the rest of the population to its rule. Hegemony would allow a ruling group to hang on to power long after it had ceased to be the leading economic class. This point was vital to understanding the resilience of liberal democracies during the economic crisis following the First World War. Gramsci claimed that civil society was infinitely more developed within advanced industrial societies. In contrast to Russia, which was comparatively backward, in these countries revolution could not take the form of a direct military assault on the forces of coercion until the battle for civil society had been won and the masses convinced that their true interests lay in overthrowing the old order. In Gramsci’s terminology, it was necessary to fight a ‘war of position’ to capture or supplant the institutions of hegemonic power before turning to a ‘war of manoeuvre’ and violent revolutionary action.

This leads to Gramsci’s second usage of ‘hegemony’; this time referring to the cultural and educative task of the Party in the formation of a coherent moral awareness and political will among the proletariat. The building of this new hegemony went through numerous phases. At the most basic level, it involved the political organization of the proletariat and making them conscious of their class and economic interests. However, to be truly hegemonic it was necessary to go beyond this stage and persuade other groups, particular the peasantry and the petit bourgeoisie, to identify their interests with those of the proletariat. Gramsci believed that the bourgeoisie in the UK and France had successfully universalized their point of view in this manner, convincing workers of the validity of capitalist economics and getting them to adopt bourgeois aspirations.

While Gramsci believed that this strategy had to have some foundation in economic reality to be plausible, it was an essentially political task. The Party had to constitute itself as an alternative civil society, offering schools, clubs and a focus for social life. A particularly important role would be played by intellectuals, who had the job of mediating between the Party leadership and ordinary people. Gramsci distinguished between ‘traditional’ and ‘organic’ intellectuals. The first were self-styled ‘detached’ scholars such as Croce. The second, in contrast, did not see themselves as a class apart. They acknowledged their membership of a particular social group and sought to lead its members to greater self-awareness. Gramsci did not think that the masses could ever be totally deluded by bourgeois ideology. The seeds of dissent from hegemonic views always existed in embryonic form if these failed to correspond to real interests. Organic leadership simply consisted of making the masses aware of this fact

and getting them to relate their dissatisfaction to those of others. The result was to be the formation of a collective will for change.

Gramsci rejected Lenin's view that the Party cadres had to form an elitist vanguard and dictate to the people what they ought to believe and do by referring to scientific laws of history (see Lenin, V.). He opposed 'democratic centralism', that brought together leaders and led 'organically' to 'bureaucratic centralism' that operated 'mechanically' on the basis of directives sent from above. A Party organized in this fashion would always be a 'policing organ' rather than 'a deliberative body' (*Quaderni*: 1691-2). However, his theory was not without a sinister side of its own. The moral and intellectual revolution within people's consciences was to be so complete that the Party was to take the place of 'the Divinity or the categorical imperative' in their minds, with all acts judged good or bad to the extent that they benefited the Party (*Quaderni*: 1561).

4 The New Order

Gramsci believed that a cultural consensus around a shared moral vision would make the coercive force of the state redundant under communism. Drawing on Lenin's somewhat idealized account of the soviets, his own experience of worker's self-management during the occupation of the Turin factories, and his reading of accounts of the introduction of Frederick Taylor's management techniques by Henry Ford, he argued that factory production provided the economic and social preconditions for the autonomous organization of workers. He believed that the industrial system was potentially self-regulating. All that was required to ensure that production was related to the needs of the producers and that supply exactly matched demand, was to raise each individual worker's consciousness of their role within the productive process and their relationship to the rest of the global economy. This goal could be achieved through a worldwide network of factory and peasants councils that was hierarchically organized according to trade and region, and which culminated in an international administration that supervised the world's resources in the interests of all humanity. This network would serve as a vast information system through which workers both channelled their requirements and modified them to take into account those of others. In this way, a collective will gradually came into being that was linked to the maximal employment of the productive system. In so arguing, however, Gramsci risked justifying as total a subordination of the individual to the demands of technological development as he accused deterministic Marxists of proposing. His theory has no place for the traditional Marxist concern with alienation, concentrating rather on the removal of anomie through the assimilation of norms most suited to the regulation of production (see Alienation §§3-5).

5 An Italian theorist

Gramsci's ideas grew out of his reflections on the relatively backward nature of Italian capitalism and liberal democracy, and his attempts to account for the failure of revolutionary action and the triumph of fascism in the aftermath of the First World War. In addressing these problems, Gramsci was influenced as much by certain themes of the Italian political tradition as he was by his reading of Marx and Lenin. The machiavellian view that politics involves the mobilization of consent as well as the judicious employment of force, which was taken up in very different ways by contemporary Italian political sociologists such as Mosca and Pareto, and idealist philosophers such as Croce and Gentile, was particularly important in this regard. Indeed, Gramsci significantly referred to the Party as the Modern Prince (see Machiavelli, N. §6).

In common with a long tradition of nineteenth- and twentieth-century Italian writers, Gramsci believed that the unification of Italy had been incomplete. As a Sardinian, he was all too aware that the Piedmontese state had succeeded in imposing political unity upon the region but had failed to assert its hegemony so as to 'make Italians'. Gramsci thought Fascism had arisen in Italy in part because the capitalist class had not become hegemonic and so had had to rely on more directly coercive methods. A successful and enduring social revolution would have to make good this failure. Gramsci's emphasis on consent and cultural consciousness, therefore, resulted in part from reading Marx from the perspective of a characteristic Italian concern with moral unity in order to construct a *via italiana* to communism.

Greek philosophy: impact on Islamic philosophy

During the Hellenistic period (323-43 BC*), classical Greek philosophy underwent a radical transformation. From being an essentially Greek product, it developed into a cosmopolitan and eclectic cultural movement in which Greek, Egyptian, Phoenician and other Near Eastern religious and ethical elements coalesced. This transformation is best symbolized by the role Alexandria played as the hub of diverse currents of thought making up the new philosophy.*

When the Abbasid Caliphate was founded in Baghdad in 750 AD*, the centre of learning gradually moved to the Abbasid capital, which became in due course the heir of Athens and Alexandria as the new cultural metropolis of the medieval world. About two centuries later Cordoba, capital of Muslim Spain, began to vie with Baghdad as the centre of 'ancient learning'. From Cordoba, Greek-Arabic philosophy and science were transmitted across the Pyrenees to Paris, Bologna and Oxford in the twelfth and the thirteenth centuries.*

The initial reception of Greek-Hellenistic philosophy in the Islamic world was mixed. It was frowned upon at first as being suspiciously foreign or pagan, and was dismissed by conservative theologians, legal scholars and grammarians as pernicious or superfluous. By the middle of the eighth century AD *the picture had changed somewhat, with the appearance of the rationalist theologians of Islam known as the Mu'tazilites, who were thoroughly influenced by the methods of discourse or dialectic favoured by the Muslim philosophers. Of those philosophers, the two outstanding figures of the ninth and tenth centuries were al-Kindi and al-Razi, who hailed Greek philosophy as a form of liberation from the shackles of dogma or blind imitation (*taqlid*). For al-Kindi, the goals of philosophy are perfectly compatible with those of religion, and, for al-Razi, philosophy was the highest expression of man's intellectual ambitions and the noblest achievement of that noble people, the Greeks, who were unsurpassed in their quest for wisdom (*hikma*).*

1 The rise of Neoplatonism

Neoplatonism has been described as the final summation or synthesis of the major currents in Greek philosophy, Pythagoreanism, Stoicism, Platonism and Aristotelianism, into which an oriental religious and mystical spirit was infused (see Neoplatonism). Its founder, Plotinus, was born in Lycopolis in Egypt, studied at Alexandria and lectured in Rome. He studied with Ammonius Saccas and was a classmate of Origen, who became a Christian. Plotinus was so profoundly interested in oriental religions that he joined the abortive expedition of the Roman Emperor Gordian to Persia, as we are told by Porphyry, Plotinus' disciple and biographer, in search for 'the ways and beliefs of the Persians and Indians'. When the Emperor died on the way and the expedition came to grief, Plotinus sailed to Rome in AD 244, where he achieved great success as a teacher.

The other great representative of Neoplatonism was Diadochus Proclus, whose metaphysical outlook, like that of Plotinus, marks the final phase in the struggle of Greek paganism against Christianity at Athens, where he taught, and Alexandria, where he studied under Olympiodorus. It also marked that version of Greek philosophy which exerted a particular fascination upon Muslim minds. Other representatives of Neoplatonism during the Byzantine period include Syrianus, the teacher of Proclus, Damascius, Proclus' pupil, Simplicius and Philoponus. All those philosophers or commentators were known to the Arabs and some of their writings, sometimes lost in Greek, were translated into Arabic.

In AD 529 the Byzantine Emperor Justinian ordered the school of Athens, the last bastion of Greek paganism, to be closed. Seven of its teachers, including Syrianus and Damascius, emigrated to Persia and were well received by the Emperor Chosroes I, who was an admirer of Greek learning and the founder, in AD 555, of the School of Jundishapur which was destined to become a major centre of Greek medical and scientific studies (see Neoplatonism in Islamic philosophy §1). Subsequently, due to its proximity to Baghdad and the close political links between the Abbasids and the Persians, Jundishapur served as a staging station in the process of transmitting Greek medical and scientific learning into the Islamic world.

However, the first phase in the process of transmitting Greek learning into the Near East was the translation of theological treatises, such as Eusebius' *Ecclesiastical History* and Clement's *Recognitiones*, into Syriac. As a prelude, a series of logical texts were also translated into Syriac, including the *Isagōgē* of Porphyry, Aristotle's

Categories, *De interpretatione* and *Prior Analytics*. Beyond these, for theological reasons, the Syriac translators were not allowed to proceed.

2 Arabic translations of Greek philosophical texts

The Arab conquest of Syria and Iraq in the seventh century did not, on the whole, interfere with the academic pursuits of Syriac scholars at Edessa, Nisibis, Qinnesrin and other centres of Syriac-Greek learning. To these Christian centres should also be added Harran in Northern Syria, home of a sect of star-worshippers known in the Arabic sources as the Sabaeans and alleged to have been founded by Alexander the Great. Throughout the eighth and ninth centuries (second and third centuries AH), a new impetus was given to the translation movement thanks to the enlightened patronage of three of the early Abbasid caliphs at Baghdad, al-Mansur, Harun and his son al-Ma'mun, who founded the House of Wisdom in Baghdad to serve as a library and institute of translation. It was during the reign of al-Ma'mun that the translation of medical, scientific and philosophical texts, chiefly from Greek or Syriac, was placed on an official footing. The major translators who flourished during al-Ma'mun's reign include Yahya ibn al-Bitriq, credited with translating into Arabic Plato's *Timaeus*, Aristotle's *On the Soul*, *On the Heavens* and *Prior Analytics* as well as the *Secret of Secrets*, an apocryphal political treatise of unknown authorship attributed to Aristotle.

However, the shining star of al-Ma'mun's reign was the Nestorian Hunayn ibn Ishaq (d. AH 264/AD 873), who hailed from al-Hirah in Iraq and, jointly with his son Ishaq (d. AH 299/AD 911), his nephew Hubaysh and other associates, placed the translation of Greek medieval and philosophical texts on a sound scientific footing. The chief interests of Hunayn himself were medical, and we owe to him the translation of the complete medical corpus of Hippocrates and Galen, but Hunayn and his associates were also responsible for translating Galen's treatises on logic, his *Ethics* (the Greek original of which is lost) and his epitomes of Plato's *Sophist*, *Parmenides*, *Cratylus*, *Euthydemus*, *Timaeus*, *Statesman*, *Republic* and *Laws*. (Only the epitomes of the *Timaeus* and the *Laws* have survived in Arabic.)

The interest of Hunayn and his school in Galen, the outstanding Alexandrian physician and Platonist, is noteworthy and this philosopher-physician is a major figure in the history of the transmission of Greek learning into Arabic. Not only his sixteen books on medicine but a series of his logical and ethical writings were translated and played an important role in the development of Arabic thought. Apart from the epitomes of Plato's *Dialogues* already mentioned, his *Pinax* (list of his own writings), *That the Virtuous can Profit from Knowing Their Enemies*, *That One Should Know His Own Faults* and especially his *Ethics* have influenced moral philosophers from Abu Bakr al-Razi to Ibn Miskawayh and beyond.

Of the works of Aristotle, Hunayn's son Ishaq is responsible for translating the *Categories*, *De interpretatione*, *On Generation and Corruption*, the *Physics*, *On the Soul*, the *Nicomachean Ethics* and the spurious *De Plantis*, written by the Peripatetic philosopher Nicolaus of Damascus (first century BC). By far the most important Aristotelian treatise to be translated into Arabic during this period is the *Metaphysics*, known in the Arabic sources as the *Book of Letters* or the *Theologica* (*al-Ilahiyat*). According to reliable authorities, a little-known translator named Astat (Eustathius) translated the twelve books (excluding M and N) for al-Kindi, as did Yahya ibn 'Adi a century later. However, Ishaq, Abu Bishr Matta and others are also credited with translating some parts of the *Metaphysics*.

Equally important is the translation by Ibn Na'imah al-Himsi (d. AH 220/AD 835) of a treatise allegedly written by Aristotle and referred to in the Arabic sources at *Uthulugia* or *Theologia Aristotelis*. This treatise, which consists of a paraphrase of Plotinus' *Enneads* IV-VI, made by an anonymous Greek author (who could very well be Porphyry of Tyre), together with Proclus' *Elements of Theology* (known as the *Pure Good* or *Liber de causis*), thoroughly conditioned the whole development of Arab-Islamic Neoplatonism (see Neoplatonism in Islamic philosophy). Al-Kindi is said to have commented on the *Theologia Aristotelis* as did Ibn Sina and others, and al-Farabi refers to it as an undoubted work of Aristotle. A series of other pseudo-Aristotelian works also found their way into Arabic, including the already mentioned *Secret of Secrets*, *De Plantis*, *Economica* and the *Book of Minerals*.

Among other translators of Greek philosophical texts, we should mention Qusta ibn Luqa (d. AH 300/AD 912), Abu 'Uthman al-Dimashqi (d. AH 298/AD 910), Ibn Zur'ah (d. AH 398/AD 1008) and Ibn al-Khammar (d. AH 408/AD

1017), as well as the already-mentioned Abu Bishr Matta (d. AH 328/AD 940) and his disciple Yahya Ibn ‘Adi. None of those translators made any significant or original contribution to Arabic philosophical literature, although they laid the groundwork for subsequent developments and served as the chief purveyors of Greek philosophy and science into the Islamic world. However, there were noteworthy exceptions: Abu Bishr Matta was a skilled logician, and the Jacobite Yahya ibn ‘Adi stands out as the best-known writer on Christian theological questions and on ethics in Arabic. The Harranean Thabit ibn Qurra (d. AH 289/AD 901) was an outstanding mathematician and astronomer as well as a translator.

3 Eclecticism and the systematization of philosophical ideas

Al-Kindi, already mentioned in connection with the translation of Aristotle's *Metaphysics* and the apocryphal *Theologia Aristotalis*, should be regarded as the first genuine writer on philosophical subjects in Islam. He appears from bibliographical sources to have been a truly encyclopedic writer on every philosophical or scientific subject; his works total around three hundred, of which only a small number have survived in Arabic or Latin. He was profoundly interested in Greek thought as well as Indian religious ideas, and was a professional astrologer. His extant works, however, give the impression of eclectic and hasty composition, reflecting the influence of Socrates, Plato and Aristotle in an undefined manner. We owe to him however the first treatise on philosophical terms and definitions, modelled on Aristotle's Book Delta of the *Metaphysics*, which became in due course the model of almost all subsequent parallel treatises (see Aristotelianism in Islamic philosophy).

The first genuine system-builder in Islam, however, was al-Farabi. He was the first outstanding logician of Islam, who commented on or paraphrased the six books of Aristotle's Organon, together with the *Rhetoric* and the *Poetics*, which formed part of the Organon in the Syriac-Arabic tradition and to which the *Isagōgē* of Porphyry, also paraphrased by al-Farabi, was added. He also wrote several original treatises on the analysis of logical terms, which had no parallels until modern times. He defended Aristotelian logic against the Arabic grammarians who regarded logic as a foreign importation, doubly superfluous and pernicious (see Logic in Islamic philosophy). He also laid down the foundations of Arab-Islamic Neoplatonism in a series of writings, the best-known of which is *al-Madina al-fadila (Opinions of the Inhabitants of the Virtuous City)*. This treatise is inspired by the same utopian ideal as Plato's *Republic* (see Plato §14), but is essentially an exposition of the emanationist world-view of Plotinus to which a political dimension has been added. In that latter respect, it had hardly any impact on political developments in Islam, but it did inspire subsequent writers on political philosophy such as Ibn Bajja. Another great champion of the emanationist world-view was Abu ‘Ali al-Husayn Ibn Sina (Avicenna), who was a confessed spiritual disciple of al-Farabi.

The only great Platonist of Islam was Abu Bakr al-Razi, the greatest medical author and practitioner of the third and fourth centuries AH (ninth and tenth centuries AD). Both in ethics and in metaphysics, al-Razi exhibits a profound veneration for Plato, ‘the master of the philosophers and their leader’, as well as to the great Alexandrian doctor and philosopher Galen, whose epitomes of Plato's *Dialogues*, as we have mentioned, formed the basis of the Arabic translations of Plato's works in the third century AH (ninth century AD). Although a Manichean or Harranean influence is discernible in his thought, the ‘five eternal principles’ which form the substance of al-Razi's metaphysics and cosmology, namely the Creator (*al-Bari’*), the soul, prime matter (*al-hayula*, *hyle*) space and time, can be shown to derive from Plato's *Timaeus* and his other dialogues. The other noteworthy Platonist, especially in the realms of ethics and psychology, was a fellow Persian philosopher, Ibn Miskawayh, the best known ethical philosopher of Islam (see Ethics in Islamic philosophy §4; Platonism in Islamic philosophy).

4 The legacy of Aristotle

As already mentioned, all the works of Aristotle were translated into Arabic with the exception of the *Politics*, which for some obscure reason remained unknown to the Arabs. In addition a large number of apocryphal writings, including the *Secret of Secrets*, the *Economica*, *De plantis*, *De mundo*, the *Theologia* and the *Liber de causis* were also attributed to Aristotle. Of these works, the Organon, *On the Soul*, the *Nicomachean Ethics*, the *Physics*, the *Metaphysics*, *On Generation and Corruption* and *On the Heavens* played a decisive role in the development of logical and metaphysical ideas in Islam. However, chiefly due to the influence of the apocryphal *Theologia Aristotalis*, the tendency of early Muslim philosophers was to interpret Aristotle in Neoplatonic terms; a basic premise of this interpretation was the total agreement of Plato and Aristotle on all major issues alleged to separate them. (A famous treatise of al-Farabi entitled *al-Jam‘ bayn ra’yay al-hakimayn (The Reconciliation of*

Plato and Aristotle), probably modelled on Porphyry's lost work of the same title, illustrates this point.)

The picture radically changed with the appearance on the philosophical scene of the greatest Arab Aristotelian, Ibn Rushd of Cordoba, known in Latin as Averroes. Ibn Rushd continued the tradition of commenting on Aristotle's works initiated in Arab Spain by Ibn Bajja (Avempace) and in the East by al-Farabi. Ibn Rushd, however, produced the most extensive commentaries on all the works of Aristotle with the exception of the *Politics*, for which he substituted the *Republic* of Plato. These commentaries, which have survived in Arabic, Hebrew or Latin, earned him in the Middle Ages the title of the Commentator, or as Dante put it in *Inferno* V. 144, 'che'l gran commento feo' (he who wrote the grand commentary). Ibn Rushd actually wrote three types of commentaries, known as the large, middle and short commentaries, on the major Aristotelian treatises, notably the *Physics*, the *Metaphysics*, the *Posterior Analytics*, *On the Soul* and *On the Heavens*. In addition, he defended Aristotle against the onslaughts of al-Ghazali, the famous Ash'arite theologian, in a great work of philosophical debate entitled the *Tahafut al-tahafut (Incoherence of the Incoherence)*, a rebuttal of al-Ghazali's *Tahafut al-falasifa (Incoherence of the Philosophers)*.

5 Presocratic and post-Aristotelian philosophers

The records of the early Greek philosophers in Arabic, such as al-Sijistani's *Siwan al-hikma (Vessel of Wisdom)* and al-Shahrastani's *al-Milal wa'l nihal*, usually begin with the Seven Sages, followed by a list of the Presocratics, including Thales, Anaxamines, Anaximander, Democritus, Pythagoras and Heraclitus, with very brief accounts of their views, which are invariably given a religious and mystical twist. This is particularly true of Empedocles and Pythagoras, who are said to have received 'wisdom' (*hikma*) from Semitic sources, notably Luqman and Solomon, and to have asserted as genuine Muslims *avant la lettre* the unity of God, the creation of the world and the resurrection.

Of the post-Aristotelian philosophers, Chrysippus is almost the only Stoic philosopher mentioned; Zeno of Citium is almost unknown, despite the significant influence of Stoicism both in logic and in ethics on the early philosophers and theologians. Diogenes the Cynic (see Diogenes of Sinope), often confused with Socrates, is represented as a key moral and ascetic figure, but of the latter Stoic philosophers such as Cicero, Epictetus and Marcus Aurelius, no mention is made in the classical Arabic sources. Of the materialists, only the names of Democritus and Epicurus are mentioned. The impression one gains from reading these sources is that Greek philosophy had, according to the authors, reached its zenith with Aristotle, who superseded his predecessors in such a way as to render them superfluous. Ibn Bajja, for instance, in his paraphrase of the *Physics* of Aristotle, justifies his total omission of the views of the Presocratics on the grounds that Aristotle had refuted their 'dialectical' views and therefore it was unnecessary to dwell on them, a position which al-Ghazali had also adopted in his *Tahafut al-falasifa*. As his target, al-Ghazali chose Aristotle to the exclusion of all others, on the ground that 'he (Aristotle) had refuted all his predecessors, including his teacher, whom they nickname Plato the Divine. Then he excused himself for disagreeing with his teacher, saying: "Plato is a friend and the truth is a friend, but truth is a greater friend than Plato"' (an obvious paraphrase of *Nicomachean Ethics* I). Of Aristotle's Greek commentators, the Arab historians of ideas and philosophers refer frequently to, or quote from, the writings of Alexander of Aphrodisias, Themistius, Olympiodorus, Simplicius, Philoponus and Nicolaus of Damascus (first century BC). The earliest commentators, such as Theophrastus (d. 288 BC) and Strato (d. *c*.269 BC), were virtually unknown to the Arabs.

The chief historical significance of the Muslim-Spanish phase in the rise and development of Muslim philosophy is that it served as a major link in the transmission of Greek philosophy to Western Europe. The Muslims had been the custodians of that philosophy, which had been almost completely forgotten in Western Europe since the time of Boethius, who was responsible chiefly for translating the Aristotelian logic into Latin. By the end of the twelfth century, the translation of Arabic philosophical, scientific and medical works into Hebrew or Latin by such eminent scholars as Gerard of Cremona, Michael Scot and Herman the German (see Translators) had wrought a genuine intellectual revolution in learned circles. The most influential Muslim philosopher to leave a lasting impression on Western thought was Ibn Rushd (Averroes). During the thirteenth century, philosophers and theologians split into two rival groups, the Latin Averroists with Siger of Brabant and Boethius of Dacia at their head, and the anti-Averroist group led by Albert the Great and Thomas Aquinas (see Averroism). The confrontation between these two groups became so violent that in the second half of the thirteenth century the

Bishop of Paris, Étienne Tempier, had to intervene and in 1270 and 1277 issued ecclesiastical condemnations of a total of 219 propositions which were of Aristotelian or Averroist inspiration (see Aristotelianism, medieval). It should be noted, however, that it was thanks to the Latin translations of Ibn Rushd's commentaries that the rediscovery of Aristotle in Western Europe and the concurrent emergence of Latin Scholasticism, one of the glories of late medieval thought, were made possible.

Green political philosophy

All the major political philosophies have been born of crisis. Green political philosophy is no exception to this general rule. It has emerged from that interconnected series of crises that is often termed 'the environmental crisis'. As we enter the third millennium and the twenty-first century it seems quite clear that the level and degree of environmental degradation and destruction cannot be sustained over the longer term without dire consequences for human and other animal species, and the ecosystems on which all depend. A veritable explosion in the human population, the pollution of air and water, the over-fishing of the oceans, the destruction of tropical and temperate rain forests, the extinction of entire species, the depletion of the ozone layer, the build-up of greenhouse gases, global warming, desertification, wind and water erosion of precious topsoil, the disappearance of valuable farmland and wilderness for 'development' - these and many other interrelated phenomena provide the backdrop and justification for the 'greening' of much of modern political thinking.

The task of outlining and summarizing the state of green political philosophy is made more difficult because there is as yet no agreement among 'green' political thinkers. Indeed there is, at present, no definitive 'green political philosophy' as such. The environmental or green movement is diverse and disparate, and appears in different shades of green. These range from 'light green' conservationists to 'dark green' deep ecologists, from ecofeminists to social ecologists, from the militant ecoteurs of Earth First! to the low-keyed gradualists of the Sierra Club and the Nature Conservancy. These groups differ not only over strategy and tactics, but also over fundamental philosophy.

While there is no single, systematically articulated and agreed-upon green political philosophy, however, there are none the less recurring topics, themes, categories and concepts that are surely central to such a political philosophy. These include the idea that humans are part of nature and members of a larger and more inclusive 'biotic community' to which they have obligations or duties. This community includes both human and non-human animals, and the conditions conducive to their survival and flourishing. Such a community consists, moreover, not only of members who are alive but those who are as yet unborn. A green political philosophy values both biological and cultural diversity, and views sustainability as a standard by which to judge the justness of human actions and practices. Exactly how these themes might fit together to form some larger, systematic and coherent whole is still being worked out.

1 Political philosophy and green political philosophy

Green political philosophy is the attempt to think clearly and systematically about the political and ethical aspects of environmental issues and problems. Just as political philosophy is a sub-species of philosophy, so green political philosophy is a sub-species of political philosophy. Political philosophy is the attempt to think systematically about the ethical and political problems that arise in the course of living together (see Political philosophy, nature of). Green political philosophy is the attempt to think systematically about those problems and prospects as they are reflected and refracted through the lens of an 'ecological' or 'environmental' perspective.

An environmental perspective places the natural environment at the centre of attention and concern. It sees human beings as one of many species, and views all as interdependent and dependent on the integrity, stability and carrying capacity of the ecosystems that sustain human and non-human animals alike. Humans are members of a community whose boundaries are both wider than and different from those of conventional political communities. As Aldo Leopold puts the point in his now-classic *A Sand County Almanac* (1949: 240): 'a land ethic changes the role of *Homo sapiens* from conqueror of the land-community to plain member and citizen of it. It implies respect for his fellow-members, and also respect for the community as such'. An environmental perspective also recognizes that there are natural limits to human activity and endeavour. Thus one may not, for example, extract more energy from an ecosystem than is required to sustain it, that is, without that ecosystem ceasing to function well, or at all. 'Sustainability' thus becomes a standard for assessing the rightness or wrongness of human activities, practices and interventions in natural processes. As Leopold observes: 'A thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it tends otherwise' (1949: 260). (Whether this is to commit the 'naturalistic fallacy' of deriving 'ought' from 'is', is discussed in Callicott (1989).)

An environmental or green political philosophy questions a number of conventional philosophical views. It is especially critical of the anthropocentric or 'humanist' bias of much of Western philosophy, that puts human beings at the apex of creation. Whether it is because we humans are created in God's image, or are alone capable of rational thought and speech, or belong (as Kant put it) to the kingdom of ends, we have set ourselves apart from, and above, nature and its myriad species. On the conventional view, nature and non-human animals are means to human ends and endeavours. Many Western (and some non-Western) thinkers have held humans to be superior to 'lesser' creatures and have seen the natural environment as a cornucopia of 'resources' for our use and enjoyment.

If this is the conventional view, then green thinking is, by implication, unconventional. It offers alternative ways of thinking about nature and our species' place in - and responsibility for - the natural world. Much of modern green philosophizing takes the form of a critique of conventional ways of thinking about nature, as a prelude to thinking anew about our species' place in the natural order (see Ecological philosophy §3). Let us consider several specific ways in which we are asked to think anew about these matters.

2 A green theory of value

The green theory of value holds that the worth of some things does not derive solely from human assessments of their utility or beauty, and still less from their price or market value (see §5 below). Some things have intrinsic value; that is, they are valuable in and of themselves, quite apart from any human estimate of their worth or any value they might have as means to some other end. This is especially true, some greens argue (see for example Goodin 1992: 30-41), of certain natural objects or entities. For example, wilderness *per se* has no instrumental value; indeed, it is often called 'wasteland'. Locke put the point well in the second of his *Two Treatises of Government* (1690: para 42): 'land that is left wholly to nature, that hath no improvement or pasturage, tillage, or planting, is called, as indeed it is, waste; and we shall find the benefit of it amount to little more than nothing'. Nor of course is Locke alone in taking this view; he merely articulates a pervasive - and decidedly anthropocentric - view of the value of cultivated versus uncultivated land. Against Locke and other like-minded thinkers, environmentally minded philosophers maintain that wilderness has value in itself, and for the non-human creatures whose haven it is. Likewise, many of these species - the northern spotted owl, for example - have no instrumental or market value; they are not a means to any human end, nor are they sold or traded in any market. And yet all are valuable and worth protecting, for all have a place and a function in their respective ecosystems.

Greens tend to reject, with widely varying degrees of rigour, the anthropocentric view that human needs and wants supply the only standard of value or worth. They opt instead for one or another version of the biocentric view that the health and wellbeing of the biotic community - for example, an ecosystem and the myriad species it sustains - takes precedence over any of its individual members. This amounts to a conception of value that is both naturalistic and holistic; that is, it takes nature - and not one of its creatures, namely man - as the source and measure of value; and it views all creatures as part of a larger, life-sustaining whole. Some dark green thinkers, especially those calling themselves 'deep ecologists', say that this new way of thinking requires a radical shift in perspectives - roughly, from a hierarchical pyramid with humans at the apex, to an interdependent web in which humans are but one species amongst many (Devall and Sessions 1985) (see Environmental ethics).

Not all green thinkers agree, however. Indeed, some - including 'social ecologists' such as Murray Bookchin (1990) - are highly critical of any attempt to make *Homo sapiens* merely one species among many. Such a view would, they contend, diminish the value of human beings more than it would re-value nature. And such a view would fail to recognize that, like it or not, human beings, because of their knowledge and technology, have a disproportionate power over nature and its creatures, and therefore disproportionate responsibility for the health and wellbeing of both. To see the human species as co-equal with other species is to be blind to this exceedingly important - and indeed unique - aspect of human existence.

This in turn introduces another 'green' theme: the use and abuse of scientific knowledge and technology. Much of Western thought since the scientific revolution of the seventeenth century has tended to celebrate the increasing power of the human species over nature. Sir Francis Bacon and other seventeenth-century philosophers saw science and technology as means of mastering or dominating nature for human ends (Leiss 1972). Variations on this view can be found among later thinkers. Karl Marx, for one, looked forward to the pacification or 'humanization' of nature which modern science made possible. The productive forces - roughly, natural resources and the technology used to turn them into objects useful to humans - that were developed under capitalism have

transformed nature beyond all recognition, and that, Marx thought, was a commendably progressive development (see Marx, K.).

Right and left, capitalist, communist, conservative or liberal, Western political philosophers have for the most part embraced and celebrated the 'conquest' or 'pacification' of nature for human purposes. Green political philosophers have, by contrast, been highly critical of any philosophy that views nature only as a 'resource base' or a means to human ends and is, in consequence, heedless of the conditions conducive to the health and wellbeing of nature's myriad species.

In different ways and with different emphases, green political philosophers generally subscribe to what one might call a 'systemic' or 'ecological' view of value. Some things, as noted already, have intrinsic value as ends in themselves. Others, by contrast, have value by virtue of the contribution they make to a larger whole. The value of such a thing is determined by its place in, and contribution to, some larger functional whole - an ecosystem or (in Leopold's phrase) a biotic community. Thus, for example, certain predator species - for example wolves - have value not only in themselves but because of their function within the ecosystem of which they are an integral part. Wolves cull sick, lame or deformed deer; by preventing the weaker members of the deer population from reproducing, wolves actually benefit that species. And by controlling the deer population wolves protect the larger ecosystem which both share with other species. This green view of value is directly contrary to the conventional view - long established in law and public policy in North America - that wolves and other predator species should be trapped or shot (and bounties paid to trappers and hunters) because predation is cruel, wanton, wasteful and without value to human beings.

But what, exactly, is 'political' about predators and prey, about anthropocentric versus biocentric conceptions of value, and the like? The most obvious answer, of course, is that laws, rules, regulations and government policies on environmental matters must be made on the basis of our beliefs about nature and its creatures. These include laws and public policies concerning mining and forestry, tourism and economic development, land use and property rights, motorway construction, parks and recreation, re-forestation, the preservation of wilderness, the protection of endangered species, and many other matters. Some of the most heated and hard-fought political battles of the modern age have been concerned with these and other broadly environmental issues.

These matters are also 'political' in a second, and much older, sense. For politics is concerned (as Aristotle famously put it) with the good life and the conditions conducive to it. But while Aristotle was concerned with the good life as lived by (some) human beings, modern greens cast their net more widely, to include non-human creatures and the biotic communities they share with human beings. And still, in our day as in Aristotle's, what constitutes or counts as the good life is hotly disputed amongst philosophers.

Contemporary political debates and divisions over environmental issues are, as often as not, based on philosophical differences over value (anthropocentric versus biocentric; instrumental versus intrinsic), over what counts as the good life, over the proper place and role of human beings in the natural order, over obligations to non-human creatures and future humans, and so on. A green political philosophy is simply the attempt to articulate and justify a biocentric view of the good life for human beings and for other creatures with whom they share a common planet.

What will count as the good life for fish will of course differ from what counts as the good life for monkeys. But what all creatures share is an interest in a healthy habitat. Fish and frogs have an interest in clean or unpolluted water, monkeys in intact tree canopies, whales in plankton, koala bears in eucalyptus trees, and so on. They need not know or be consciously cognizant that they have an interest in these things in order to actually have an interest, since being aware that one has a need for or interest in X is not a necessary condition for having an interest in X (see Needs and interests §1).

Humans are of course able to know, as non-human animals are not, what is required to sustain non-human species. This confers upon humans the 'epistemic responsibility' that comes with knowing what members of other species do not or cannot know. Our knowing what conditions are conducive to some species' survival and flourishing confers upon our species an added measure of responsibility. More specifically, it requires that we recognize, and not wantonly disregard, the interest such a species has in the conditions conducive to its survival and flourishing (Johnson 1991, ch. 6). Our ever-expanding knowledge of the natural world brings with it an expanded

responsibility to recognize the interests (some greens go further, and say ‘rights’) of other creatures. And while we may not always be able to promote these interests, we must, as moral and political agents, at least accord them serious consideration (see Animals and ethics).

A green political philosophy expands the circle of value and moral concerns not only spatially, so to speak - to include non-humans - but also temporally, to include generations of human beings who are as yet unborn. A green political philosophy - and a green theory of value in particular - places posterity on a par with people now living. Our distant descendants are our moral equals, their happiness and wellbeing as valuable as our own (see Future generations, obligations to).

3 Green political agency

If the green theory of value sets the ends, the green theory of political agency offers an account of the means to achieve those ends. A theory of agency operates at two levels. The first, and more fundamental, level is individual agency, which specifies the characteristics of individual agents; the second, and derivative, level is that of collective agency, which describes the main features of organizations and institutions within which individual agents work. Taken together, these two features of a theory of agency supply an account of the kinds of actors and institutions that would be required to achieve the ends stipulated by a green theory of value (Goodin 1992, ch. 4). Two questions are particularly pertinent. The first is: what kinds of agents - that is, political actors or citizens, consumers and so on - are best suited for realizing green ends? The second is: what kinds of political organizations or institutions, what form of government, and what strategies and tactics are most likely to implement green values?

First, at the individual level: green agents or political actors must be motivated by a love of and respect for the natural world, of which they are a small but important and morally responsible part; their satisfactions and pleasures will not, in the main, be materialistic; their wants will be satisfiable in sustainable ways; they will act in nonviolent ways; their time horizon will typically extend further than their own and one or two adjoining generations.

There is, as some have noted, nothing all that new or novel in this picture of green political agency. It is a picture painted, with many minor variations, by philosophers from Plato onward, of the good man and the good citizen motivated by a vision of the good life (O’Neill 1993, ch. 1). The good life for humans consists of appreciating the superiority of spiritual and intellectual satisfactions over material ones, of getting outside ourselves, as it were, to care about something larger and longer-lived than our own mortal selves. And how better to do this, greens ask, than recognizing our place in, and responsibility to care for, the natural world? (Passmore 1980).

A second set of questions concerns collective agency. What kinds of political organizations, institutions and strategies might best achieve green goals? Here again green thinkers differ amongst themselves. Most greens tend to believe that the most desirable and effective institutions are broadly democratic, decentralized and participatory (see for example Porritt 1984; Dobson 1990). Others are more sceptical, suggesting that solutions to environmental problems require the kind of coordination that can come only through the modern state, its allied agencies and cooperation between states (for example, Ostrom 1991; Goodin 1992). Others are more sceptical and despairing still, arguing that environmental crises are apt to be so numerous, so pervasive and so severe as to require the harsh interventions of an authoritarian, hierarchical, and not necessarily democratic, state (for example Heilbroner 1975; Ophuls 1977; Catton 1980). Such dire predictions and prescriptions, in combination with the radical beliefs of some militant environmentalists, have led some critics to suggest that there is a historical, if not a logical, link between green political thought and fascist or Nazi-like political practice (Bramwell 1989; Pois 1986).

This last criticism relies for its force on a single historical case. Certainly it is true that some Nazis did indeed embrace green themes, values, beliefs and attitudes not unlike those held by some amongst the more militant and mystical greens (nature goddess worship, a marked hostility toward the natural sciences and so on). And this fact should give self-critical and reflective greens some pause. But it does not follow, of course, that anyone who subscribes to green values is a Nazi. To claim otherwise is analogous to arguing that: ‘Nazis loved dogs; therefore dog-lovers are Nazis.’

A more serious set of questions concerns the shape and structure of green political institutions. For example, are the interest-group politics of Western liberal democracy well-suited to achieving environmental ends? Ought

greens to organize themselves into parties and pressure groups? If so, should they nominate candidates for election to public office and lobby on behalf of their green agenda? Or should greens remain a broad-based movement, aloof from party politics and pressure-group tactics?

Such questions admit of no easy answers and are hotly debated amongst greens. In two-party systems such as the USA, third parties have little hope of success, and the best bet might be to try to influence the platforms and policies of the major parties. In multi-party parliamentary systems, by contrast, it might be more rational to organize green political parties - as has been done in the UK and Germany, for example, albeit without notable electoral success.

Some of the more militant greens hold that conventional party politics will not suffice and that direct action - civil disobedience, protest marches and demonstrations, even ‘ecotage’ or ‘monkey-wrenching’ - is required (see Civil disobedience §2). Such action is politically and morally justifiable, its defenders say, if it is nonviolent. Thus, for example, motorway construction and the destruction of wildlife habitat may be slowed or stopped by nonviolent civil disobedience. By drawing public attention to such issues, protestors hope to educate or ‘raise the consciousness’ of their fellow citizens so as to put pressure on their political representatives, planners and policy makers. Some more militant green activists advocate such tactics as monkey-wrenching (the disabling of machinery), the destruction of surveyors’ stakes, the ‘spiking’ of old-growth trees to prevent their being cut. The arguments for and against such measures have been a lively topic of political and philosophical debate amongst environmentalists (Goodin 1992: 133-5).

Arguments about strategies, tactics, and institutions are arguments about agency, both individual and collective, and constitute an important aspect of green political philosophy.

4 Green economic thought

A green view of economic relations is an integral part of a green political philosophy, its theory of value, and its theory of individual and collective agency. In the main, green economic thinking represents a critique of, and a challenge to, much of conventional market-based economic thought - especially in so far as such thinking forms the basis and justification for present-day policies regarding energy and other broadly environmental issues.

What is wrong with modern economic thought, green critics contend, is that it knows the price of everything and the value of nothing. Or, perhaps more accurately, it is mistaken in assuming without argument that everything has a price, even if some things are not actually traded in any market. Three features of green economic thought merit special mention. The first is its critique of, and alternative to, the practice of assigning ‘shadow prices’ to goods not traded in markets. The second concerns the practice of ‘discounting’ the welfare of future generations via a ‘social discount rate’. And the third is the green questioning of the use of cost-benefit analysis in making and justifying political decisions and policies.

Conventional economic thinking translates the question, ‘What is the value of X?’ into another question, ‘What is the price of X?’ That is, what would X be worth in monetary terms, if it were to be traded in a market? Now clearly, since some things are not bought and sold, some way must be found for determining their price. Some economists contend that so-called ‘shadow prices’ can be assigned to such goods as clean air, scenic beauty, the preservation of a particular species, and so on. The hypothetical price is determined by asking people what they would be ‘willing to pay’ to (for example) preserve the Grand Canyon or to prevent the extinction of an entire species of plant or animal. By this means it should be possible to ascertain the economic value of these and other ‘environmental’ goods.

The problem with the practice of shadow pricing, say critics (see for example Sagoff 1988), is that it cheapens things that are beyond price, that is to say, literally priceless. To ask what someone would be willing to pay for being treated with respect would thereby demean the very idea of kindness and respect. Some things actually lose value (and, arguably, all meaning) when they are bought and sold. Such is the case, critics argue, when a price, even a hypothetical one, is put on species, ecosystems and other natural entities.

A second, and scarcely less controversial, practice is that of discounting the wellbeing of future generations by means of the social rate of discount. Roughly, the idea is this: just as individuals discount their own future, so too does an entire society at some time discount its future members’ welfare at all later times. And, just as it is rational

for individuals to discount their own future wellbeing, so it is rational for one generation to discount the welfare of future generations.

The green critique of social discounting is easily summarized. It is one thing to discount one's own future wellbeing; it is a morally much more questionable matter to discount other people's wellbeing. I am not entitled, rationally or morally, to discount your future wellbeing at my personal rate of discount. And yet that is precisely what defenders of social discounting attempt to do. One's moral worth does not vary according to one's place in the temporal order of succession. I am not entitled to discount your wellbeing, whether you are my contemporary or my very distant descendant. The practice of social discounting, its critics claim, works to the distinct disadvantage of future generations and is clearly unjust (Cowen and Parfit 1992; Cowen 1992; O'Neill 1993, ch. 4).

The practice of social discounting, when combined with other economic tools or techniques, such as cost-benefit analysis, further disadvantages future people (O'Neill 1993, chs 4 and 5). Consider, by way of example, the claim that nuclear power is preferable to other alternatives because it has a higher benefit-to-cost ratio. In practice, however, the benefits - including access to cheap and plentiful electricity - accrue to those now living, whilst the costs will be borne by future people, in the form of increased risk of radiation exposure. To measure the benefits over the short term and the costs over the longer term is systematically to disadvantage future people.

It is important to note that this is not an argument against cost-benefit analysis *per se* or in principle, but against taking a too-constricted time horizon over which to measure costs and benefits. If the wellbeing of future people is not discounted, and the benefits not enjoyed exclusively by one generation while the costs are borne by another, then cost-benefit analysis can be a useful tool of analysis, even for environmentally minded policy analysts, legislators and concerned citizens.

Greens tend to be critical of conventional economic thinking, and particularly of the view that market allocations of valued goods are always fair or necessarily just. This does not mean, however, that all greens are therefore socialists of one or another stripe (although some certainly are). Green economic thought is at present more critical than constructive - more articulate about what is wrong with modern market economics than what alternative system might be devised (see Market, Ethics of the).

5 Conclusion

The task of a green political philosophy is twofold. It is critical in that it aims to expose and criticize the flaws, fallacies and contradictions that lurk in conventional ways of thinking about human beings and their proper place in the natural world. And it is constructive in that it aims to sketch the contours and outline the institutions of a society that values the natural world, practises sustainability and concerns itself with the longer-term consequences of present-day policies and practices. Much of the critical groundwork has now been laid, but the task of constructing a coherent, systematic and persuasive political philosophy has only just begun, and remains a task for the twenty-first century.

Green, Thomas Hill (1836-82)

Green was a prominent Oxford idealist philosopher, who criticized both the epistemological and ethical implications of the dominant empiricist and utilitarian theories of the time. He contended that experience could not be explained merely as the product of sensations acting on the human mind. Like Kant, Green argued that knowledge presupposes certain a priori categories, such as substance, causation, space and time, which enable us to structure our understanding of empirical reality. Physical objects and even the most simple feelings are only intelligible as relations of ideas constituted by human consciousness. However, unlike Kant, he did not draw the conclusion that things in themselves are consequently unknowable. Rather, he argued that reality itself is ultimately spiritual, the product of an eternal consciousness operating within both the world and human reason. Green adopted a similarly anti-naturalist and holistic position in ethics, in which desires are seen as orientated towards the realization of the good - both within the individual and in society at large. In politics, this led him to criticize the laissez-faire *individualist liberalism of Herbert Spencer and, to a lesser extent, of J.S. Mill, and to advocate a more collectivist liberalism in which the state seeks to promote the positive liberty of its members.*

1 Life and works

Green was born in Birkin, Yorkshire, on 7 April 1836, the fourth child of the Reverend Valentine Green. His evangelical religious views played a profound part in his later philosophy, alienating the orthodox but having a great appeal for those seeking a rational basis for Christianity that was compatible both with Darwinism and the new historical scholarship, which were then calling traditional beliefs into question, and which issued in a broadly humanist social ethic. He was educated first by his father and then, from the age of 14, at Rugby School, where the future Cambridge philosopher Henry Sidgwick was also a pupil. He went up to Balliol in 1855, coming under the influence of Benjamin Jowett, who introduced him to German as well as Greek philosophy. He took a First in Greats in 1859, and was elected to a college fellowship the following year. In 1863 he refused the editorship of the *Times of India* and in 1864 was an unsuccessful candidate for the chair in philosophy at the University of St Andrews, largely due to his religious opinions. He served as an assistant to the Schools Inquiry Commission in 1865 and 1866, and was later involved in the founding of Oxford School for Boys. From 1866, he became heavily involved in college business and was the first Tutor not to be enrolled in holy orders. Together with Jowett, he played a prominent role in the university reforms that were to orientate the curriculum towards the needs of modern society and to professionalize academia. Green has been described as the first professional philosopher in the modern sense, and he influenced the emergence of a new kind of hard-working undergraduate, who viewed a degree as a qualification for a career, with Greats in particular becoming a training for politics or the imperial civil service.

The Philosophical Works of David Hume, edited with T.H. Gross, appeared in 1874-5. Green’s long introduction contained his critique of empiricism and naturalism in Locke and Hume, an argument that was extended to J.S. Mill,Spencer andLewes in subsequent articles. He had failed to get elected as Waynflete Professor in 1867, but in 1878 became Whyte’s Professor of Moral Philosophy. He took his lecturing duties seriously and his best-known books, the *Prolegomena to Ethics* (1883) and the *Lectures on the Principles of Political Obligation* (1886), were both published posthumously on the basis of his lecture notes. Many of his other essays, including the important ’On the Different Senses of "Freedom" as Applied to Will and to the Moral Progress of Man’, similarly originated as lectures and likewise only appeared with the publication of his collected works after his death.

Green played an active part in radical liberal politics, supporting John Bright and the cause of the North in the American Civil War. He was a prominent member of the temperance movement from 1872, and in 1876 was the first Oxford academic to be elected to the city council as a representative of the town rather than the University. Together with his wife Charlotte Symonds, whom he married in 1871, he participated in the University extension movement and in attempts to open up higher education to women. His lecture *Liberal Legislation and Freedom of Contract* (1881) has often been taken as providing the philosophic basis for the shift from *laissez-faire* to social liberalism at the turn of the century. He died prematurely on 26 March 1882.

2 Critique of empiricism and naturalism

Green first presented his own theory in terms of a critique of the native empiricist tradition of Locke,Hume and

their nineteenth-century followers. For Green, the heart of the empiricist project lies in the contention that ideas arise from sensation. According to this thesis, at least as Green understood it, a distinction is made between those ’simple’ ideas that the mind passively receives through the sensory mechanisms, and ’complex’ ideas that result from reflection upon these basic notions and the combinations which the mind performs between them. The crux of Green’s criticism consisted in denying the validity of this distinction. Drawing on Kant, he claimed that what he calls ‘formal conceptions’, such as subject and object, or cause and effect, cannot be derived from simpler ideas stemming directly from sensation because even our most basic notions presuppose these more complex concepts. For example, knowledge of cause and effect cannot be acquired (as Green held that Locke maintained) through reflection on the circumstances under which things come to exist, because the very idea of an external thing can only be derived from sensations if we already conceive of them as being caused by outer objects. A conception of causation is therefore intrinsic to our knowledge of those very objects from which we are supposed to obtain it. Green found additional evidence of the circularity of the empiricist argument in the tendency to equivocate over whether simple ideas are the result of mere feelings or feelings that already have certain properties built into them, such as notions of space or blueness. If the latter, then the empiricist has simply assumed what needs to be explained. If the former, then there remains the difficulty that the simple ideas from which we allegedly develop our more complex ideas seem to require such notions for us to be able to conceive of them in the first place.

From this critique, Green drew the conclusion that conscious experience could not be accounted for in terms of a succession of passively received feelings that act upon us in much the same way as certain climatic or chemical changes act on a plant and cause it to pass through a number of different physical states. Mind or consciousness had to be ascribed an active role from the beginning. On this view, feelings or sensations can only be experienced in the relevant sense of constituting knowledge if they are present to a self-conscious mind that is distinct from them and is capable of relating them to each other. Green insisted that one could not even conceive of a present and immediate sensation without relating it to other general notions of immediacy, presentness and sensation that denied its particular character.

This emphasis on relations is vital to Green’s argument and was later taken up by F.H. Bradley (see Bradley §5). For Green, ’formal conceptions’ or any kind of general notion are essentially relations. However, this does not imply that there are ideas or objects that exist independently of relations. Thought does not simply relate things that are already there. His thesis is essentially holistic, in which a single self-consciousness mind is regarded as constituting the world as part of a unified system of mutually related and entailed elements. Thus, particulars always stand in relation to something else, and are real only in so far as they form part of those relations. Likewise, general categories exist only in so far as they comprise relations. This inter-relatedness of universal and particular is generally known as the doctrine of the concrete universal.

Much of Green’s argument can be characterized as broadly Kantian. Indeed, Green identified his principle of consciousness with Kant’s synthetic unity of apperception. However, he went beyond Kant in denying that there are ’things-in-themselves’ that mind plays no role in constituting (see Kant, I. §5). Green believed that in this respect Kant had failed to take his critique of Humean empiricism far enough. He held that Kant regarded the noumenal world as totally inaccessible to thought, and charged this position with incoherence on the grounds that such a world would be unknowable and so it would be impossible to say whether it existed and hence was antithetical to thought in the first place. Denial of the noumenal world, however, raises the problem of solipsism. If mind constitutes reality, does that mean that there are as many worlds as there are individual minds? Or do our individual minds somehow collaborate together to create the phenomenal world? Green rejected both these suggestions to argue that reality itself is the product of a single, eternal self-conscious mind which manifests itself, albeit incompletely, in individual human minds. Green’s religious beliefs play a major role in his argument at this point - in particular, the view that the essence of Christianity is that human beings partake in some measure in the divine spirit. As we saw, Green contended that this single eternal Mind unifies the whole of reality, relating every part to every other part. No single element exists or can be known, therefore, except in relation to everything else. As a consequence, human knowledge will always be incomplete, although for the divine consciousness, which is omniscient, all relations are known and hence, Green believed, necessary.

3 Ethics and politics

Green’s ethics follows on from his critique of naturalism. Here his target is utilitarianism, which he regarded as

intimately bound up with empiricist epistemology and a hedonist psychology. A utilitarian morality of this kind holds that human beings are motivated by the pursuit of pleasure and the avoidance of pain. However, Green argued that even those forms of happiness that originated in purely animal wants or impulses could only become objects of conscious human desire if they are related to an ideal of self-perfection describing the sort of person one ought to be and a corresponding conception of the good. We cannot derive our view of morality from pleasure, any more than we can acquire other forms of knowledge from different kinds of sensations. The experience of pleasure presupposes notions of good and bad in exactly the same way as different sensations are bound up with other ‘formal conceptions’.

Green maintained that we can only conceive of and actively pursue self-perfection within a society, for our sense of personal identity arises out of our relations with others, for instance in the various professional, familial and other social roles which we perform or to which we aspire. As a result, the goals which we come to pursue will be similarly tied up with how we relate to others. The only good that can foster and preserve the relations between individuals is a common good which is non-competitive in nature and the attainment of which by each promotes that of everyone else. Such a good cannot be conceived in material terms but is rather a state of mind or character. Toleration provides an example of what Green had in mind, since tolerance is a good that can only be understood as a social relation between two or more persons, and each individual’s aiming to be tolerant fosters the ability of everyone else to be so.

The origins of this argument are firmly located in his metaphysics and his holistic account of reality as a system of necessary relations. It is important to stress that Green never treats society as a collective subject. He regarded any suggestion that society and the common good might be distinct from or superior to its individual members and their particular goods as being as meaningless as attempts to establish the converse.

Green’s conception of positive liberty, his main contribution to political philosophy, is closely tied to his ethics. Green associated a purely negative conception of freedom, as the absence of external physical constraints, with a naturalistic view of human beings as driven by innate impulses and appetites which they sought to satisfy in the pursuit of various material goods. As we have seen, he disputed this conception of human motivation. He also believed that it issued in an atomistic and ultimately incoherent view of society, since it failed to offer a satisfactory account of social relations. Negative liberty was the freedom of Hobbes’ state of nature, of the war of all against all. Positive freedom, in contrast, was the attempt to secure the conditions for the self-realization of all. It was orientated towards a common, moral good, rather than purely individual, material goods. Green noted that both negative liberties and certain material conditions formed preconditions for the attainment of this moral freedom. A moral action had to issue from a free will and be voluntarily performed on Green’s somewhat Kantian account, so that individuals needed to be protected from undue coercion by others. However, he also claimed that some obstacles were insurmountable by individual action alone, so that public education and welfare legislation were also necessary.

In this way, Green’s ethical theory fed into a progressive liberal politics, and he defended measures such as the Factory Acts, regulating conditions at work, on these grounds. He argued that properly understood freedom of contract entailed a mutual recognition of positive rights guaranteeing certain standards of safety, remuneration and limiting hours rather than just the negative right to sell and hire labour freely. He rejected both the minimal state of *laissez-faire* liberals such as Spencer and the conception of the state as the monopoly holder of force, which he associated with Hobbes and J. Austin (see Liberalism §1). Rather, he argued that the state’s role consists in coordinating the complex relations between the various institutions and individuals that comprise it. Our obligation to the state is moral and stems from a consciousness of its function in promoting certain common ends. Rights are neither natural properties of individuals nor positive enactments of the sovereign power, but grow out of a mutual awareness of those common goods necessary for the fullest degree of self-realization by all. He held that our understanding of the nature and purposes of the state has steadily broadened, as our consciousness of the common good and the resulting rights stemming from the relations between individuals has developed. Some governments may move more slowly than others in responding to this greater awareness among the people, and in such cases civil disobedience or even revolution might be justified. Green used these arguments to support the North in the American Civil War, Giuseppe Mazzini’s movement for national liberation in Italy, and the campaign for suffrage reform in Britain.

Critics, such as Isaiah Berlin, have complained of two major problems with Green's advocacy of positive liberty. First, they have argued that there are a number of different moral goals that it may be rational to pursue and these are not always compatible or commensurable with each other. Second, they have noted that the welfare goods advocated by Green are capable of being objects of competition. Education, for example, can give someone a positional advantage when it comes to getting a given job. Both these objections suggest that social relations are liable to be less harmonious than Green supposes and that an attempt to coordinate all forms of self-realization will either prove incoherent or totalitarian. Green disputed the validity of these sorts of criticism at both a metaphysical and a practical level. While he asserted that ultimately all forms of genuine human self-perfection prove mutually supportive, he insisted that full consciousness of these relations was only accessible to God. However, he did believe that human beings were capable of making progressive steps towards such a perfected state. Nevertheless, moves in this direction always had to come from below, since morality could not be imposed.

It is undeniable that an optimistic teleology underlies his thesis, in which the widening area of state action and social cooperation results from the gradual diffusion of reason and self-consciousness among the general public. The ambivalences of Green's position come out clearly when the people failed to move in the direction he desired. One prime example is temperance reform, for which Green ultimately abandoned schemes for voluntary abstinence and advocated the compulsory prohibition of alcohol.

Green's political writings had an important impact at the time, influencing a whole generation of British liberal politicians and theorists, such as L.T. Hobhouse and J. Hobson. His arguments, however, are deeply embedded in a metaphysics the religious assumptions of which came to seem increasingly dated and questionable.

Gregory of Rimini (*c*.1300-58)

Gregory of Rimini was for a long time known primarily for his doctrine of predestination and for his notion of 'the complexly signifiable' in the semantics of propositions. However, he also provides an interesting alternative to William of Ockham among medieval nominalists. His chief work was his Lectura super primum et secundum Sententiarum (Lectures on Books I and II of Peter Lombard's Sentences).

Born in Rimini in Italy, Gregory began studies in theology at Paris in 1323 and attained the rank of lector there in 1329. He then taught at Augustinian houses of study in Bologna, Padua and Perugia, before returning to Paris in 1341 or 1342 to prepare for his lectures on the *Sentences* of Peter Lombard as a baccalaureus from 1342-3 or 1343-4. Gregory returned to his native Rimini as regent of the Augustinian *studium* (house of studies) in 1351 and taught there until 1357. He replaced Thomas of Strasbourg as General Prior of the Augustinians in 1357, but died a year later.

Gregory's chief work was his *Lectura super primum et secundum Sententiarum (Lectures on Books I and II of Peter Lombard's Sentences)*. Through it he helped introduce to Paris many new English philosophers, including William of Ockham, Walter Chatton, Adam Wodeham, Richard Fitzralph and, to a lesser degree, Thomas Bradwardine, Richard Kilvington, William Heytesbury, Thomas Buckingham and Robert of Halifax. He had encountered the works of some of these authors during his many years of teaching in Italy, and of others during his preparatory year in Paris. Gregory's own doctrinal positions were carried back to the Augustinian house of studies at Oxford in the 1350s by John Klenkok. His philosophical works, *Tractatus de intensione et remissione formarum corporalium (Treatise on the Intension and Remission of Corporeal Forms)* and *De quattuor virtutibus cardinalium (On the Four Cardinal Virtues)* are complemented by a number of scriptural commentaries, theological treatises and his administrative records.

Although Gregory was portrayed by Joannes Aventinus (John Thurmayr) in 1517 as 'the standard-bearer of the nominalists', some historians have considered him to be a leader of the anti-nominalists and promoter of the condemnations touching John Mirecourt in 1347. To evaluate the tag of nominalism is a complex affair, especially in the fourteenth century, when it swelled from a denial of real entities corresponding to our universal concepts to include a dozen other points. The most recent editors of his *Lectura* label him 'a nominalistic alternative to William of Ockham'.

Gregory is known for his staunch allegiance to Augustine: he criticizes Peter Aureol in particular for imprecise Augustinian quotations and argues against Thomas Aquinas and for the intellectual knowledge of singulars by citing chapter after chapter of Augustine's *De libero arbitrio (On Free Choice)*. Experience plays a very strong role in Gregory's philosophy as it did in Augustine's, since there are many things that we experience both within and outside ourselves that we cannot deny even though we also cannot explain them in terms of universal scientific knowledge. The intellect, according to Gregory, knows singulars directly before it knows universals: 'a universal is not some thing outside the mind but is rather a concept created (*fictus*) or formed by the soul that is common to many things' (*Lectura*, I, 396). This *fictum* theory of the concept was defended earlier by Henry of Harclay and William of Ockham, but it was challenged by Walter Chatton and seemingly abandoned by Ockham in his later works.

Gregory argues against Ockham that the object of science cannot be identified as the conclusion of a demonstration. Yet he does not agree with Walter Chatton's claim that things outside the mind are the objects of science:

> since if this were the case, many sciences would be about contingent things that could be different than they are, whereas for strict science the object must be eternal and necessary. Every being, however, besides God is contingent and not necessary. If things outside the mind were the objects of the sciences, then many sciences, physical and geometrical, and many others, would be about things other than God, and therefore about contingent things.
>
> (*Lectura* I, 6)

Following the lead of Adam Wodeham, Gregory found a middle path between the positions of Ockham and

Chatton and located the eternal and necessary knowledge of science in the total over-all meaning or significate (the *complexe significabile*) of the conclusion of a syllogism. Thus, the total significate of the proposition 'God is eternal' is neither the proposition 'God is eternal', nor God, nor eternity, but the *dictum* (which might be expressed as God's-being-eternal). The total significate of 'God is eternal' or the state of affairs expressible as God's-being-eternal is the object of our scientific knowledge (see Logic, medieval; Wodeham, A.).

Gregory accepts with little alteration many claims of Ockham's natural philosophy. Gregory, like Ockham, employs a razor to establish that motion, time and sudden change are not distinct and definable entities in themselves. 'Sudden change', for example, does not signify some thing over and above the permanent things involved in the change, that is, over and above the subject which is changed and the form gained which the subject did not have previously, or the form lost which it previously had. Gregory stresses the contingency of the natural world. Since God is the only necessary being, all creatures and thus the whole created universe are contingent. The laws of nature have been freely chosen by God and have no absolute necessity of their own (see Natural philosophy, medieval).

If Gregory welcomes a great deal of Ockham's logic, scientific theory and physics, especially as adjusted by the latter's pupil, Adam Wodeham, his anthropology is quite critical of these Englishmen and he accuses both of being modern Pelagians in their appreciation of man (see Pelagianism). He stresses the weakness of fallen human nature both in our ability to know what we should choose and what we should shun and in our ability to carry out our will in the proper direction even if we had the right knowledge.

In his scientific methodology, in his interest in questions of logic and language and in his natural philosophy, Gregory brings a new form of Augustinianism to Paris and to the Augustinian Order elsewhere. The form of Augustinianism initiated in the late thirteenth century by Giles of Rome was not long-lasting and was without great difficulty replaced by Gregory's stronger, English-influenced approach to philosophical and theological questions.

Grice, Herbert Paul (1913-88)

Grice was a leading member of the post-war Oxford group of analytic philosophers. His small body of published work, together with an oral tradition, has been deeply influential among both philosophers and theoretical linguists. His outline of general rules of conversation began a new era in pragmatics. Grice's analysis of speaker's meaning explicates semantic notions in terms of the psychological concepts of intention and belief. His theory of conversation is based on the nature of language as a rational, cooperative activity. His account of conversational rules gave him a tool that he applied to a wide class of philosophical problems. Although Grice is most famous for his work on language and meaning, his interests cover a full range of philosophical topics, including ethics, moral psychology and philosophical psychology.

1 Life

Paul Grice was born on 15 March 1913 in Birmingham, England. A fellow and tutor at St John's College, Oxford, from 1938 to 1967, except when serving in naval intelligence during the Second World War, he was a member of a group of young Oxford philosophers who met under the leadership of J.L. Austin (see Austin, J.L. §2). He became Professor of Philosophy at the University of California at Berkeley in 1967, and died in Berkeley in 1988. Since he published reluctantly, much of his considerable influence came from the seminars and lectures he gave as a visitor to numerous universities and from his collaborative work. Grice was interested in a wide range of philosophical problems; more than most of his contemporaries of his rank he studied the great philosophers of the past, especially admiring Aristotle and Kant. He was exacting in presenting a problem, and lucid in exposing underlying issues and questions of methodology. Although his texts are often difficult to read, they are filled with wit, occasional irreverence and an exuberance which comes from his love of ideas.

Grice is most famous as a philosopher of language. His views on ethics, moral psychology and philosophical psychology, to some extent presented in public lectures, are mainly unpublished. The lectures, along with notebooks, are available in the Archives of the University of California.

2 Language and meaning

Meaning, Grice argued, does not result from conventions but is a function of what users do - with sounds and gestures as well as sentences and words. It is to be analysed in terms of intentions, on the part of an utterer, to produce a particular response in an audience. Utterer's meaning provides the basis for an analysis of utterance-type meaning, the meaning of words or sentences. The analysis explicates the stable truth-functional content of meaning - what, in Grice's terms, is 'said' by a speaker. But utterers may use language to mean more than what they say. Grice's theory of conversational implicature, propounded in 1967 in his William James lectures (1989), explains how this is possible (see Language, philosophy of).

3 Utterer's meaning

The meaning in general of a sign is to be explained in terms of what users of the sign mean by it on particular occasions. Grice's core idea is simple; the difficulties lie in the details. He begins by suggesting that '*x* meant something' would be true if *x* was intended by its utterer to induce a belief in some audience. To say what the belief was would be to say what *U* meant. But there is more to meaning that Jones is a murderer than acting so as to get someone to believe Jones to be a murderer: you could do that by leaving his handkerchief at the scene of the crime. Grice added nested intentions: you do something, meaning by it that *p*, if you do it intending to get someone to think that *p*, and intending to produce this result partly through the person's realizing that that is what you are up to ([1957] 1989). The idea seems obvious: meaning something by an utterance is distinguished from causing someone to believe something (or have some other propositional attitude) by the utterers' using their audience's *recognition* of their intention. The task of unpacking the idea is quite complex. The 'openness' of an utterer's intentions would later become an issue of considerable debate.

In his essay 'Utterer's Meaning and Intentions' ([1968] 1989), Grice proceeded to analyse utterer's meaning in two stages: (1) what it is for an individual to mean something; (2) what it is to mean that *p*. The interesting case, (2), is explained in terms of (1).

(1) ‘By uttering *x*, *U* meant something’ is true if and only if, for some audience *A*, *U* uttered *x* intending:
(i) *A* to produce some particular response *r*,
(ii) *A* to recognize that *U* intends (i), and
(iii) *A*s recognition that *U* intends (i) to function, in part, as a reason for (i).

To specify what *U* meant is to specify the nature of the intended response: where *x* is an indicative utterance, the response is *A*’s believing something, and where *x* is an imperative type the response is *A*’s intending to do something.

(2) ‘By uttering *x*, *U* meant that *p*’ is true if and only if for some audience *A*, *U* uttered *x* intending:
(i) *A* to believe that *p*,
(ii) and (iii) above.

This type of complex intention is called an ‘*M*-intention’. In a series of articles Grice revised this structure of nested intentions using more formal apparatus. He directed his attention to the meaning of imperative-type utterances, to a large range of speech-act types, and to meeting various counterexamples that he and others had proposed.

One series of issues concerns the ‘openness’ of meaning. A threatening infinity of intentions emerged in response to a case in which the three conditions for (2) - ‘By uttering *x*, *U* meant that *p*’ - are fulfilled. I do something (i) intending to get you to think that *p*, and (ii and iii) intending this to come about through your realizing that this is what I am up to, but *not* (iv) intending you to realize that (ii and iii) is what I am up to. For example, a man wants to ingratiate himself with his boss by letting him win at bridge. He does not wish to be blatant, but he does wish his boss, who likes such self-effacement, to know he wants him to win. To get this effect, he produces a smile when he has a good hand, intending this to be recognized as a simulation of a spontaneous response. Conditions i-iii of (2) are then fulfilled, but as Grice uses the idea of meaning, the employee did not mean by smiling that he had a good hand.

The problem, in the words of P.F. Strawson (1964), is that the employee’s intentions are not *wholly overt*; indeed, given that the employee does not wish to be crude, partial concealment is required. Utterer’s meaning requires openness; how is this to be conveyed in the analysans? Strawson proposed that Grice add a further condition, that the utterer *U* should utter *x* not only, as already provided, with the intention that *U* intends to obtain a certain response from *A*, but also with the intention that *A* should think that *U* has the intention just mentioned. This excludes the bridge-playing employee who wished his boss to take the smile as a spontaneous giveaway. With enough ingenuity, however, the same sort of counterexample can still be generated, and then a fifth clause will be needed, then a sixth, and so on.

Grice proposed to block an infinite regress by adding a condition which prevents ‘sneaky intentions’. Although there is continued debate about the extent of transparency required, as well as the form of its expression in the analysans, Grice himself felt that ‘the sneaky intention’ condition is *ad hoc*. Returning much later to the topic, he discussed what general conditions might legitimate our ‘deeming’ a speaker, given the absence of a sneaky intention, to have an infinity of intentions, and so to mean *p*. He worried about the legitimacy of ‘deeming’ someone to have an unrealizable intention.

The considerations which intrigued Grice, sketched in ‘Meaning Revisited’ ([1983] 1989) and in his ‘Reply to Richards’ (Grandy and Warner 1986), include his views on the nature of rational capacities, their connection to pre-rational states, and what he called value-oriented terms, that is, terms referring to a capacity or property such that attribution depends on proper or good specifications of that property. No completed account exists and much of the material is unfortunately unpublished. Some of his work on reasoning was however presented in the Locke/Kant lectures (1977, 1979).

4 Conversational implicature

Conversational implicature is not just a theory about language, but a tool to be applied to a wide class of philosophical problems. The theory simplifies semantics both by providing a single sense for the many uses of a word and by permitting a truth-functional analysis of ordinary language. Grice’s argument against the trenchant

criticisms of P.F. Strawson would return us, in some ways, to Bertrand Russell's conception of the relation between logic and language.

A person communicates more than what is said. Much of what is communicated is implied in one way or another. In the William James lectures Grice sketched the main types of implication, roughly characterized them, and proposed rules of conversation or communication which were specifications of a most general 'cooperative' principle. These rules govern a central class of implicatures, but they are not semantic in nature. They guide our conversations because they are rational, efficient ways to achieve common ends. Grice's work inaugurated a new era in what is now called pragmatics (see Pragmatics §§1, 3).

Grice's most general rule, the Cooperative Principle, requires that an individual's conversational contribution be such as is required, at the stage at which it occurs, by the accepted purpose or direction of the talk exchange. More specific maxims (and their submaxims) articulate this rule: they enjoin truthfulness, informativeness, relevance and clarity.

Speakers conversationally imply that which they must be assumed to think if we are to suppose them to observe the conversational maxims, or at least the Cooperative Principle. Conversational implicatures are brought within Grice's general account of meaning in terms of speaker's intentions by the further condition that it is known (and known to be known) by both audience and speaker that the audience is capable of working out the assumption required.

Grice illustrates how implicature works. One example, in which no maxim is violated, is of such a recognizably common nature that we can also see the pervasiveness of conversational implicatures. A man stands by an obviously immobilized car and says to an approaching stranger 'I am out of petrol'. The stranger replies, 'There is a garage around the corner'. He implies that he thinks the garage is open, has petrol to sell and so on, for otherwise the relevance maxim would be infringed.

Grice's most arresting examples concern speakers who deliberately flout a subordinate maxim while adhering to the overarching Cooperative Principle. These are used to show how tautologies and figures of speech can be meaningful. In general, speakers may flout a subordinate maxim in order to introduce into the exchange something they do not want to say explicitly. Here is one of Grice's examples: a tutor, writing a testimonial for a pupil who is a candidate for a philosophy job, says only that the candidate's command of English is excellent, and his attendance at tutorials regular. Given his knowledge of his pupil, the tutor must be wishing to impart information that he is reluctant to write down, namely that his pupil is no good at philosophy.

The William James lectures ([1967] 1989) display the sensitivity to nuances of ordinary language that made Grice such a notable practitioner of 'Ordinary Language' philosophy. He did think that what he called linguistic botanizing, as practised in that tradition, was essential. He also regarded himself as part of that philosophical tradition that wished to defend common sense. None the less, he criticized both the practices of common-sense philosophers and the lack of theoretical justification in much ordinary language philosophy. In his analysis of perception and when treating the logical stucture of ordinary English, Grice protested against those who would block a philosophical analysis whenever its key terms were used in ways that were out of line with common speech. Oddness was to be distinguished from the truth or falsity of an utterance. Grice used his general theory of conversational implicature to explain the oddness, and in this way defended the unfashionable causal theory of perception. Similarly, in discussing Strawson's thesis that certain expressions, such as 'not', 'and', 'or', 'if', 'all', 'some' and, famously, the definite description operator 'the', diverge in meaning from their counterparts in formal logic, Grice held that both the advocates of truth-functional analyses and their opponents fail to attend to the conditions governing conversation (see Ordinary language philosophy, school of §3).

5 Value

Grice's views on value are subtle. Value is constructed by us, but objective. His lectures, 'The Conception of Value' ([1983] 1991) attempt to provide a metaphysical basis for value. Grice depicts an Aristotelian world in which objects and creatures are characterized in terms of what they are supposed to do, thus enabling us to evaluate by reference to function and finality. But he argues that the legitimacy of these evaluative judgments rests on an argument for absolute value. He makes the same claim for explanations in terms of purposiveness. Vitalistic phenomena can also be explained by mechanistic, cybernetic notions; these threaten the irreducibility of finality

features unless there is a domain of objects in which attribution of finality has no substitute. Rational beings, or persons, are said to furnish such a domain.

Grice's attempt to secure our evaluations takes as its first task understanding the concept of value, whose hybrid nature - describing and motivating - needs to be made intelligible. He begins by utilizing a device called 'Humean Projection'. Hume attributed to the mind a tendency 'to spread itself upon objects'; values start off as human attitudes, features of our minds or psychological states, but are projected onto the world. Motivation comes via our own attitudes, description from their projection. What served Hume as a diagnosis of one source of illusion becomes, under conditions Grice carefully specified, a legitimating procedure.

Humean projection was first used in an address, 'Method in Philosophical Psychology (from the Banal to the Bizarre)' ([1975] 1991), to justify the attribution to creatures of concepts which were unavailable to their predecessors. It offers a partial explanation of what it is to be a more developed psychological creature, by describing greater internalization or representational capacity in a creature. Internalized expressions include connectives, quantifiers, temporal modifiers, mood indicators, modal operators and names of psychological states, such as 'judge' and 'will'. The specific benefit of the procedure when applied to value is that judgments of value are not translatable back into preferences or imperatives or any other approving or volitional attitudes from which they are being constructed. Non-translatability does not, however, guarantee objectivity for value judgments. Grice thought that objectivity required the provision of 'something like' truth conditions for their expression. The lectures on value present a story, which Grice intended as the analogue of truth-conditions.

Objective value is attributed to the end-products of Humean projection if those who do the projecting are themselves of absolute value and can thus 'transmit' it - an adaptation of Aristotle's 'what seems good to the good man *is* good'. Two moves are thought to legitimate this attribution of value. First, Grice argues for the propriety of conceiving of human beings as persons. He introduces an operation flauntingly named Metaphysical Transubstantiation, a procedure for the redistribution but not the invention of properties. What was accidental becomes essential, and rationality, which attaches only accidentally to humans, becomes, via this construction routine, an essential property of persons. As persons, Grice claims, we will have a 'rational demand for absolute value'. Grice's second move is to invoke a 'metaphysical principle of supply and demand' which allows us to believe what can in a 'trouble-free' manner satisfy a rational demand. Despite his persuasive defence of these ideas, Grice recognized that, rather than offering a systematic account, he was sketching a story of value 'bristling with problems'.

Grosseteste, Robert (*c.*1170-1253)

Grosseteste's thought is representative of the conflicting currents in the intellectual climate of Europe in the late twelfth and early thirteenth centuries. On the one hand, his commitment to acquiring, understanding and making accessible to his Latin contemporaries the texts and ideas of newly discovered Arabic and Greek intellectual traditions places him in the vanguard of a sweeping movement transforming European thought during his lifetime. His work in science and natural philosophy, for example, is inspired by material newly translated from Arabic sources and by the new Aristotelian natural philosophy, especially the Physics, On the Heavens and Posterior Analytics (Aristotle's treatise on the nature of scientific knowledge). Similarly, in his work in metaphysics, ethics and theology Grosseteste turns to ancient sources previously unknown (or incompletely known) to Western thinkers, prominent among which are Aristotle's Ethics and the writings of Pseudo-Dionysius. His work as a translator of and commentator on Aristotle and Pseudo-Dionysius places Grosseteste among the pioneers in the assimilation of these important strands of the Greek intellectual heritage into the mainstream of European thought.

On the other hand, Grosseteste's views are in significant respects conservative. His greatest debt is to Augustine, and his most original ideas - such as his view that light is a fundamental constituent of all corporeal reality - are extensions of recognizably Augustinian themes. Moreover, although his work on Aristotle is groundbreaking, his approach is judicious and measured, lacking any hint of the crusader's zeal that marks the work of the later radical Aristotelians. In general his practice conforms to the traditional Neoplatonist line, viewing Aristotle as a guide to logic and natural philosophy while turning to Platonism - in Grosseteste's case, Augustinian and Pseudo-Dionysian Platonism - for the correct account of the loftier matters of metaphysics and theology.

1 Life and works

Grosseteste was born probably shortly before 1170 in Suffolk, England. There is little evidence of his activities until the mid-1220s, when he would have been already well over fifty years old. In 1225 he was lecturing in theology at Oxford, where he also served for a time as chancellor of the university. In 1230 he left his post in Oxford's secular schools to become the first lecturer at the newly established house of studies for the Oxford Franciscans. He remained there until 1235 when he was elected bishop of Lincoln, England's largest diocese, which then included Oxford. He served in that position until his death in 1253.

We know little about Grosseteste's formal training or career prior to his appearance at Oxford in 1225. He may have begun his studies at Oxford or Cambridge in the 1180s, receiving the degree of Master of Arts by the end of that decade. He seems to have had an administrative career in the household of the Bishop of Hereford until perhaps 1198. It may have been in Hereford, an early centre of interest in scientific speculation, that Grosseteste developed his deep interests in natural philosophy, astronomy and mathematics. His earliest works, dating from about 1200-20, deal with subject matter of this sort: they include *De cometis (On Comets)*, *De artibus liberalibus (On the Liberal Arts)*, *De generatione sonorum (On the Generation of Sounds)*, *De sphaera (On the Sphere)* and *De impressionibus aeris (On the Influences of Air)*. Shortly after 1220 Grosseteste seems to have begun serious reflection on Aristotle. His *Commentarius in Posteriorum analyticorum libros (Commentary on Aristotle's Posterior Analytics)*, perhaps the first complete medieval commentary on that text, probably dates to the early 1220s. The earliest of his notes on Aristotle's *Physics* (which have been gathered together as the *Commentarius in VIII libros Physicorum*) may date from the same period. It is unclear whether Grosseteste ever studied at Paris or whether he spent time in Paris during the suspension of studies at Oxford in 1209-14, as many English academics did.

During the 1220s at Oxford, the study and teaching of theology moved to the center of Grosseteste's attention. As part of his study of the Bible and the Church Fathers, Grosseteste began learning Greek, an undertaking that would yield remarkable fruit in his late-blooming career as a philosophical theologian. The writings in philosophical theology that belong to the period from 1225-30 include *De veritate (On Truth)*, *De veritate propositionis (On the Truth of the Proposition)*, *De libero arbitrio (On Free Choice)* in two recensions, *De scientia Dei (On God's Knowledge) De statu causarum (On the Finitude of Causal Series)*, *De intelligentiis (On Intelligences)* and *De unica forma (On the Single Form)*.

Grosseteste's growing theological occupations did not displace his work in natural philosophy, however, and in the period from 1225 to about 1240 he continued to write on natural philosophy, weaving together his scientific and mathematical interests with his theological work. He continued to lecture on Aristotle's *Physics* into the early 1230s, and composed his treatise on the six days of creation, *Hexaemeron*, in 1230-5 as well as several treatises on broadly scientific matters, including *De impressionibus elementorum (On the Influences of the Elements)*, *De motu supercaelestium (On the Motion of What is Above the Heavens)*, *De motu corporali et luce (On Corporeal Motion and Light)*, *De lineis (On Lines)*, *De natura locorum (On the Nature of Places)*, *De iride (On the Rainbow)*, *De colore (On Colour)*, *De calore solis (On the Heat of the Sun)*, *De operationibus solis (On the Activities of the Sun, an exposition of Ecclesiasticus 43: 1-5)*, *De finitate motus et temporis (On the Finitude of Motion and Time)* and *De differentiis localibus (On the Differentiae Associated with Place)*. Central to Grosseteste's scientific reflections in this period is his developing account of the nature of light and its fundamental role in both natural and divine causality. That account reaches its fullest development in *De luce (On Light)*.

The crowning scholarly achievements from the years in which Grosseteste was Bishop of Lincoln result from monumental projects involving translation of and commentary on Greek philosophical and theological texts. In the mid-1230s he revised a twelfth-century translation of John Damascene's *De fide orthodoxa (On the Orthodox Faith)* (see John of Damascus) and produced the first Latin translations of the remainder of Damascene's corpus, *De logica (On Logic)*, *De centum heresibus (On the Hundred Heresies)*, *Elementarium dogmatum (Introduction to Doctrine)* and *De hymno Trisagion (On the Hymn 'Holy, Holy, Holy')*. Shortly thereafter he began the largest of his scholarly endeavours, the production of translations of and commentaries on each of Pseudo-Dionysius's four major treatises: *De caelesti hierarchia (On the Celestial Hierarchy)*, *De ecclesiastica hierarchica (On the Ecclesiastical Hierarchy)*, *De divinis nominibus (On the Divine Names)* and *De mystica theologia (On Mystical Theology)* (see Pseudo-Dionysius). By 1243 this massive undertaking was complete, and Grosseteste turned next to Aristotle's *Ethics* (see Aristotle). By the late 1240s he had finished the first Latin translation of the complete text of the *Ethics*. To accompany his translation Grosseteste produced translations of the ancient Greek commentators on the *Ethics* and his own glosses on the text. Apparently in the last years of his life, at close to eighty years of age, Grosseteste began studying Hebrew.

2 Augustinian psychology and epistemology

Following Augustine, Grosseteste appeals to the nature and behaviour of light to explain the fundamental nature of reality and human cognition of it. God is the first and highest light, and all creatures depend on God in the way rays of light depend on the light source from which they radiate. The eternal ideas in God act as principles in creation (*creatrices*) insofar as they are the formal exemplar causes of created things. Creatures have their being, and hence are 'true' (in the sense of 'true friend') to the extent to which they conform or are 'adequated' to the eternal ideas.

Grosseteste holds that since the eternal ideas in God are the exemplars of created things, knowledge of creatures depends on illumination from God:

> Since the truth of each thing is its conformity to the idea of it in the eternal Word, it is clear that every created truth is seen only in the light of the highest truth.…All created truth, therefore, is clear insofar as the light of its eternal idea is present to the observer, as Augustine testifies. Nor can anything be seen to be true in its created truth alone, just as a body cannot be seen to be coloured solely in its colour apart from the illumination of an extrinsic light.
>
> (*De veritate*)

Grosseteste believes that our cognitive dependence on God's illumination is a function of our weakness. Just as the weak eyes of the body cannot look at the sun itself, despite their depending on sunlight for seeing coloured bodies, the weak eyes of the mind cannot look on the highest truth itself, though the mind depends for its vision of truth on the light streaming from it. By contrast, pure intellects - the divine intellect, the separate intelligences and purified human intellects (in heaven) - have knowledge by virtue of their direct awareness of the eternal ideas and of the highest light itself (*De veritate*; *Commentarius in Posteriorum analyticorum libros* I.7, I.14).

In Grosseteste's view, our cognitive weakness is explained in part by the soul's embodiment:

> If the highest part of the human soul - the so-called intellective part which is not the actuality of any body and

> needs no corporeal instrument for its proper activity - were not clouded and weighed down by the weight of the corrupt body, it would have complete knowledge without the aid of sense-perception through an irradiation received from a higher light, just as it will have when the soul has cast aside the body.… But because the purity of the eye of the soul is clouded and weighed down by the weight of the body, all the powers of the rational soul are oppressed from birth by the weight of the body so that they cannot act, and so are in a certain way drowsy.
>
> (*Commentarius in Posteriorum analyticorum libros* I.14)

Our embodiment also accounts for the indispensable role sense-perception plays in our acquisition of knowledge: ‘In the course of time, as sense-perception acts through its many encounters with sensible things, reason (which is intermingled with the senses and is, as it were, ferried to sensible things by the senses as in a boat) is awakened’ (*Commentarius in Posteriorum analyticorum libros* I.14). Once awakened, reason begins to function, drawing distinctions and abstracting until it arrives at cognition first of universals, then of necessary truths and finally of the sorts of demonstrations that provide the strictest kind of knowledge.

Human cognitive weakness results not only from the soul’s embodiment but also from the soul’s misdirected love:

> The cause of the soul’s sight’s being clouded through the weight of the corrupt body is that the soul’s affection and vision (*affectus et aspectus*) are not distinct, and it attains its vision only by that by which it attains its affection or its love. Therefore since the soul’s love and affection are directed toward the body and bodily enticements, it necessarily drags the soul’s vision behind it and directs it away from its light.
>
> (*Commentarius in Posteriorum analyticorum libros* I.14)

In our present state, turned away from the light, we must make our way toward truth starting from vestiges of light discovered in the external senses; but to the extent that our love is directed away from corruptible things, our cognitive gaze will be directed toward its own light until, purified of bodily distractions, it will look on the light itself.

3 Light as the first corporeal form

Some of Grosseteste’s most original ideas result from his extension of the Augustinian metaphor of illumination to issues in natural philosophy. He is captivated by a particular characteristic of light, namely, its essential ability to multiply and diffuse itself instantaneously (as he thought) in all directions. He saw in this feature the mechanism of an ambitious account of the generation of the physical universe (see Illumination).

The problem, as Grosseteste sees it, is to account for the three-dimensional extension of bodies and of the corporeal universe in general. This is because the ultimate principles of corporeal things are prime matter and bodily form, each of which is in itself simple and utterly dimensionless. Prime matter must be dimensionless because its possessing dimensions would entail its being informed in some way; and bodily form, considered just as form, must be wholly immaterial and cannot therefore be spatially extended. Hence the combination of simple, unformed matter with simple form cannot give rise to quantitative extension. Moreover, no finite multiplication of a simple form in matter can give rise to quantitative extension because no aggregation of a finite number of extensionless entities can constitute anything extended. Grosseteste’s solution to this problem is to identify light with the primary corporeal form:

> I judge that the first corporeal form, which some call corporeity, is light. For light, of itself, diffuses itself in every direction so that from a point of light, a sphere of light as great as you please is generated instantaneously.… But corporeity is that from which the extension of matter into three dimensions necessarily follows.… But it was impossible for form, which in itself is simple and dimensionless, to introduce dimensions into matter in every direction - since matter is likewise simple and dimensionless - except by multiplying and diffusing itself instantaneously in every direction and by extending matter, in its diffusion. For form itself could not leave matter behind, since it is not separable.
>
> (*De luce*)

In its instantaneous infinite multiplication light, as it were, stretches the matter it informs into a three-dimensional quantity. Grosseteste holds that this generation of extended matter occurs instantaneously at the beginning of time

when God creates the first corporeal form in prime matter, which God also creates simultaneously. Moreover, he holds that since the infinite multiplication of something simple yields something finite (because what is produced by the infinite multiplication of something infinitely exceeds that by the multiplication of which it was produced), light's instantaneous infinite multiplication of itself yields finite corporeal extension in every direction. The full extent of that finite extension defines a sphere coextensive with the whole of the corporeal universe (*machina mundi*).

Grosseteste's reflections on the generation of the corporeal universe lead him to two particularly interesting corollaries. First, he reasons that if in general the infinite multiplication of something simple is required to produce a thing of finite quantity, then it must be that there are infinities of different magnitudes, the difference in the magnitude of the infinities accounting for the quantitative difference in objects of different sizes:

> Now, it is possible that an infinite aggregation of numbers is related to another infinite aggregation in any numeric ratio (and even in any non-numeric ratio), and [so] there are infinities that have more [elements] than other infinities and infinities that have fewer than others. (The aggregation of all the numbers, both even and odd, is infinite, and it is thus greater than the aggregation of all the even numbers, which is nevertheless infinite.) …It is clear therefore that by its infinite multiplication, light extends matter into smaller finite dimensions and into larger finite dimensions in any ratio whatever.

(*De luce*)

Thus, the first corporeal form - light - explains not only how there can be a three-dimensional corporeal world but also how there can be bodies in it of different sizes.

Second, Grosseteste supposes that since light is the first corporeal form and as such is intrinsic and fundamental to all corporeal reality, understanding the behaviour of light is fundamental to understanding all natural phenomena. Mathematics, therefore, and in particular geometry and optics (the science of refraction), are indispensable tools for natural philosophy: 'The consideration of lines, angles, and figures is especially useful since it is impossible to have knowledge of natural philosophy without them' (*De lineis*). Grosseteste's lifelong commitment to these disciplines provides the foundation for an enduring tradition of mathematical and scientific speculation at Oxford in the later Middle Ages (see Natural philosophy, medieval; Oxford calculators).

List of works

Grosseteste, R. (*c*.1170-1253) *Opera Roberti Grosseteste Lincolniensis*, ed. J. McEvoy, Corpus Christianorum Continuatio Medievalis, Turnhout: Brepols.(A number of volumes are projected, including volumes devoted to Grosseteste's work on the Pseudo-Dionysian corpus. To date, only the first volume has appeared, containing Grosseteste's Pauline commentaries and his *Tabula*.)

Grosseteste, R. (*c*.1200) *De cometis (On Comets)*, ed. S. Thomson, 'The Text of Grosseteste's *De cometis*', *Isis* 19, 1933: 19-25.

Grosseteste, R. (1200-10) *De artibus liberalibus (On the Liberal Arts)*, ed. L. Baur in *Die Philosophischen Werke des Robert Grosseteste*, Münster: Aschendorff, 1912, 1-7.

Grosseteste, R. (1200-10) *De generatione sonorum (On the Generation of Sounds)*, ed. L. Baur in *Die Philosophischen Werke des Robert Grosseteste*, Münster: Aschendorff, 1912, 7-10.

Grosseteste, R. (*c*.1215) *De sphaera (On the Sphere)*, ed. L. Baur in *Die Philosophischen Werke des Robert Grosseteste*, Münster: Aschendorff, 1912, 10-32.

Grosseteste, R. (1215-20) *De impressionibus aeris (On Atmospheric Pressures)*, ed. L. Baur in *Die Philosophischen Werke des Robert Grosseteste*, Münster: Aschendorff, 1912, 41-51.

Grosseteste, R. (1220-32) *Commentarius in VIII libros Physicorum Aristotelis (Commentary on Aristotle's Physics)*, ed. R. Dales, Boulder, CO: University of Colorado Press, 1963.

Grosseteste, R. (early 1220s) *Commentarius in Posteriorum analyticorum libros (Commentary on Aristotle's Posterior Analytics)*, ed. P. Rossi, Florence: Olschki, 1981.(Translation by S. Macdonald, *Commentary on the Posterior Analytics*, New Haven, CT: Yale University Press, forthcoming.)

Grosseteste, R. (1225-30) *De veritate (On Truth)*, ed. L. Baur in *Die Philosophischen Werke des Robert*

Grosseteste, Münster: Aschendorff, 1912, 130-43; trans. R. McKeon in *Selections from Medieval Philosophers*, New York: Charles Scribner's Sons, 1929, vol. 1, 263-81.

Grosseteste, R. (1225-30) *De veritate propositionis (On the Truth of a Proposition)*, ed. L. Baur in *Die Philosophischen Werke des Robert Grosseteste*, Münster: Aschendorff, 1912, 143-5; trans. R. McKeon in *Selections from Medieval Philosophers*, New York: Charles Scribner's Sons, 1929, vol. 1, 282-4; trans. N. Lewis in 'Time and Modality in Robert Grosseteste', Ph.D. dissertation, University of Pittsburgh, 1988, 427-9. (Lewis' dissertation also contains a corrected version of Baur's edition on pages 380-4.)

Grosseteste, R. (1225-30) *De libero arbitrio (On Free Will)*, ed. N. Lewis, 'The First Recension of Robert Grosseteste's "De libero arbitrio"', *Mediaeval Studies* 53, 1991: 1-88; trans. N. Lewis in 'Time and Modality in Robert Grosseteste', Ph.D. dissertation, University of Pittsburgh, 1988, 391-424.

Grosseteste, R. (1225-30) *De scientia Dei (On the Knowledge of God)*, ed. L. Baur in *Die Philosophischen Werke des Robert Grosseteste*, Münster: Aschendorff, 1912, 145-7; trans. R. McKeon in *Selections from Medieval Philosophers*, New York: Charles Scribner's Sons, 1929, vol. 1, 285-7; trans. N. Lewis in 'Time and Modality in Robert Grosseteste', Ph.D. dissertation, University of Pittsburgh, 1988, 425-6.(Lewis' dissertation also contains a corrected version of Baur's edition on pages 377-9.)

Grosseteste, R. (1225-30) *De statu causarum (On the State of Causes)*, ed. L. Baur in *Die Philosophischen Werke des Robert Grosseteste*, Münster: Aschendorff, 1912, 120-6.

Grosseteste, R. (1225-30) *De intelligentiis (On Intelligence)*, ed. L. Baur in *Die Philosophischen Werke des Robert Grosseteste*, Münster: Aschendorff, 1912, 112-20. (This treatise is the second part of a single letter composed by Grosseteste; *De unica forma* is the first part.)

Grosseteste, R. (1225-30) *De unica forma (On the Unity of Forms)*, ed. L. Baur in *Die Philosophischen Werke des Robert Grosseteste*, Münster: Aschendorff, 1912, 106-12.(This treatise is the first part of a single letter composed by Grosseteste; *De intelligentiis* is the first part.)

Grosseteste, R. (1230-5) *Hexaemeron*, ed. R. Dales and S. Gieben, London: Oxford University Press, 1982; trans. C. Martin, *Robert Grosseteste: On the Six Days of Creation*, London: Oxford University Press, 1996.

Grosseteste, R. (1230-5) *De impressionibus elementorum (The Impressions of the Elements)*, ed. L. Baur in *Die Philosophischen Werke des Robert Grosseteste*, Münster: Aschendorff, 1912, 87-90.

(1230-5) *De motu supercaelestium (On the Motion of What is Above the Heavens)*, ed. L. Baur in *Die Philosophischen Werke des Robert Grosseteste*, Münster: Aschendorff, 1912, 92-101.

Grosseteste, R. (1230-5) *De motu corporali et luce (On Corporeal Motion and Light)*, ed. L. Baur in *Die Philosophischen Werke des Robert Grosseteste*, Münster: Aschendorff, 1912, 90-2.

Grosseteste, R. (1230-5) *De lineis (On Lines)*, ed. L. Baur in *Die Philosophischen Werke des Robert Grosseteste*, Münster: Aschendorff, 1912, 59-65.(This treatise and *De natura locorum* are two parts of a single treatise.)

Grosseteste, R. (1230-5) *De natura locorum (On the Nature of Places)*, ed. L. Baur in *Die Philosophischen Werke des Robert Grosseteste*, Münster: Aschendorff, 1912, 65-72.(This treatise and *De lineis* are two parts of a single treatise.)

Grosseteste, R. (1230-5) *De iride (On the Rainbow)*, ed. L. Baur in *Die Philosophischen Werke des Robert Grosseteste*, Münster: Aschendorff, 1912, 72-8.

Grosseteste, R. (1230-5) *De colore (On Colour)*, ed. L. Baur in *Die Philosophischen Werke des Robert Grosseteste*, Münster: Aschendorff, 1912, 78-9.

Grosseteste, R. (1230-5) *De calore solis (On the Heat of the Sun)*, ed. L. Baur in *Die Philosophischen Werke des Robert Grosseteste*, Münster: Aschendorff, 1912, 79-84; trans. A.C. Crombie in D.A. Callus (ed.) *Robert Grosseteste: Scholar and Bishop*, Oxford: Clarendon Press, 1955.

Grosseteste, R. (1230-5) *De operationibus solis (On the Activities of the Sun)*, ed. J. McEvoy, 'The Sun as "Res" and "Signum": Grosseteste's Commentary on Ecclesiasticus ch. 43, vv. 1-5', *Recherches de théologie ancienne et médiévale* 41, 1974: 38-91.

Grosseteste, R. (1230-5) *De finitate motus et temporis (On the Finitude of Motion and Time)*, ed. R. Dales, 'Robert Grosseteste's Treatise "De finitate motus et temporis"', *Traditio* 19, 1963: 245-66.

Grosseteste, R. (1230-5) *De differentiis localibus (On the Differentiae Associated with Place)*, ed. L. Baur in *Die Philosophischen Werke des Robert Grosseteste*, Münster: Aschendorff, 1912, 84-7.

Grosseteste, R. (1235-40) *De luce (On Light)*, ed. L. Baur in *Die Philosophischen Werke des Robert Grosseteste*, Münster: Aschendorff, 1912, 51-9; trans. C. Riedl, *Robert Grosseteste on Light*, Milwaukee, WI: Marquette University Press, 1942.

Grosseteste, R. (1238-43) *Notulae in De caelesti hierarchia (Glosses on Pseudo-Dionysius' On the Celestial Hierarchy)*, chs 1-9 ed. and trans. J. McQuade in 'Robert Grosseteste's Commentary on the "Celestial Hierarchy" of Pseudo-Dionysius the Areopagite', Ph.D. dissertation, Queen's University of Belfast, 1961; chs

10-15 ed. and trans. J. McEvoy, ‘Robert Grosseteste on the *Celestial Hierarchy* of Pseudo-Dionysius’, MA dissertation, Queen’s University of Belfast, 1967. (These two editions are scheduled to appear in *Opera Roberti Grosseteste Lincolniensis.*)

Grosseteste, R. (1238-43) *Notulae in De ecclesiastica hierarchia (Glosses on Pseudo-Dionysius’ On the Ecclesiastical Hierarchy)*, ed. C. Taylor Hogan, ‘Robert Grosseteste, Pseudo-Dionysius, and Hierarchy: A Medieval Trinity’, Ph.D. dissertation, Cornell University, 1991.(Editions of Grosseteste’s work on the Pseudo-Dionysian corpus are scheduled to appear in *Opera Roberti Grosseteste Lincolniensis*.)

Grosseteste, R. (1238-43) *Notulae in De divinis nominibus (Glosses on Pseudo-Dionysius’ On the Divine Names)*, chs 1 and 4 ed. F. Ruello, ‘La *Divinum Nominim Reseratio* selon Robert Grosseteste et Albert le Grand’, *Archives d’histoire doctrinale et littéraire du moyen âge* 34, 1959: 99-197.(Editions of Grosseteste’s work on the Pseudo-Dionysian corpus are scheduled to appear in *Opera Roberti Grosseteste Lincolniensis*.)

Grosseteste, R. (1238-43) *Notulae in De mystica theologia (Glosses on Pseudo-Dionysius’ On Mystical Theology)*, ed. U. Gamba, *Il Commento di Roberto Grossatesta al ‘De Mystica Theologia’ del Pseudo-Dionigi Areopagita*, Milan, 1942.(Editions of Grosseteste’s work on the Pseudo-Dionysian corpus are scheduled to appear in *Opera Roberti Grosseteste Lincolniensis*.)

Grosseteste, R. (1240-7) *Notulae in Ethicam Nicomacheam (Glosses on Aristotle’s Nicomachean Ethics)*, ed. H. Merken, *The Greek Commentaries on the Nicomachean Ethics of Aristotle in the Latin Translation of Robert Grosseteste*, Leiden: Brill, 1973-, 5 vols.(Vol. I containing Grosseteste’s translations of the Greek commentators on Books I-IV of the *Ethics* appeared in 1973; vol. III containing the translations of the Greek commentators on Books VII-X appeared in 1991; vol. II containing the translation of the commentators on Books V-VI, vol. IV containing indices for vols 1-III, and vol. V containing an edition of Grosseteste’s glosses have not to date been published.)

Grote, John (1813-66)

From 1855 Grote was Knightbridge Professor at Cambridge. His literary legacy was largely posthumous. Often seen as unsystematic, he was in fact a penetrating thinker who forcefully criticized utilitarianism and positivism and ably argued that 'all that we call existence is for us a thought *of ours'; his was a seminal British idealism, stressing both the gulf between philosophical inquiry and the sciences and the difficulty of distinguishing the necessary from the contingent.*

Grote's views derived from Plato, Aristotle, Cicero, Christianity, Kant and the Cambridge Moralists. *An Examination of the Utilitarian Philosophy* exposes the gap between J.S. Mill's abstract utilitarian principle and concrete guidance, and shows how Mill failed to justify utilitarian benevolence over egoism or the demands of special relations - 'family, order, class, friends, country' (see Mill, J.S.). Though the ideal of happiness needs an intuitive ground, utilitarianism is partly right. What it misses is the more basic viewpoint of human agency: what we ought to do. Virtue and duty, requiring benevolent and distributivist action, are distinct demands, better addressing the basic ethical question: 'How different is moralized human nature to be from human nature unmoralized and as it is a subject of simple observation?' *A Treatise on the Moral Ideals* develops this system of 'Eudaemonics and Aretaics'; the former engages our sentient nature, that pain is undesirable to suffer, the latter our active nature, that pain ought not to be inflicted, though their common source is the claim that existence is driven by 'want' - a want to be, know, do and realize ideals. Positivism and utilitarianism miss the ideality or 'aspiringness' of thought, or how imagination constitutes our world. Ultimately, Eudaemonics is subordinate to Aretaics, which includes Deontics, and is differentiable into a plurality of other ideals with independent value - for example, justice, generosity, perfection, courage. The theistic faith that all these ideals cohere in an orderly universe is one 'we instinctively and intuitively have'.

Exploratio Philosophica develops Grote's original epistemology, critically engaging J.F. Ferrier but intricately demolishing a host of others for not keeping philosophical inquiry into truth separate from scientific inquiry into causes. For Grote, knowledge involves both propositions and judgments about what is 'given' immediately in experience, and progresses by 'distinction, not aggregation', discerning parts of a 'previously conceived whole'. He introduces the distinction between knowledge by acquaintance and by description, but for him, immediacy and reflection are continuous, complementary aspects of experience, whereby mind, via philosophy, traces itself in the order and purpose there. It is a basic truth that 'we know' and are free; we 'cannot superadd the idea of knowledge to that of existence and *then* analyse the knowledge' without disintegrating the idea of existence presupposed, just as the 'idea of freedom or choice of action will not superadd itself to that of a state of things independent of it, without pulling this latter to pieces'. Moreover, as 'one word of a language implies the whole system of it, so does one particular of knowledge involve thought of the, as yet unparticularized, universe'. 'On Glossology' (1872, 1874) also seeks the origins of knowledge in language, as speech, looking not to etymology but to what we 'wish to express, by the words' and 'what the person whom we address will understand by them'.

J.B. Mayor rightly noted not only Grote's 'freshness of thought', but also his 'fearlessness in the use of neologisms' - notably 'personalism', 'hedonics', and 'relativism'. Yet, however knotty his style, Grote foreshadowed much that was to come in idealistic, analytic and linguistic philosophy.

BART SCHULTZ

List of works

The following list is limited to Grote's philosophical works, and does not include various other works. The best archival source is the Grote/Mayor Papers in the Wren Library, Trinity College, Cambridge.

Grote, J. (1865) *Exploratio Philosophica, Part I*, Cambridge: Deighton, Bell. (Published under his supervision, this work gives the substance of Grote's own idealist epistemology and ontology, which are elaborated through a conversational engagement with the work of such contemporaries as Ferrier, Whewell, Hamilton and J.S. Mill.)

Grote, J. (1867) ‘What is Materialism?’, *Macmillan’s Magazine* 15: 371-81.(Forming chapters 1-3 of *Exploratio Philosophica*, *Part II*, this work criticizes the development of psychology by a comparative analysis of the logical coherence of materialist physiology, associational psychology, philosophical epistemology and idealism.)

Grote, J. (1870) *An Examination of the Utilitarian Philosophy*, ed. J.B. Mayor, Cambridge: Deighton, Bell.(A brilliant assessment of utilitarianism, arguing that J.S. Mill’s revision of the doctrine is at odds with the earlier tradition and incoherent in itself.)

Grote, J. (1871) ’Thought versus Learning’, *Good Words* 12: 818-23.(Argues that the best strategy in adult education is to encourage thinking via engagement in conversation, rather than to impose learning via the digestion of books.)

Grote, J. (1871) ’On a Future State’, *Contemporary Review* 18: 133-40.(Attacks the appeal to supposed knowledge of the afterlife and the threat of damnation as a means of inculcating religious observance.)

Grote, J. (1872) ‘On Glossology’, *Journal of Philology* 4: 55-66, 157-81; also in *Journal of Philology* 1874 (5): 153-82.(Grote’s linguistic prolegomena to philosophy and ethics, which in opposition to the philologists argues that the meaning of words is best established by the study of everyday usage.)

Grote, J. (1876) *A Treatise on the Moral Ideals*,ed. J.B. Mayor, Cambridge: Deighton, Bell.(Being the positive statement of Grote’s moral philosophy, this text unites what is valid in both consequentialism and deontology in the systems of Eudaemonics and Aretaics, and grounds both of these in the experience of ‘want’ while also elaborating the plurality of moral ideals.)

Grote, J. (1877) ’Pascal and Montaigne’, *Contemporary Review* 30: 285-96.(A careful comparison of Pascal and Montaigne on the human condition.)

Grote, J. and Sidgwick, H. Grotius, Hugo (1583-1645)

Scholar, lawyer and statesman, Grotius contributed to a number of different disciplines. His reputation as the founder both of a new international order and of a new moral science rests largely on his De iure belli ac pacis (The Law of War and Peace) (1625). Though the tendency today is to regard Grotius as one figure among others in the development of the concept of international law, he is increasingly regarded as one of the most original moral philosophers of the seventeenth century, in particular as having laid the foundations for the post-sceptical doctrine of natural law that flourished during the Enlightenment.

Of several striking epithets applied to Grotius, the earliest was that of Henry IV, who called him ‘the miracle of Holland’. When only 15 years old Grotius had been taken on a diplomatic mission from the United Provinces to France, where he astonished the King with his prodigious learning. As a classicist, poet, historian, theologian and jurist he continued to impress his contemporaries throughout his life. He also continued to participate in international diplomacy during a period of almost constant conflict. For some twenty years he served the United Provinces until, on the fall of his patron Jan van Oldenbarnevelt in 1619, he was imprisoned for life. After a dramatic escape two years later he once again left The Netherlands for France, this time permanently. From 1634 until his death he acted as ambassador to France for Queen Christina of Sweden.

His interest in international relations earned Grotius another remarkable epithet, ‘the father of international law’. As early as 1605 he wrote a treatise in defence of Dutch incursions in the East Indies, of which one chapter was published as *Mare liberum* (The Freedom of the Seas) in 1609. The treatise as a whole did not appear in print until 1864 as *De iure praedae* (The Law of Plunder), but in 1625 Grotius provided a fuller and somewhat revised statement of his ideas in the work on which his reputation chiefly rests, *De iure belli ac pacis*. In the first of its three books Grotius examined the notion of a just war, before moving on in the second to review the causes of just wars and in the third to consider how wars were justly waged.

The *De iure belli* did much to promote the idea of a society of states bound together by the common recognition of a set of rules governing relations between them. None the less, Grotius’ reputation as the founder of an international legal order has not survived intact, partly because he wrote on only some aspects of international law, partly because his views were largely derivative. By contrast, his reputation as the founder of a new moral science has been rehabilitated. Although he wrote in the apparently familiar language of the natural law tradition, Grotius is believed to have established a new basis for ethical inquiry by tracing everything back to the one tenet of natural law that even sceptics would not deny, the idea that men were entitled to preserve themselves. From this foundation he - and to a greater degree his successors - reconstructed an elaborate body of natural law doctrine on a mathematical model (see Natural law §§4-5).

Guanzi

The Guanzi, or 'Book of Master Guan', is an eclectic work including textual materials dating from the fourth century BC to the first century AD, drawing on themes from Daoism, the science of government, yin-yang *and the Five Phases, Legalism, Confucianism, the art of war, economics and the Huang-Lao movement. Its pragmatic outlook is founded on a kind of objective realism that is the signature of the famous fourth-century BC Jixia academy in the principality of Qi. It was this academy that consolidated several different schools of thought.*

Historians have for the most part regarded the *Guanzi* as a treatise on political economy, and have not appreciated its philosophical side. This is because it has come down to us in an incomplete, corrupt and reworked form. The current version was reputedly compiled by Liu Xiang (76-6 BC) and includes various kinds of texts, from short maxims and popular sayings to philosophical discourses and historical moralizings. Some chapters apparently were originally separate works, while others look like commentaries. The two main strains in the work seem to be the thought of Guan Zhong (the prime minister and architect of the economic dominance of the principality of Qi in the seventh century BC) and that of his anonymous disciples of the Han imperial epoch (second century BC to the second century AD).

Some of the ideas found in the *Guanzi* are reminiscent of legalism, including government by impersonal and invariable law, the concepts of 'profit' and 'propitious dates', the supreme position of the prince, the notion that one must adapt to circumstances with 'non-action' and that one must follow the will of Heaven as an impersonal, predetermined natural order (see Legalist philosophy, Chinese). Then there are other, more Confucian concepts: a respect for rituals that ensure social order by assigning a place to each person reflective of the inevitable differences in social status (the knowledge of how to allocate the places equitably being the mark of the Sage); a respect for unchanging, cosmic moral rules, the 'just way' (*dao*) and the cultivation of a 'sense of shame', along with a concern for the welfare of the people as necessary to the maintenance of good order (see Confucian philosophy, Chinese). In the *Guanzi*, Legalism is tinted by Confucian ideas while at the same time, Confucianism is influenced by Legalism and marked by a centralizing and authoritarian tendency closer to Xunzi than to Confucius. The two tendencies merge, respecting both the authority of the prince and the desires of the people.

The role of the prince is primary since he determines each person's rank and function, establishes laws and moral rules and hands out rewards and punishments. Being the central authority, he must exercise power by himself, maintaining rituals and dispensing law and punishments while also enforcing respect for political institutions. The prince must be a moral example, inspiring his people. His 'love' for the people is not purely humanitarian; it derives from the fact that the people, in their complete obedience, serve him and ensure his continued power without having any of their own. This contrasts with Confucius' insistence on the people's right and duty to give counsel, and Mencius' conception of the people's right to revolt against tyranny (see Mencius). In the *Guanzi*, the people need not be considered when their wants are individual and short-term; only the prince can decide how to evaluate the collective desires of his subjects and determine how to satisfy their deeper, long-term wishes.

The economic ideas in the *Guanzi*, with its insistence on the need to pay attention to prices and to seek a mean between poverty and excessive wealth, favour productivity and suggest some real commercial influence (see Economics, philosophy of). One famous chapter on 'the light and the heavy' is the first exposition of the need to watch over the circulation and amount of goods. However, the work also favours agriculture as a basic activity, ranking it higher than the occupations of craftsmen and merchants. The land itself constitutes the basis of government and its tax system. Emphasis is placed on the fair distribution of land, with attention to territorial organization and precise administrative boundaries, as well as to the nature of the soil and propitious dates. In this context there are several calendars, and a chapter on maps.

Alongside the notion of a Confucian-style *dao* or moral path and some Daoist-like ideas which had been rejected by the Daoists themselves, we also find chapters redolent of psycho-physiological Daoism, with ideas of non-action and the interior void that constitutes purity and receptiveness (see Daoist philosophy). In this vein there is also the idea of a metaphysical *dao*, ineffable and impossible to place, omnipresent as an all-encompassing void and as such, the source of all life. Paradoxically, a Confucian-like discussion on 'correcting names' is linked with a treatise on the Daoistic silence that the Sage must observe, a silence which allows for the establishment of an

indispensable, exact terminology.

Gurney, Edmund (1847-88)

Edmund Gurney was an English psychologist and musician. His major work, The Power of Sound, is a vast treatise on musical aesthetics, ranging from issues in the physiology of hearing to the question of the relation of music to morality, but is mostly devoted to central questions of form, expression and value in music. It is the most significant work of its kind in the latter half of the nineteenth century.

Commentators often couple Gurney with Hanslick as a supporter of musical formalism, but his views on the expressive dimension of music are neither as restrictive nor as doctrinaire as Hanslick's. Hanslick insisted on denying specific emotional content to music, allowing it only to convey dynamic features, which emotions, among other things, might exhibit. Gurney, on the other hand, grants that some music possesses fairly definite emotional expression, and discusses at length the grounds of such expression; he is primarily concerned to deny that musical impressiveness, or beauty, is either the same as or depends on musical expressiveness.

Gurney maintains that overall form in music is not of primary relevance to the appreciation of music. This is because the central feature of musical comprehension is the grasping of individual parts as they occur, and the grasping of connections to immediately neighbouring parts, whatever the overarching form of a piece might be. The value of a piece is directly a function of the pleasurableness of its individual parts and the cogency of sequence exhibited at the transitions between them, not a function of its global architecture.

1 Form, understanding and value in music

A cornerstone of Gurney's view of music is the contrast between the temporal art of music and the static visual art of two dimensions. He is struck by the difference between the apprehension of music and the apprehension of a linear arabesque or an architectural façade. While one can have a single sweeping perception of the whole of an arabesque or façade, a musical work allows one only a series of perceptions of its parts as it unfolds in time, never a single perception of the work in its entirety. The experience of music is fundamentally a matter of individual, overlapping impressions of short duration.

Despite the successiveness of our apprehension of them, however, moments of music often group themselves into extended units that we seem to grasp as a whole, though we cannot literally perceive them at one time. We find that some sequences of minute, heard events cohere together strongly when sequentially perceived, so that we hear them as single, unified movements. This is the phenomenon of melody, a string of successive auditory impressions somehow yielding a single impression comprising them all. When a sequence of notes constitutes a melody, the notes together display a certain minimum rightness. This rightness can be understood counterfactually, in terms of the effects, usually deleterious, of changing a single note. The special quality or character of a given melody is dependent on every note that comprises it; change any one and invariably the result is either no melody or another melody. The general outline or contour of a melody gives practically no sense of it at all; its essence lies in the specific notes that make it up, and not in anything more general that may be abstracted from them. No pitch or rhythm sequence, furthermore, possesses any inherent goodness in itself, and there are in fact no necessary and sufficient conditions discoverable for what constitutes a good melody.

Gurney later supplements this counterfactual criterion of melody with one that is more directly phenomenological. It is a mark of a melody that one is familiar with, that when one is strictly only hearing one part of it, it is *as if* one is also hearing the whole thing; one is in some way aware of the remainder while hearing any one part. 'When a melody is familiar to us we realize it by a gradual process of advance along it, while yet the whole process is in some real manner present to us at each of the successive instants at which only a minute part of it is actually engaging our ears' (1880: 165). It is this that Gurney famously labels 'Ideal Motion', noting that it is as much a characteristic of the process by which we perceive melody as of melody itself. The peculiarity of audible as opposed to visible form, of which melody is the paradigm, is that it is both formed, implying completeness, and at the same time moving or developing, implying incompleteness. Though Ideal Motion bears some analogy to physical motion, and often induces the latter in sympathetic listeners, it is a distinct phenomenon, neither reducible to nor proportional to the other. Gurney also notes a related feature of familiar melodies, namely that in listening to them one seems to construct them, with their characteristic tensions and overall flavour, in the very act of listening.

The emergence of melody is thus the chief way in which the moment-to-moment nature of musical apprehension is tempered and, to an extent, transcended. Gurney does, however, admit the existence of larger unities (musical paragraphs, for example) provided the components are bound together in a certain way. Although such paragraphs, unlike melodies, are not experienced as wholes, they can be internally unified in such a fashion that their successive parts do not strike a listener as unconnected to each other. What is required for this Gurney names ‘organicity’ or ‘cogency of sequence’ - the one and only adequate criterion of effective musical form, the *sine qua non* of well-formedness at any level. It is possessed by the succession of unprepossessing two- and three-note fragments that make up a melody, and by the succession of melodic and transitional passages that make up a unified musical paragraph. In the first case, one has parts, the individual tones, which are not themselves impressive, combined into a unit that is; in the second, the parts are already independently impressive, though they yield a whole that is impressive as well. In discussing what it is for a musical paragraph to constitute a form in the strict sense, Gurney offers a characterization of cogency of sequence in which its additional application to melody is plain: ‘any paragraph which is to be musically valuable must satisfy the test that each bit shall necessitate, as it were, and so enter into organic union with, the one next to it’ (1880: 204).

A sequence is cogent, then, when each part - whether motive, phrase, melody or paragraph - leads convincingly to the next, each consequent appearing, upon familiarity, to be the natural and inevitable continuation of its antecedent. Where there is cogency of sequence, there is resistance to any imagined substitution for any part in the musical chain, the test of cogency being precisely ‘the feeling of resentment…with which the ear, after sufficient acquaintance, would receive changes or omissions’ (1880: 212). Cogency of sequence admits of degrees, however. It reaches its apex within single melodies, tying together component motives or phrases, and can run fairly high in a paragraph composed of several melodic or quasi-melodic passages. But it is usually on the wane within extended movements made up of several sections, and generally approaches zero between the movements of large-scale works.

For Gurney, cogency of sequence - including unity of melody, which is a species of it - is a purely *intuitive* matter, judged by an autonomous musical faculty. It cannot be assessed or demonstrated by rational means; no formulable rules of repetition, contrast or balance can guarantee the presence of cogency or organicity. The musical faculty, in accord with the experiential criteria that have been mentioned, is the ultimate arbiter of musical form and effectiveness.

Gurney insists that the essential sequentiality of musical apprehension, and our inability to take in an extended portion of music as a whole at one stroke, entails the absolute primacy of the *parts* of a musical composition with regard to musical form, musical enjoyment and musical worth. The real form of a piece of music is wholly exhausted by the constitution of the smallest independent units out of formless elements, and the specific manner in which each independent unit leads on to the next. There is in no important sense an overall form to an extended piece of music; there is only form within and between parts that are successively apprehended. Musical enjoyment is likewise grounded entirely in the grasp of individual moments of various lengths and the transitions between them. ‘The whole is a combination of parts successively enjoyed, and can only be impressive so far as the parts are impressive’ (1880: 97). The parts, even taken out of context, are often of exceptional value; the whole comprising all the parts in order, on the other hand, carries no additional value of its own. As for relations which a given part may bear to other parts distant from it, these may affect one’s experience of the given part, but attention remains fixed on the part being heard, and not on any skein of relations encompassing the piece as a whole in which the part abstractly figures. Furthermore, though awareness of such relations may enhance one’s pleasure in what is then being heard, there is no distinct pleasure to be had in the relations themselves.

This view, which emphasizes the concrete detail of musical surface and its quality and connectedness from moment to moment, is clearly inimical to that to which music theorists often implicitly subscribe - namely, that elucidation and awareness of large-scale structural relations is of primary relevance to the understanding and evaluation of musical works, and that the whole is indeed as important as the parts, if not more so. Nevertheless, it seems that Gurney is fundamentally right in this respect. The simple insight at the root of his thought, and one that promoters of overall form tend to forget, is that music consists of a series of successive events which can never be apprehended simultaneously in a single perceptual act. The parts of a façade can be taken in more or less in one sweep, unlike the parts of a symphony. Of course, earlier portions of a musical work can be abstractly reviewed in memory as listening proceeds, or later portions entertained in anticipation, but that is not the same as the

perceptual experience of a whole. What is crucial, according to Gurney, is involvement in local movement from phrase to phrase, and not architectonic vistas beyond aural experience.

Gurney distinguishes finally between two modes of listening to music, the ‘definite’ and the ‘indefinite’. His conclusions concerning musical form, value and enjoyment all presuppose listening that occurs in the definite mode. Someone listening definitely attends to the specific features of the melodic and harmonic motion of the music as it passes, registers the individuality of what they hear, and typically acquires a recognitional capacity for those parts of form as a result. Definite listening is active, alert, participatory and particularizing. Someone listening indefinitely, on the other hand, is mainly aware of a succession of sounds, and reacts to and registers only gross changes in the overall sound-image.

2 Beauty and expression in music

Gurney is a musical formalist in the following respects. First, he posits an autonomous musical faculty, whose charge is the grasping and assessing of musical forms. This faculty derives from the apprehension of ‘impressive’ forms, that is, ones that can be synthesized as wholes in the short span, and which thus exhibit Ideal Motion, a distinct and *sui generis* pleasure. Second, he maintains that the impressiveness of musical forms - their purely musical beauty - is not different from but entirely independent of whatever ‘expressiveness’ they possess. But Gurney, unlike Hanslick, clearly accepts the phenomenon of musical expressiveness and devotes considerable attention to it (see Hanslick, E.). He begins, in anticipation of Goodman’s claim that expressive properties are only metaphorically possessed, by observing that a thing does not express its central or defining attributes, but rather its incidental (or ‘occasional’) ones, for only the latter display sufficient separability from the thing to allow them to be expressed. Gurney’s specific analysis of musical expressiveness is thus: ‘when a particular feeling in ourselves is identified with a particular character in a particular bit of music, then we say without hesitation that such a particular bit *expresses* the quality or feeling’ (1880: 313). This formulation can evidently be construed in both an arousalist and a cognitivist way, depending on how the phrase ‘a particular feeling in ourselves’ is understood; indeed Gurney seems to waver between the two in subsequent discussion. On the first construal, what is expressed by music is necessarily some feeling evoked in us as we listen. On the second construal, what is expressed is a feeling that we have experienced and are familiar with, and which we are disposed to relate to the character of the part being heard, but this is not necessarily something we are then experiencing; it is a feeling the music suggests to us, rather than awakens in us.

An additional complication in Gurney’s account is that although the ‘feeling in ourselves’ by which the expressiveness of the music is gauged is in most cases the same as the quality we ascribe to the music, it is in some cases rather the feeling that *contemplation* of the quality ascribed is apt to induce in us. Thus, while the special feelings corresponding to melancholic or joyful music are melancholy and joy, those corresponding to humorous and terrible music, that is, music expressive of humour and terror, are amusement and fear, not wittiness or menace. Unfortunately, Gurney gives no principled criterion for when the relationship between expressed feeling and feeling in listeners conforms to the direct, as opposed to the indirect, model.

Gurney holds that the grounds of musical expressiveness are to be found in the resemblances between music and human behaviour that is expressive of emotion. Musical motion, in its pace, rhythm and shape, echoes that exhibited in the gestures, movements and vocal inflections that outwardly manifest human feeling. Gurney holds that a certain asymmetry obtains when accounting for expressiveness, which partly parallels the absence of criteria for impressiveness. When a moment or section of music expresses an emotion, it is always possible to find structural features of the music that, by underpinning a resemblance to standard expressive behaviour, are largely responsible for the expressiveness, and thus explain it; but we cannot reverse this procedure and dependably predict, on the basis of its structural features, the emotion that a moment or section of music will express.

Gurney’s arguments concerning impressiveness and expressiveness have a variety of targets and are of varying soundness. Some are designed merely to underline the difference between impressiveness and expressiveness, some are aimed at denying any dependence of impressiveness on expressiveness, and some are concerned with the different bearing of the two on musical worth.

Gurney notes that in much impressive music ‘definable expression’ is absent and that much music with ‘definable expression’ fails to be impressive. Thus - on the assumption that definable expression and

expressiveness are the same - expressiveness is distinct from, and neither necessary nor sufficient for, impressiveness. And reinforcing for Gurney the nonidentity of expressiveness and impressiveness is the fact that assessments of expressiveness often vary widely for different listeners, while judgments of impressiveness roughly coincide. But Gurney goes on to assert that musical features that are intended to bring about the definite expression of some emotion will only do so if the music is impressive as well - suggesting that impressiveness, far from depending on expressiveness, may even be a necessary condition of it.

Gurney notes that pieces with equivalent expressiveness are often musically valuable in different ways, so that we would not be content to keep one and not the other. He concludes that the musical value of such pieces must be independent of the expressiveness they have in common, and observes that emotions are expressed by human behaviour even more directly and unequivocally than by music, yet the former is not seen as a source of aesthetic satisfaction; again, the aesthetic worth of music cannot rest merely on its capacity to express emotion.

Reviewing the above, it is evident that Gurney does not sufficiently consider the possibility that *part* of a piece's value might reside in its expressiveness, even if its expressiveness is shared with other pieces, and even if a concomitant impressiveness is required for that value to be realized; nor does he consider that value might reside in the particular *way* in which music, as opposed to ordinary behaviour, is expressive of emotion; nor that the *interplay* of expressiveness and impressiveness in a given piece might be a focus of interest.

It is sometimes ventured that music, through its almost infinite variety of forms, might have the ability to convey correspondingly fine nuances of feeling, and thus might outstrip what word or gesture can accomplish in expressive capacity. However, if one holds with Gurney that the only way in which music is expressive is in its reflection of the normal, behavioural expression of emotion, then the idea that music will be able to express finer shades of emotion than are already differentiated in the full range of human behaviour necessarily comes to grief. On this hypothesis, the emotional suggestions of musical form and content can be no more finely-grained than pre-existing correlations of behaviour with emotion, by reference to which such suggestions are accomplished at all.

Finally, Gurney examines with devastating results the thesis that expressive music expresses the emotions of its creator. First, there is the gross implausibility of the claim that an extended piece might track the regularly fluctuating feelings of the composer; second, music expressive of a feeling is clearly composable by one who is not experiencing that feeling and has perhaps never experienced it; and third, observation gives no support even to any rough rules connecting the expressive character of a piece and a composer's contemporaneous state. A more plausible thesis, according to Gurney, proposes only that the dominant character of a composer's music, as evidenced in their entire *oeuvre* or a significant portion thereof, reliably reflects the composer's characteristic psychological condition.

Ha'am, Ahad (1856-1927)

Ahad Ha'am (Asher Hirsch Ginzberg) was one of the most remarkable Jewish thinkers and Zionist ideologists of his time. Born in the province of Kiev in the Ukraine, he moved in 1884 to Odessa, an important centre of Hebrew literary activity. In 1907 he moved on to London, and in 1922 settled in the young city of Tel Aviv. He attended the universities of Vienna, Berlin and Breslau but did not pursue any regular course of study and was primarily an autodidact. Never a systematic philosopher, Ginzberg, who wrote in Hebrew and adopted the pen name Ahad Ha'am, 'one of the people', became a first-rate and widely read essayist and polemicist. He engaged in controversies over the practical problems of the early Jewish settlements in Palestine, his opposition to Theodore Herzl's drive to create a Jewish state, and numerous problems of Hebrew culture, tradition and literature. No single principle or theme stands out as the guiding idea of his thought. Indeed, his ideas are sometimes inconsistent. But his writings preserve the flavour of his values and commitments. Although his outlook never became the main road of Zionist ideology, its impact on Zionist thought was powerful, especially after the establishment of the State of Israel.

1 Jewish nationhood

Ahad Ha'am's thinking was strongly influenced by nineteenth-century evolutionism and the philosophy of Herbert Spencer. Unlike most other Jewish thinkers of his time, he was more under the spell of English and French than German philosophers, but he applied his eclectic thinking most concertedly to the complex of difficulties known in his time as 'the Jewish problem'. Jewish nationality, like any other, he argued, is acquired naturally - unlike the moral idea of humanity, which is derived from abstract reasoning. It is grounded in a spontaneous sentiment of national belonging, akin to family ties and needs no theoretical justification. For the sense of national belonging is prior to consciousness itself; it springs from a kind of biological impulse and is felt as an emotion, rather than reasoned like a universal moral truth.

A people, like any organism, Ahad Ha'am reasoned, strives for self-preservation. This national 'will to live' is the resultant of every individual's will to live. But its demands take precedence over individual survival, since the nation will endure long after the individual's death. Indeed, the national 'urge to survive' is not merely a Darwinian biological concept but a cultural and social imperative. Following up on a Hegelian idea elaborated by the Jewish philosopher Nachman Krochmal in the 1840s, Ahad Ha'am maintained that every nation has its own distinctive spiritual character. This spiritual factor, and no mere political fact like statehood, was the true expression of peoplehood and the true basis of national survival. Diverging from his positivist and evolutionary bent, Ginzberg turned here towardss ideas influenced by German idealism and romanticism. Every national spirit, he observed, has its sources in the past. In Judaism the national idea is inspired by the moral teaching of the Hebrew prophets. Thus the core of the Jewish spirit is not ultimately a matter of religion but of ethics (see Cohen, H.). Unlike many previous thinkers, Ahad Ha'am found the core message of Jewish ethics in turn not at the individual but at the social level, in the prophet's uncompromising insistence on objective justice, not mere love or compassion. What matters is the act, not the agent or the intention. He drew this theme from his reading of the Jewish sources, but he did not restrict it to Judaism. He conceived of the quest for justice as the universal human quest and thus found a world historical mission in the particularities of Jewish history. But the enduring message and the enduring bond were not those of religion. Monotheism and messianism, to be sure, had played their parts historically in upholding the national will to existence. But with the rise of secularism the Jewish religion could no longer unify the Jewish people. The historico-religious bond had crumbled. Ahad Ha'am himself had become a secular Jew, and he looked forward to the emergence of a new Judaism that would take over the unifying role once played by religion. Modern Judaism will respect the Jewish religion as the most significant creation of the Jewish people; but it can no longer accept that religion's imperatives. For these are not divine commands but historical expressions of peoplehood. These ideas of Ahad Ha'am's were later taken up by the American Jewish philosopher Mordecai Kaplan.

2 The spiritual centre

Despite the Hegelian and romantic essentialism at the root of his ideas of the Jewish spirit, it was in a Spencerian vein that Ahad Ha'am addressed the Jewish urge for survival, arguing, in effect, that there is no Jewish national

problem, any more than there is a French or English problem. The peculiarity of the Jewish question derives only from the complexity of the Jewish situation. Assimilation, long identified as a critical issue for the Jews of the diaspora, is the most portentous of the problems faced in that situation. In his famous essay 'Hikkuj ve-Hitbollelut' (Imitation and Assimilation) (1893), Ahad Ha'am defines assimilation as the disappearance of the natural will for national survival. This contretemps is seen by him as a danger to Jews only as individuals. Surprisingly, it need not threaten Jewish peoplehood. For Judaism, he reasoned, could be saved by the establishment of a spiritual centre in Palestine. The message of Judaism emanating from this centre to the Jewish periphery - the message oriented by the moral exhortations of the Hebrew prophets - will strengthen national consciousness in the diaspora and endow spiritual life with a true national content. It will thereby constitute an effective barrier against assimilation, without need of a state, as called for by the political Zionists of Theodore Herzl's movement (see Zionism).

The question remained, of course, whether the Jews to be influenced by the centre would willingly follow those who hoped to influence them. Clearly Ahad Ha'am's schema of spokes and a wheel more adequately reflects present-day relations between Israel and world Jewry than did the maximalist ideology that often characterized political Zionism. Yet, contrary to his hopes, even the State of Israel and the activity of its emissaries in the diaspora, not to mention the many cultural and educational institutions it shelters, have only partially arrested the trend towards assimilation among Jews in their countries of residence. The Jews of those lands have not come to see Israel as their capital; and Israel itself, in an ironic commentary on Ahad Ha'am's vision, is fully subject to the same forces that drive much of the assimilation of diaspora Jewry.

Ahad Ha'am's cultural Zionism was his alternative to assimilation on the one hand and political Zionism on the other. Unlike Pinsker and Herzl, whose Zionism was triggered by the collision of Jews with their social and political environment, and especially by the growth of anti-Semitism, Ha'am believed the Jewish predicament to consist in growing to feel too much at home in that environment and becoming estranged from the Jewish national heritage. His sensitivity to the problem of assimilation indeed tended to blind him to the threat of tragedy that hung over the diaspora Jewry in the form of anti-Semitism.

Habermas, Jürgen (1929-)

Jürgen Habermas, German philosopher and social theorist, is perhaps best known for his wide-ranging defence of the modern public sphere and its related ideals of publicity and free public reason, but he has also made important contributions to theories of communication and informal argumentation, ethics, and the foundations and methodology of the social sciences. He studied in Göttingen, Zurich and Bonn, completing a dissertation on Schelling's philosophy in 1954. After working for a short time as Theodor Adorno's research assistant at the Institute for Social Research in Frankfurt he held professorships in Heidelberg and Frankfurt and, from 1971 to 1981, was co-director of the Max Planck Institute in Starnberg. With the publication of Knowledge and Human Interests (1968) he became widely recognized as the leading intellectual heir to the Frankfurt School of Critical Theory, a variant of Western Marxism that included such figures as Adorno, Max Horkheimer and Herbert Marcuse. His two-volume The Theory of Communicative Action (1981) is a major contribution to social theory, in which he locates the origins of the various political, economic and cultural crises confronting modern society in a one-sided process of rationalization steered more by the media of money and administrative power than by forms of collective decision-making based on consensually grounded norms and values.

1 Early work

In his first book, *The Structural Transformation of the Public Sphere* (1962), Habermas traces the emergence of a bourgeois public sphere which, at least for a time, offered the prospect of an arena that would mediate between state and society. Rooted in the social and economic conditions of liberal capitalism, the 'bourgeois public sphere' refers to those sociocultural institutions that arose in the eighteenth century in opposition to the absolutist powers of the state - private clubs and coffeehouses, learned societies and literary associations, publishing houses, journals, and newspapers. Taken as a whole these institutions constituted a 'public realm of reasoning private persons' that was partially secured through the enactment of various constitutional rights and liberties. In theory and (to a more limited extent) in practice, this public sphere was distinct both from the private sphere of the market and the family and from the political authority of the state. It designated a sphere that comes about whenever private persons reason collectively about their common interests, and its function was both to restrain and legitimate the political power exercised by the administrative state.

Habermas' thesis, however, is that this idea of the public sphere had a very limited lifespan. At the level of theory, the idea of a 'reasoning public' was treated with suspicion by conservatives and progressives alike and, in liberal theory, the defence of a public sphere was often limited to the formal guarantee of a narrow set of 'natural' civil and political rights. As an historical phenomenon, the bourgeois public sphere suffered an equally unfortunate fate. In connection with what he refers to as the 'refeudalization' of civil society during the latter part of the nineteenth century, Habermas traces the commercialization of civil society, the bureaucratization of political and non-political authority, and the growth of a manipulative or propagandistic mass-media. A 'repoliticized social sphere' erodes the real distinction between state and society that is a necessary social condition for the bourgeois public sphere, and a society oriented to consumption and a politics based on the competition and bargaining between interest groups emerges in the place of a public sphere formed by an enlightened citizenry. Although Habermas never abandons the normative claims expressed in the bourgeois ideal, the conclusion of *The Structural Transformation of the Public Sphere* is extremely cautious about the possibility for a renewed public sphere under the altered conditions of late capitalist society. Only thirty years later in *Between Facts and Norms* (1992) does Habermas return, on a more optimistic note, to the prospects for democracy in complex, pluralist societies.

In the 1960s and 1970s, Habermas pursued a number of related issues. He sharply criticized the 'scientization of politics' and increase in 'technocratic consciousness' he discerned in contemporary societies. For Habermas the growth of technocracy was not inevitable but the result of a failure to preserve (albeit by other means) the classical distinction between theory and practice, and between practical wisdom (*phronēsis*) and technical skill (*technē*). In a series of influential essays, many of which are collected in *Theory and Practice* (1963), he traced the loss of these distinctions in modern political theory (from Hobbes to Hegel) as well as in Marx whose own concept of praxis blurred a related and equally important distinction between labour (*Arbeit*) and modes of social interaction based on shared interpretations of the world. Thus, contra Marx, Habermas argues that the end of alienated labour does not alone ensure social emancipation.

During this same period, Habermas also pursued a more systematic critique of positivism, found in his contributions to the so-called ‘positivist dispute’ in German sociology and in his popular study, *Knowledge and Human Interests* (1968). The latter work traces the ‘dissolution of epistemology’ from its origin as a critical enterprise with Kant to its status as a relatively uncritical ‘theory of science’ in the first half of this century. Positivism (or scientism), for Habermas, is the insistence that only the sciences constitute genuine knowledge together with the belief that science does not need any further critical analysis or justification. It refers less to the practice of the sciences than to their ‘scientistic self-misunderstanding’. Habermas challenges this view (which was still popular at the time) and attempts to secure an independent basis for critique by arguing that all forms of knowledge are rooted in fundamental human interests. He identifies three ‘quasi-transcendental’ or ‘anthropologically deep-seated’ cognitive interests with reference to which distinct forms of knowledge can be delineated: the natural sciences correspond to a technical interest; the historical-hermeneutic sciences, to a practical interest; and the critical sciences (for example, Marxism and psychoanalysis when each is freed from its own ‘scientistic self-misunderstanding’), to an emancipatory interest. Thus, through a kind of continuation of epistemology by social theory, Habermas sought to complete a critique of positivism and provide a ‘prolegomenon’ for a critical social theory. Though he quickly became dissatisfied with the anthropological underpinnings of this initial attempt, there are already hints of the ‘linguistic turn’ in his later theory, evident, for example, in his remark that ‘the human interest in autonomy and responsibility is not mere fancy, for it can be apprehended a priori. What raises us out of nature is the only thing whose nature we can know: language’ (1968: 314) (see Positivism in the social sciences).

2 *The Theory of Communicative Action*

The Theory of Communicative Action (1981), Habermas’ magnum opus, is a major contribution to social theory which in its aim and structure resembles Max Weber’s *Economy and Society* and Talcott Parson’s *The Structure of Social Action*. Like those works, it presents metatheoretic reflections on the basic concepts of social theory along with observations on the methodology of the social sciences and quasi-empirical hypotheses about modernization as a process of societal rationalization. However, in contrast particularly to Weber, Habermas does not regard rationalization as a process that inevitably culminates in the loss of meaning and freedom in the world, but as an ambivalent process that also opens up a potential for societal learning and new levels of human emancipation.

Like Weber and Parsons, Habermas begins with a set of metatheoretic reflections that yields a typology of action. His basic distinction is between ‘consent-oriented’ (or communicative) and ‘success-oriented’ (or purposive-rational) actions; within the latter he distinguishes further between strategic and instrumental action. Instrumental actions are goal-oriented interventions in the physical world. They can be appraised from the standpoint of efficiency and described as the following of technical rules. Strategic action, by contrast, is action which aims at influencing others for the purpose of achieving some end. It too can be appraised in terms of its efficiency and described with the tools of game theory and theories of rational choice (see Rational choice theory). Many instrumental actions can also be strategic, and some forms of strategic action may be instrumental. Communicative action, however, constitutes an independent and distinct type of social action. The goal or ‘telos’ of communicative action is not expressed or realized in an attempt to influence others, but in the attempt to reach an agreement or mutual understanding (*Verständigung*) about something in the world. Thus, while all action is teleological or goal-oriented in a broad sense, in the case of communicative action any further ends the agent may have are subordinated to the goal of achieving a mutually shared definition of the agent’s lifeworldly situation through a cooperative process of interpretation. In acting communicatively, individuals more or less naïvely accept as valid the various claims raised with their utterance or action and mutually suppose that each is prepared to provide reasons for them should their validity be questioned. In a slightly more technical (and controversial) sense, and one tied more specifically to modern structures of rationality, Habermas also holds that individuals who act communicatively aim at reaching understanding about something in the world by relating their interpretations to three general types of validity claims that are constitutive for three basic types of Speech acts: a claim to truth raised in constative speech acts, a claim to normative rightness raised in regulative speech acts, and a claim to truthfulness raised in expressive speech acts (1981, vol. I: 319-).

At a methodological level, this analysis of social action underlines the need for an interpretive or *Verstehende* approach in the social sciences. The requirement of *Verstehen* arises because the objects that the social sciences study - actions and their products - are embedded in ‘complexes of meaning’ (*Sinnzusammenhänge*) that can be

understood by the social inquirer only as he or she relates them to his or her own pre-theoretical knowledge as a member of the lifeworld. This, in turn, gives rise to the 'disquieting thesis' that the interpretation of action cannot be separated from the interpreter's taking a position on the validity of the claims explicitly or implicitly connected with the action. The process of identifying the reasons for an action unavoidably draws one into the process of assessment in which the inquirer must adopt the perspective of an (at least virtual) participant. Understanding the reasons for action requires taking a position on the validity of those reasons according to our own lights, and that means (at least initially) setting aside an external or 'third person' perspective in favour of an internal or 'first person' perspective in which both agent and interpreter belong to the same 'universe of discourse'. It is in this way that Habermas is able to connect the notion of rationality generally with his more specific claims that reason is a capacity to test validity claims.

However, despite his emphasis on social (or communicative) rationality with its ties to criticizable validity claims, Habermas does not think that society can be viewed as a sort of large-scale debating club. On the one hand, agents' interpretations are generally taken for granted and form part of an implicit background of knowledge and practices that constitute what he calls (following Edmund Husserl and Alfred Schutz) the 'lifeworld'. On the other hand, social integration can also be achieved in large measure by relegating tasks of action coordination to social institutions that operate, so to speak, 'behind the backs' of social agents. In fact, Habermas' distinction between society as lifeworld and society as system reflects a trend toward differentiation that is yet another feature of modern societies.

Beyond these metatheoretic and methodological concerns, *The Theory of Communicative Action* presents an interpretation of modern society as the outcome of a process of rationalization and societal differentiation. Rationalization, as in Weber, refers most generally to the extension of the criteria of rational choice and purposive-rational action to ever more aspects of social life (for example, science, law, business, and even religion and the arts). Differentiation in modern societies is reflected, first, in a (functional) separation of the economic and political subsystems from society as a whole and, second, within the lifeworld, in the division among institutional complexes devoted, respectively, to the tasks of the transmission of knowledge and interpretive patterns (culture), social integration ('society' in the narrower sense of normative orders), and socialization (personality). Finally, within culture one can also trace a differentiation among the three values spheres of science and technology, law and morality, and art and aesthetic criticism as each becomes independent of the other and develops its own internal standards of critique and evaluation. This interpretation of modern society as a process of rationalization is, of course, not new. However, in contrast to the classical theorists who generally viewed it as a threat to social life - Weber's 'iron cage', Marx's thesis of reification, Durkheim's analysis of anomie - Habermas emphasizes the potential for emancipation also made available. Thus, social pathologies are not an inevitable consequence of rationalization *per se* but result rather from a one-sided process in which the market and administrative state invade the lifeworld, displacing modes of integration based on communicative reason with their own form of functional rationality. Habermas dramatically describes this as the 'colonization of the lifeworld'. The primary task of a critical theory is to draw attention to this process of colonization and indicate the ways in which various social movements are a response to it (see Social sciences, philosophy of).

3 Discourse ethics

Habermas' development of a discourse (or communicative) ethics is an important corollary of his theory of communicative action and represents his formulation of a post-conventional moral theory as an alternative to utilitarianism and Kantian theories. Its basic idea is expressed in a principle of universalizability, analogous to the categorical imperative of Kant, which is intended to function as a rule of argumentation for testing the legitimacy of contested norms. The principle reads:

> Every valid norm must satisfy the condition that all affected can accept the consequences and the side effects its general observance can be anticipated to have for the satisfaction of everyone's interests (and these consequences are preferred to those of known alternative possibilities).
>
> (Habermas 1983: 65)

Habermas' strong claim is that this principle can be derived from the general pragmatic presuppositions of communication and argumentation. His strategy runs roughly as follows: In making utterances, speakers at least

implicitly raise different types of validity-claims - for example, claims to truth, normative rightness, and sincerity or truthfulness. These validity-claims, in turn, point to the notion of an ideal speech situation freed from all external constraints and in which nothing but the force of the better argument prevails. The principle of universalizability represents an attempt to formulate this counterfactual ideal as a constitutive rule of argument for moral-practical discourses: norms or maxims of action are only morally legitimate if, when contested, they could be justified in a moral-practical discourse (see Communicative rationality).

Discourse ethics shares several features with other broadly Kantian moral theories. It is a formalistic ethic in the sense that it does not presuppose substantive moral content (beyond the idea of practical reason) but rather specifies a formal procedure which any norm must satisfy if it is to be morally acceptable. It is also a cognitivist ethic, not in the sense that it supposes an independent order of moral facts, but in its insistence that there exists a sufficient analogy between moral discourse and scientific discourse to make it possible to speak, for example, of progress in learning or of a comparable notion of 'good reason' or argument in both. Finally, discourse ethics is a deontological moral theory in two senses. It assumes the priority of the right over the good. The basic moral principle must be specified in a way that does not presuppose a specific conception of the good life since that would violate the liberal commitment to a plurality of conceptions of the good. In a further sense the distinction between deontological and teleological theories is closely related to Kant's distinction between categorical and hypothetical imperatives, a distinction strongly contested in contemporary analytic moral philosophy. Habermas sides with those who argue that morality consists of categorical imperatives (imperatives that do not require non-reason-based interests or desires), but agrees with critics that Kant's defence of such imperatives was not successful. In his own theory, Habermas accounts for the obligatory character of moral norms in terms of their relation to communicative action: valid norms are morally binding because of their intimate connection with processes of social interaction and communication out of which one cannot easily (or even rationally) choose to step (1983: 109).

At the same time, discourse ethics differs from Kant's moral theory in some important respects. It breaks with Kant's two-world metaphysics (phenomenal/noumenal) and rejects his exclusively monological interpretation of the categorical imperative in favour of an intersubjective or communicative version of the principle of universalizability. Of course, Kant's categorical imperative - especially in its 'Kingdom of Ends' formulation - already has an intersubjective dimension to it. However, it is only because of his two-world metaphysics that Kant is able to equate what one person can consistently and rationally will with what everyone could consistently and rationally agree to. Only because interests, desires and inclinations are set over against reason and purged from the Kingdom of Ends can Kant assume a harmony between the individual and the collective rational will. In communicative ethics, by contrast, such simulated thought experiments should ideally be replaced by practical discourses. Even though any actual discourse will always be limited by constraints of space and time and will thus fall short of their ideal, virtual dialogues carried out by a few on behalf of others are not an adequate substitute.

It is perhaps still too soon to tell whether discourse ethics represents a distinct alternative in contemporary moral theory. On the one hand, it must respond to some of the same challenges that confront other impartialist theories and it has to make good its claim that a notion of rational consensus or rational acceptability (distinct from the Hobbesian sort) provides the best general account of more ordinary moral intuitions. On the other hand, discourse ethics does seem to capture central insights that have made utilitarian and Kantian theories attractive: It regards respect for individual integrity (or 'autonomy') and concern for the welfare of others (or 'solidarity') as two aspects of the abstract notion of equal respect implicit in the idea of communicative action (see Kantian ethics; Utilitarianism).

4 Politics and law

In *Between Facts and Norms* (1992) Habermas returns to the political questions that guided his early studies and outlines in greater detail some of the implications of *The Theory of Communicative Action* for democratic theory and practice. A central claim of the work is that the common contrast between democracy (or popular sovereignty) and constitutionalism (with its emphasis on individual rights) is overdrawn since each is conceptually dependent on the other. Popular sovereignty and basic rights are co-original (*gleichursprünglich*) in that each derives from an ideal implicit in the notion of communicative reason: the right not to be bound to norms other than those to which one could give uncoerced rational consent. Moreover, by stressing the procedural dimensions of communicative

reason Habermas offers a model of 'deliberative politics' that steers between the alternatives of liberalism and republicanism (or communitarianism). In particular, with the republican model, it rejects the vision of the political process as primarily a process of competition and aggregation of private preferences. However, more in keeping with the liberal model, it regards the republican vision of a citizenry united and actively motivated by a shared conception of the good life as unrealistic in modern, pluralist societies. By contrast, as he puts it, 'the success of deliberative politics depends not on a collectively acting citizenry but on the institutionalization of the corresponding procedures and conditions of communication, as well as on the interplay of institutionalized deliberative processes with informally constituted public opinions' (1992: 298). Central to this model is not only the institutionalization of different forms and levels of discourse that, taken together, allow for (a reasonable expectation of) a rational public opinion and will-formation, but, as the quotation indicates, a 'two-track' process in which there is a division of labour between 'weak publics' - the informally organized public sphere ranging from private associations to the mass media located in 'civil society' - and 'strong publics' - parliamentary bodies and other formally organized institutions of the political system. In this division of labour, 'weak publics' assume a central responsibility for identifying, interpreting and addressing social problems. Decision-making responsibility, however, as well as the further 'filtering' of reasons via more formal parliamentary procedures, remains the task of a strong public (for example, the formally organized political system).

Within legal theory Habermas also resists the sharp contrast between positivism ('law as the will of the sovereign' (see Legal positivism)) and natural law theories (see Natural law). Legitimate law must in some meaningful sense be construed as the will of the people or demos, yet a democratic process itself requires legal regulation. 'The idea of the rule of law [or 'constitutional state' (*Rechtsstaat*)] sets in motion a spiralling self-application of law' (1992: 39). Habermas' response to this paradox is twofold. At an institutional level he pursues a strategy of differentiation: legal discourses are but one (albeit important) form of discourse that must simultaneously constrain yet be pervious to other forms of practical discourse. This leads to a reformulation of the classical separation of powers in discourse-theoretic terms. At a normative level, he advocates a 'public reasons' approach similar to the recent proposal by John Rawls: ordinary law-making is subject to a higher law of 'constitutional essentials' (Rawls 1993: 227), but these essentials are themselves ultimately justified in terms of their ability to realize effectively citizens' basic moral powers - Habermas speaks of their 'public' and 'private' autonomy - and give expression to an ideal of free public reason (see Liberalism; Republicanism).

5 Habermas as polemicist

Throughout his career Habermas has been a frequent participant in cultural and political debates as well as more narrowly academic discussions. In fact, his reputation, at least in Germany, may be due as much to these interventions in public life as to his academic writings. From the 1950s when he challenged Heidegger's willingness to publish his 1935 lectures, Introduction to Metaphysics, without any apology for its support of fascism, through his spirited debates with radical students in the 1960s, his response to neoconservatism and the 'historian's debate' in the 1980s (which concerned the public use of revisionist historical interpretations of the 'final solution' for politcal purposes), and his reflections on nationalism and European identity in the 1990s, Habermas has exemplified in practice the ideals of the public sphere he has defended in his academic writings.

One of the more widely discussed of these debates is his engagement with postmodernism. In *The Philosophical Discourse of Modernity* (1985) Habermas argues that much of postmodern thought (from its roots in Nietzsche and Heidegger through to its representatives in Foucault and Derrida) rests ironically on a failure to break sufficiently with the modern philosophy of consciousness (or *Bewußtseinsphilosophie*) against which so much of its criticism is directed. Within this tradition, the (knowing and acting) subject is regarded either as one object among others in the world (and thus, too, as something to be dominated) or as a 'transcendental' subject whose conscious activity, while always presupposed, can itself never be consciously apprehended. Most modern and contemporary philosophy - including postmodernism or deconstructionism - oscillates between these alternative positions, thereby rendering incoherent their own normative claims and critical positions. Habermas argues (as he did in *The Theory of Communicative Action*) that one can escape the bottlenecks of the philosophy of consciousness only by making a 'paradigm shift' to a model of communicative action in which subjectivity is first approached through the intersubjective relations individuals establish with one another in the medium of language. Autonomy, for example, is then less a property that the individual agent obscurely possesses than it is a set of competencies that actors mutually ascribe to one another in specific forms of social interaction. Habermas' aim, once more, is to

show that the positive achievements of modernity can be salvaged from their shaky metaphysical foundations without, however, requiring that one relinquish a rational (or reasonable) grounding for normative criticism. Modernity thus remains for Habermas an 'unfulfilled project', though one that should not be abandoned (see Postmodernism).

Haeckel, Ernst Heinrich (1834-1919)

Haeckel was the leading German Darwinist. His evolutionary philosophy of monism differed substantially from the views of Darwin or of British evolutionary philosophers such as Herbert Spencer or the dualist T.H. Huxley. Haeckel's monism asserted the unity of physical and organic nature, and included mental processes and social phenomena. Its initial form was mechanistic, seeking to reduce vital processes to physicochemical laws and substances. However, his efforts to construct the history of life meant that Haeckel became preoccupied with historical processes. In its final form, his monism was pantheistic. AlthoughHaeckel has been regarded as a forerunner of national socialism, a contextual reading of his works does not support this interpretation.

Haeckel studied medicine and zoology. His approach to biology should be contrasted with the reductionist biophysics programme of the physiologists Hermann Helmholtz, Emil Du Bois-Reymond and Rudolf Virchow. During the 1850s Virchow (for whom Haeckel was assistant) moved away from reductionism to a belief in distinct organizational properties of life - notably in the cell. Haeckel was influenced byVirchow's theories of cellular organization and by the vitalist comparative anatomist and physiologist, Johannes Müller. More distant influences included Goethe's concept of morphology (see Goethe, J.W.) and the *Naturphilosophen* Lorenz Oken and Friedrich Schelling.

Darwin's *Origin of Species* inspiredHaeckel to advance Darwinism scientifically and as a popular form of materialist ethics (see Darwin, C.). This coincided with Max Schultze's protoplasmic theory of the cell, which gave Haeckel the idea that the cell substance or 'Plasma' was equivalent to the first-formed life. All organisms were plasmatic bodies differing only in degrees of organization. In linking cell theory to evolutionary theory, Haeckel was not a conventional Darwinist. Natural selection assumed only a limited role, being circumscribed by environmental and historical forces: Haeckel endorsed Lamarckian factors, such as the direct effects of the environment.

In reconstructing the history of life, Haeckel adopted a causal and mechanistic approach: in the 1870s he developed the 'biogenetic law' that ontogeny (the development of an individual organism) recapitulated phylogeny (the evolution of the species). The Gastraea Theory of 1874 deduced an extinct primitive organism (the Gastraea) that explained the early stage of embryological development, which Haeckel termed 'gastrulation'. Past evolutionary history provided a causal explanation of development.

Haeckel's monism was first developed in the *Generelle Morphologie (General Morphology)* of 1866. It implied that there was no essential difference between organic and inorganic nature, life differing from inorganic nature only in its higher organization. Atoms had immanent properties of irritability. Substance united matter and spirit. Haeckel liked to evoke the image of 'crystal minds' (*Kristalseelen*) to convey the link between matter and mind. There were two fundamental laws of substance: that of energy and material as constant throughout the world, and that of evolution from the unformed to the fully formed. Similarly there was no fundamental difference between animals and the human species. All mental powers were derived from sensitivity and movement. Ethics was based on the natural sciences, particularly the evidence of the social instincts of animals. The advance of science had the consequence of making mankind more aware of the rationale of the new morality. Certain aspects of modern civilization could be condemned as degenerative.

Haeckel drew on non-Darwinian concepts of division of labour in order to demonstrate that a centralized nervous system was an essential feature of the evolution of higher organisms. Following Spencer, he argued that the more an organism was differentiated the greater its need of centralized coordination and control. He appliedVirchow's egalitarian concept of a 'cell state' in a hierarchical fashion to argue that higher organisms manifested greater centralization, just as empires were higher than republics.

Haeckel condemned Christianity, and especially Roman Catholicism, as a primitive superstition, accusing Christianity of despising nature. Monism should replace religion as the basis of education in the newly united nation. At the same time he denied liberal notions of free will, which led to controversy with Virchow in 1877. Virchow viewed Darwinism only as an hypothesis, whereas forHaeckel it was a proven law. This was the first of a number of disputes over the processes of development and heredity that leftHaeckel scientifically isolated. His

increasing popularity compensated for this, as his ideas contributed to the development of psychology, sociology and psychoanalysis. In 1906 Haeckel was a founder of the Monist League, in which he encountered opposition to his pantheism, particularly from the physicist Wilhelm Ostwald.

It has been suggested thatHaeckel’s monism supplied the scientific roots of National Socialism (Gasman 1971). He certainly endorsed eugenics, and from 1905 he was an honorary member of the German Society for Racial Hygiene. Although on occasion personally anti-Semitic, Haeckel’s monistic philosophy did not support anti-Semitism. However, his anthropology was based on progression from ’primitive races’ to Europeans. While for primitive races the survival of the fittest had been a historical factor, higher civilized races were immune from its workings. In 1872 he argued that the death penalty was necessary for irredeemable criminals, and ascribed ’less value’ to weak and sick persons.Haeckel noted that euthanasia of the malformed and crippled new-born children had served to maintain the military prowess of the Spartans, but that it had no place in modern, civilized society. This would suggest that certain Social Darwinist tenets were redundant in higher societies. While the Nazis veneratedHaeckel, it was on the basis of a very selective reading of his ideas. On the other hand, Haeckel was much appreciated for furthering materialism, by Lenin and by German socialists such as Walther Ulbricht. Although this was also a distortion, it gaveHaeckel an honoured place under communism. His evolutionary ethics interested a variety of thinkers, including Sigmund Freud, Magnus Hirschfeld (the campaigner for homosexual rights) and many authors and artists.

Hägerström, Axel Anders Theodor (1868-1939)

Hägerström was professor of philosophy at Uppsala University, Sweden, from 1911 until 1933, and together with his pupil Adolf Phalén founded the Uppsala school of conceptual analysis. He first came to the attention in 1902 with a study of Kant's ethics, but his main claim to fame rests upon the anti-metaphysical and emotivist positions which he developed during the years 1905-39. Thus the two fundamental theses of his moral philosophy are that moral valuations are neither true nor false, and that the proper task of moral philosophy itself is only descriptive and not normative. In this connection he argued that the philosophical ideas of objective moral values and of absolute rights have created fanaticism and sharpened conflicts in human history. He is also well known for his work in jurisprudence as the founder of Scandinavian legal realism. Here again his thought is predominantly antimetaphysical, and he criticized many legal concepts for their metaphysical and magical elements.

1 Kant research

Hägerström's *Kants Ethik* (1902) is in part an attempt to find a coherent line of thought in Kant's ethics. But the first part of the book is a penetrating analysis of Kant's epistemology in general. Hägerström sharply criticizes the prevalent psychologistic interpretation of Kant (such as that of Vaihinger) according to which the central line of thought in *The Critique of Pure Reason* is a psychological theory of the causes of human knowledge; according to Hägerström's logistic interpretation it should be understood instead as a logical analysis of the reasons of knowledge (see Kant, I.; Neo-Kantianism).

2 Ontology and epistemology

The motto of Hägerström's *Selbstdarstellung (Self-description)* (1929) is '*Praeterea censeo metaphysicam esse delendam*' (Besides, it is my opinion that metaphysics ought to be destroyed). According to Hägerström metaphysics rests on a deep misunderstanding of the concept of reality: in metaphysics, reality (the universal concept) is conceived as itself something real. This error is a result of a confusion that is natural to the human mind; it is implied by the common-sense conception of temporal and spatial facts; it is connected, Hägerström argues, with the idea that the past is unreal, an idea which belongs to common sense but which, like many other common-sense ideas, is absurd.

By an abstract argument Hägerström tries to show that the real world must be identical with the spatiotemporal continuum of experience. But the concept of reality is not derived from experience; on the contrary, it is a presupposition of all experience (and a presupposition of every judgment). This is one of the rationalistic ingredients of Hägerström's epistemology. Another important ingredient is the criticism of subjectivism, that is, of the idea that the only thing immediately given for a subject is that subject itself and its perceptions. Hägerström's picture of reality is strictly deterministic, the principle of causality being a logical condition of all empirical knowledge. He rejects the conventionalist opinion that the principle of causality is just a postulate stipulated by science; nor does he share Kant's opinion that it is a synthetic a priori judgment. He argues instead that it is deducible from the logical principle of the self-identity of reality.

3 Moral philosophy and theory of value

The main thesis of Hägerström's famous inaugural lecture of 1911, *Om moraliska föreställningars sanning (On the Truth of Moral Ideas)*, is that moral valuations are neither true nor false. Even such moral valuations as are usually expressed by declarative sentences lack the character of judgment; the value predicate is an expression of emotion, and in every valuation an emotion is a constituent element. Hägerström was one of the first philosophers to hold a no-truth-value theory about moral valuations, and one of the first to propose an emotive theory that did not take a moral valuation as a judgment about an emotion, but as itself constituted by an emotion. Emotive theories must explain the existence of abstract value sentences (such as 'Honesty is something good'), since emotions are evoked by particular phenomena such as individual actions or persons, not by universal concepts. Similarly, it is also a problem for an emotive theory to explain the existence of inferences having a value sentence as a premise, since emotions cannot enter into an inference. As early as the 1910s Hägerström was conscious of these and similar problems, and gave interesting solutions.

The moral valuations are the primary elements of morals, but in addition there are, in common types of morality,

important elements which, according to Hägerström, are false judgments. The idea of free will, which is absurd according to Hägerström's determinism, plays an enormous role in the history of morals, and so does the idea of objective values, which again is false. Several metaphysical ideas are false ingredients of many kinds of morals: for example, a metaphysical concept of person is presupposed by many deontological norms and in the doctrine of human dignity; a metaphysical assumption is also presupposed by the idea of absolute values. Hägerström gave a complex analysis of the idea of duty and found certain absurd conceptions involved in it. Thus Hägerström combined his emotive theory of the primary elements in morality with an error theory about other elements. Hägerström was influenced in certain ways by Meinong, Westermarck and Nietzsche, but on the whole his moral theory is an original achievement (see Emotivism; Morality and emotions).

4 Legal philosophy

According to Hägerström several of our fundamental legal concepts are metaphysical and magical, and hence absurd. An example is the concept of ownership: a person's ownership is an intermediary link between its legal ground (for instance, a gift or a purchase) and its legal consequences. This link cannot be identified with any empirical fact; it is a metaphysical entity, or, more precisely, a metaphysical force or power. Thus, the transfer of an ownership between persons is a transfer of a metaphysical force, that is, a magical procedure. (Hägerström's strong interest in the social and cultural role of magic was stimulated by Frazer's celebrated *The Golden Bough* (1911-15). Hägerström's view on the essence of magic was not identical with Frazer's, but he was much influenced by his scheme of classifications and by certain details in Frazer's work.)

Hägerström made a thorough and comprehensive inquiry into certain central themes of Roman law, paying great attention to its magical elements. He analysed the connection between Roman law and the doctrine of Natural law. He rejected this doctrine in all its forms, and urged that even many modern authors who explicitly disavow the principles of Natural law have nevertheless resorted to such ideas. He also rejected the will theory and Kelsen's pure theory of law (see Kelsen, H.). He was the founder of the school of Scandinavian legal realism, according to which it is a main task of legal science to give a description of legal phenomena in strictly empirical terms, without any metaphysical or ethical ingredients (see Legal realism).

5 Philosophy of religion

In his lectures of the 1920s, Hägerström developed a theory of religion which resembles, in an important respect, his theory of morality. The primary element in religion, as in morality, is something which is constituted by emotions, and which is neither true nor false. With this element, however, are combined false ideas of different kinds, and in religious dogmatics such false ideas are of essential importance (for example, the idea of God as an objective reality and the common conceptions of the effects of prayer or sacramental acts); an important factor in the formation of these ideas is the objectification of the contents of religious emotions.

Hägerström made thoroughgoing psychological investigations of these false religious ideas, of their relations to the emotive element, to morals and to magic. His psychological views about emotions and about self-consciousness are very complex, and this is especially evident in his philosophy of religion. He analysed both positive religion and metaphysical religiosity. In his treatment of positive religion, Hägerström utilized his great classical learning by taking examples from Greek and Roman religion, but he also referred to the religions of India, to primitive religion and, most often, to Christianity. An important detail is his investigation of the relation between magic and religion in the Lutheran doctrine of justification by faith; another, his analysis of different forms of the consciousness of sin. In his treatment of metaphysical religiosity he dealt with Plotinus, Eckhart, Spinoza and others, analysing how mysticism passes over into scholasticism and scholasticism into mysticism (see Mysticism, nature of).

Halakhah

The central ideal of rabbinic Judaism is that of living by the Torah, that is, God's teachings. These teachings are mediated by a detailed normative system called halakhah, *which might be translated as 'the Way'. The term 'rabbinic law' captures the form of* halakhic *discourse, but not its range. Appropriate sections of* halakhah *have indeed served as the law of Jewish communities for two millennia. But other sections relate to individual conscience and religious observance and are enforceable only by a 'heavenly court'.*

Although grounded in Scripture, halakhah*'s frame of reference is the 'oral Torah', a tradition of interpretation and argument culminating in the twenty volumes of the Talmud. God's authority is the foundational norm, but it is only invoked occasionally as superseding human understanding. Indeed, the rabbis disallowed divine interference in their deliberations, asserting, in keeping with Scripture, that Torah is 'not in heaven' (Bava Metzia 59b, citing Deuteronomy 30: 12).*

Given the lack of binding dogma in Judaism, halakhic *practice has often been regarded as the common denominator that unites the Jewish community. The enterprise of furnishing 'reasons of the commandments' (*ta'amei ha-mitzvot*), central to many thinkers in Judaism, accordingly reveals a great diversity of orientations. These range, in medieval Judaism, from esoteric mystical doctrines to Maimonides' rational and historical explanations; and among modern writers, from moral positivism to existentialism.*

1 Interpreting biblical law

Of the twenty-four books canonized in the Hebrew Bible, *halakhah* accords strictly binding status only to the norms recognized as having been promulgated in the five books of Moses, the Pentateuch. Revered as the document of God's revelation, these constitute Torah in its narrow sense, and are regarded as the core of Torah (instruction) in the broad sense, which encompasses all valid teachings in Judaism through to the present (see Bible, Hebrew).

The Pentateuch contains not only laws, but also their setting: the story of creation and of God's relationship with humankind in general and with the Israelite people in particular. This relationship is consummated in the Sinai Covenant, whose human partners become committed to God's commandments (*mitzvot*). Much of the Torah is indeed composed of laws, typically introduced by 'The Lord spoke to Moses'.

This divine legislation differs from familiar legal codes in both scope and form. Its scope extends to issues which in the modern West belong not to law but more typically to the realms of religious practice or personal morality. This broad scope is characteristic of *halakhah* throughout its history. Some contemporary scholars have therefore proposed to treat Jewish law as a subcategory of *halakhah* relating to those issues generally included in the realm of law. As to form, the legal passages in the Pentateuch hardly read as a coherent system of law. They contain many duplications, gaps and inconsistencies; and their texts are traced by Bible scholars to a variety of circles and periods between the times of Moses (thirteenth century BC) and the first exile (sixth century BC). While some of these biblical teachings undoubtedly embody ancient Israelite legal practices, others seem to enunciate utopian legislation, a prescriptive parallel to the social criticism of the post-Mosaic prophets.

Since all scriptural verses are, in the *halakhic* system, equally holy, the biblical heritage, from the outset, called for extensive interpretation and harmonization. For example, according to Exodus 21: 1-7, a fellow-Israelite bought as a slave must be set free at the seventh year; but if he formally refuses this option he remains a slave 'forever'. Leviticus 25: 39-43 restricts slavery in a rather different way: it makes no mention of a seventh-year release, but prohibits gruelling labour, and proclaims freedom for all Israelite slaves in the Jubilee year. Jeremiah 34: 8-16 suggests that neither legal scheme had the impact that the imperatives seem to expect. But the *halakhah* accepted both, offering a liberal harmonization: the slave could not be forced into gruelling labour, *and* was to be offered his freedom on the seventh year. Even if he chose servitude, 'forever' was interpreted as 'until the Jubilee'.

The Second Commonwealth (fifth century BC to first century AD) saw a great increase in reinterpretations and enhancements of Torah for diverse reasons, in particular among the 'Pharisees'. By contrast with their rivals, the Sadducees (the priestly party, who put primary emphasis upon the temple rituals), the Pharisees gave greater weight to personal spirituality. Inspired by biblical passages like Leviticus 19: 2 ('You shall be holy, for I the Lord

thy God am holy'), they sought to direct everyday life and behaviour towards an ideal of pervasive holiness. After the destruction of the Second Temple (70 AD), the Pharisees became, perforce, the preservers of Jewish norms and ideals. They and their heirs became known as 'the rabbis' (masters or teachers), and their work defines classical 'rabbinic Judaism', the socio-cultural context of *halakhah*.

2 Rabbinic Judaism: *halakhah*'s classical era

In the definitive work of early rabbinic Judaism, the Mishnah (compiled by Rabbi Judah the Prince in the Galilee, *c*.200 AD), some sections closely follow biblical law; others boldly modify it, not through outright rejection or explicit amendment, but through a mode of qualifications and reinterpretations, called midrash (exposition or explication) (see Midrash). The rabbis recognized the great disparity between rabbinic and biblical law, and emphasized that the 'written Torah' must be accompanied and complemented by the 'oral Torah'. Indeed, they came to describe the oral Torah as a historical concomitant of the written Torah and even claimed normative primacy for the oral law: 'God's covenant with Israel was in regard to the oral *torah*' (Gittin 60b) (see Theology, Rabbinic §5).

A fine example of rabbinic boldness is the Mishnah's treatment of capital punishment. Detailed codification of the many capital offences prescribed in biblical law is combined with a procedural policy explicitly aimed at making executions virtually impossible. The Mishnah's discussion of capital punishment concludes by citing Rabbi Akiba, widely considered the greatest of the rabbinic sages: 'Were [I] in the Sanhedrin [the High Court], no person would ever be put to death' (*Mishnah Makkot* 1: 7). The rabbinic policy expressed here reflects a pervasive religious humanism, harking back to the dictum of Genesis that humanity, and so each individual human being, is created in God's image.

The Mishnah faithfully preserves the record of disagreements among the rabbinic sages, but it typically omits mention of their argumentation and much more. Its condensed legal clauses became focal points for elaboration, explanation and enhancement. These afford much of the bulk of the Gemara, by which the Mishnah is expanded to form the Talmud. The Talmud seeks to leave no issue unexplained; indeed, its redactors seem committed to overexplanation, sometimes advancing three or four alternative answers to each of the questions it raises, or offering strings of arguments and counterarguments to render plausible each side of its myriad of debates. The Talmud's interest in reasons and ideas, rather than in mere legal pronouncements, is further reflected in the fact that perhaps a third of it consists of *aggadah*, that is, narrative material - stories and parables, expositions of the non-legal parts of the Bible, theological and moral homilies, and the like.

3 Post-Talmudic Judaism: decentralized *halakhah*

After the redaction of the Talmud (in Mesopotamia, *c*.500 AD - hence the name 'Babylonian Talmud', as distinct from the earlier and less influential 'Jerusalem Talmud'), Judaism saw a shift away from a single cultural centre. The commitment of Jewish communities throughout the diaspora to the *halakhah* canonized the Talmud with its complex dialectic form, where hardly any debate ends with an explicitly stated definitive conclusion. Practical rulings in moral, legal, and ritual matters of *halakhah* came to rest in the hands of local courts or individual rabbinic scholars, masters in the art of Talmudic interpretation. Jewish communities had a considerable measure of legal autonomy as tolerated minorities, and through their various internal processes endowed such courts and scholars with *halakhic* authority.

This reality fit well with the classical rabbinic application of the dictum of Deuteronomy that the Torah is 'not in heaven': God's will is to be determined not by prophecy or oracles but by study and interpretation. Thus, despite the system's ultimate grounding in revelation, post-Talmudic Halakhists rarely appeal to Scripture - let alone to revelation - in arguing or deciding points of *halakhah*. Instead, they focus on the oral Torah, God's word as mediated by tradition, precedent and practical reason (*sevara*). When Moses Maimonides sought to offer, in his monumental *Mishneh Torah*, a univocal codification of Talmudic law, his code was widely respected but not accepted as final or binding. One central criticism was that he had written 'like a prophet', failing to support his rulings or to quote and engage alternative opinions and interpretations. Despite the recognized usefulness of Maimonides' code, and others as well, then, the most important repository of *halakhic* sources from medieval and early modern times was and remains the Responsa literature: wide ranging and unsystematic collections of reasoned rulings, resembling court opinions, issued by eminent scholars in response to written queries.

4 Contemporary *halakhah*

Halakhic authority reached a watershed with the political changes of the eighteenth and nineteenth centuries, which greatly undermined the jurisdiction of *halakhic* courts. For Orthodox Jews, *halakhah* continues to function as a system of religious law: through contemporary Responsa, essays and monographs, it addresses a broad spectrum of issues in modern life. Conservative, Reform, Reconstructionist, and many other Jews relate in their own ways to *halakhah* as a less binding framework, which nevertheless informs their normative thinking. In the state of Israel, *halakhic* courts have limited jurisdiction, primarily in matters of personal and family law. The contemporary Jewish scene thus reflects an unprecedented diversity of perspectives regarding *halakhic* concepts and norms.

For example, an issue of major contention concerns defining the Jewish community itself. In rabbinic Judaism, joining the community from without was perceived as a transformation of religious identity. The national and religious communities were one and the same, and the convert joined the Jewish people through a ritual defined by religious law. In the modern setting, however, many Jews (both in Israel and in the diaspora) see themselves as members in a national or ethnic collectivity rather than as adherents of a religion. While the Orthodox continue to require ritual immersion for those who wish to become Jewish, and (for males) circumcision, accompanied by (at least an overt) commitment to *halakhah*, and overseen by a rabbinic court of three men, other circles, drawing on Talmudic sources, have adopted alternative criteria and procedures.

5 Philosophies of *halakhah*

Philosophical discourse on the *halakhah* has traditionally focused on two main problems: rationality and coherence.

The rationality of *halakhah* is problematic in light of the numerous details, mainly in ritual law, which may seem alien to the dictates of reason. The rabbis were prepared to grant, on occasion, that particular commandments were ‘divine decrees’, unfathomable demands of the divine Sovereign. But to medieval religious philosophers, who had come to share Aristotelian traditions, a much greater segment of *halakhah* appeared hard to justify. Starting with Saadiah Gaon al-Fayyumi, some offered a distinction between ‘commandments of reason’ and ‘commandments of obedience’; even the latter, however, were in principle justifiable - for example, by the value (intrinsic or instrumental) of obedience itself.

The second issue in the philosophy of *halakhah* relates to the system’s formal coherence, rather than to the substance and sense of its particular elements. The rabbinic idea of norms grounded in God’s revealed words, but subject to extensive midrashic remoulding, seems to pose a fundamental paradox: If the autonomy of human reasoning is upheld against the divine author’s intention, has not the commitment to revelation become insincere? This challenge was posed most poignantly by the Karaites, a powerful movement in medieval Judaism radically opposed to midrash and to the entire project of an oral law (see Karaism).

Rabbinic responses in this case diverge into two different tracks. Some play down the scope of innovation in *halakhah*, insisting that the entire oral law was revealed at Sinai. Others seek to distinguish between an unchanging core of divine law and a supple, growing body of human teachings.

Some views of Judaism emphasize elements outside of *halakhah*; they may contain a philosophy of *halakhah* but do not make it their main subject. This is true of Maimonides’ philosophy, as presented in his *Guide to the Perplexed*, which views the entirety of the divine law as a means to an end, the attainment of human perfection through the realization of the inner human propensity to become Godlike. It is equally true of various systems of Jewish mysticism (see Kabbalah). In their different ways, both rationalists of the Maimonidean persuasion and mystics of Kabbalistic inclination have seen intimate knowledge of God as the focus of religious life and have gauged the import of *halakhah* from that standpoint. The work of Franz Rosenzweig represents a modern counterpart to such approaches.

Halevi, Judah (before 1075-1141)

Physician, philosopher and perhaps the greatest Hebrew poet since the Psalms, Judah Halevi studied the Neoplatonic Aristotelianism widespread in Islamic Spain, but his loyalty to Judaic traditions, love of Israel and poetic empathy for the sufferings and aspirations of his people made him a powerful critic of that philosophical tradition. His philosophical masterpiece, the Kuzari, is a fictional dialogue set at the court of the king of the Khazars, a people of the Volga basin whose leaders had converted to Judaism in the early ninth century. Reports of the Khazar realm sparked Halevi's imagination and gave him the backdrop for this effort to celebrate and shape his ancestral faith.

Beyond heartening his fellow Jews in times of upheaval, Halevi confronted philosophical questions that conventional thinkers often begged or ignored. He found the erudite Neoplatonism of his day too confining to God, too speculative and a priori. Tellingly, he condemns Neoplatonism for cultural vacuity, moral sterility and spiritual escapism: while Christians and Muslims, with the highest spiritual intentions, earnestly set about one another's murder, the philosophers fail to differentiate one faith from another. What is needed, Halevi reasons, is not a still more spiritual intellectualism but a historically and geographically rooted tradition concretely directed by God's love.

Halevi did not, as romantics often suppose, simply turn his back on reason, or on philosophy generically. Rather, he used his own philosophical gifts and poetic tact to retune philosophy to the ground notes of Jewish experience. He retained but structurally adapted the Neoplatonic linkage of God to the world via emanation, replacing the elaborate hierarchy of star souls with the simple manifestation of God's word, the 'Amr. *Like Philo's* Logos, *Halevi's* 'Amr *was at once an attribute of God, his wisdom and a manifestation of God immanent in nature. Since the* 'Amr *is an imperative, it connotes power, volition and command, not just logical entailment or necessitation. Since it is immanent, it allows fuller appropriation than was possible for many philosophers and many of the pietists and mystics in their wake, of the material side of nature, including human nature: language, material culture - including agriculture and other economic activities - law and politics belong to realm of God's expression. Particularity is not isolated from God. Poetry and works of imagination can be expressions of the divine, not just stepchildren mediating the ever more abstract and abtruse flights of the intellect. Zion could be acknowledged as the land where the divine afflatus was most clearly articulated as a way of life. Longing for Zion need no longer be sublimated in prayer; rather, Israel's songs of longing for the robust life of the land of God's grace would voice a spiritual imperative that demanded practical expression and historical realization.*

1 Life

Born in Toledo and broadly educated in Arabic and Hebrew letters and sciences, Judah Halevi became a physician and poet in the Spain of the early Reconquista period. His poems speak of love, wine, gardens, friendship and the death of friends, of spiritual quest, devotion and the love of God, his Hebrew reluctantly attuned to Arabizing rhymes and cadences; but the ruined campsite that once prompted elegies to lost loves in pre-Islamic odes, is now the ruined Temple mount. Alienation gives edge to Halevi's poetry and thought. Philosophy, as he finds it, shows deep rifts between ideals and practice. Medicine is wanting both technically and spiritually. The Christian rulers of Northern Spain seem inhuman taskmasters, with the Jews their ministering slaves: 'we heal Babel, but it will not be healed' (letter to David Narboni, in *Diwan*, Brody 1974: 224).

Leaving Castile and settling in Cordova, Halevi saw the streams of Jewish refugees who fled the Almoravids and the Christian plundering and destruction of Jewish towns, and he learned of the terrors of the First Crusade. 'How can I savour what I eat', he wrote, 'when Zion is in Christian chains, and I in the shackle of Islam?' ('Libbi be-Mizrah', in *Diwan*, Brody 1974: 2). The smouldering scenes of a medieval Guernica, etched in his verses, made Halevi a proto-Zionist. Moving between Christian and Muslim Spain, protected by Jewish courtiers who prized his poetic and medical skills, Halevi saw no respite for his people.

Restless and troubled, he longed for Zion: 'My heart is in the East, but I am in the farthest West' ('Libbi be-Mizrah', in *Diwan*, Brody 1974: 2). The East here was more than geographical. The very direction held a spiritual significance for Halevi, conveyed in ideas of light, life and enlightenment. But could the East even in that sense exclude the earthly land of Israel, the land where the people of Israel had lived their earliest history and

fullest life as a nation? Could even the spiritual East be less than Zion? How could one mourn the lost Jerusalem and pray for its restoration, yet remain in exile? Friends might urge complaisance, but as Halevi's historic vision deepened and darkened, his friends seemed drunk. Casting them in the stock role of the 'reproacher' of Arabic love lyrics, he turned on them: 'Is it good for a pure and honest man to be led about like a captive bird in the hands of children?' Halevi expanded on such questions in his *Kuzari*, an Arabic philosophical dialogue (the full title of the work is *Kitab al-radd wa 'l-dalil fi 'l-din al-dhalil (A Defence and an Argument on behalf of the Abased Religion)*.)

2 The *Kuzari*: the basis of commitment

Written between 1130 and 1140, the *Kuzari* reflects a striking episode of Jewish history. In the early ninth century, Bulan, King of the Khazars, a people of the Volga basin, along with four thousand of his nobles, had adopted Judaism. Under Byzantine and Muslim pressure, the king sought his own monotheistic faith. Granted religious freedom, most Khazars probably never became Jews; but until the Khazars were swept away in the Tatar invasion of 1237, Judaism was the state religion. Hasdai ibn Shaprut, *wazir* of 'Abdu 'l-Rahman III of Cordova, thrilled to hear of a powerful Jewish state in the East, wrote to the Khazar monarch around 960. Replying, King Joseph told of the Khazar conversion and described his kingdom.

The conversion had followed a debate among Christian, Jewish and Muslim spokesmen, which Halevi fictively reconstructed. The king has dreamt that his intentions, but not his practices, are pleasing to God. He consults a philosopher but hears only a disappointingly intellectualist Neoplatonic Aristotelianism. 'If philosophers say that God created you, that is metaphorical, of course. For He is the Cause of all the causes that conspire in the creation of all things' (*Kuzari* 1.1).

The philosopher argues smoothly, with many therefores and an almost equally smooth stream of disembodied intellects through which God's act reaches the world: 'The world is eternal. Human beings have always arisen one from another, their forms compounded and their characters formed by those of their fathers and mothers, and by their environment - airs, lands, foods and waters - along with the influences of the spheres, constellations and signs of the Zodiac' (*Kuzari* 1.1). Man's goal is to purify the soul, for the perfect may reunite with the nearest hypostasis, the 'active intellect' - which the perfect man, ignoring mere limbs and organs, already is. Religion is a valuable moral conditioner, especially for the masses. Once its function is grasped, however, it may be moulded at will.

The king finds the philosopher's argument 'impressive', but unhelpful. He still seeks a way of life pleasing to God. Christians and Muslims divide the world; with the highest intentions, they earnestly pursue one another's murder. Philosophy seems to wish to stand above the fray, deeming all monotheists to be truth seekers. But how can these enemies all be right? The philosopher's affirmation, 'In the faith of the Philosophers there is no such killing, since we foster the mind' (*Kuzari* 1.1), betrays a stunning innocence. The highest intentions, it seems, do not differentiate acts of heroism from obscene atrocities. Ethos is grotesquely under-determined by ideology. *Khalas* (sincerity) must be given a material, not merely formal sense; devotion must extend to action, not just in cultivating personal virtues but communally. Neoplatonists, pietists and ascetics still must address the embodiment of their ideals and the delicate, dangerous nexus between ethos and ethnicity. The philosophers have paid too little mind to history.

The king grows curious about Christians and Muslims: 'Surely one of these two ways of life is the pleasing one' (*Kuzari* 1.1). The obvious abasement of the Jews seems to exclude theirs. A Christian and a Muslim speak, appealing, respectively, to the divinity of Christ and the inimitable language of the Qur'an. The king's responses vividly signal Halevi's outlook: a little philosophy would not hurt the Christian case. 'Not having grown up in these beliefs', the king feels no need to seek credibility for them. Logic will accommodate experience, but that is because experience takes root in the heart (*Kuzari* 1.5).

Like Muhammad, the Muslim spokesman avoids appeal to miracles, except the Qur'an, whose every verse Muslims call a portent. Again the Khazar answers existentially:

> If one hopes for guidance from God's Word and hopes to be convinced, against his own scepticism, that God does speak to mortals, things ought to be manifest and incontrovertible. Even then one would hardly credit that God spoke to a man. If your book is miraculous, being written in Arabic its uniqueness and inimitability are

> indiscernible to a non-Arab like me. When read to me, it sounds like any other Arabic book.
>
> (*Kuzari* 1.6)

Since both Christian and Muslim cite Jewish history, the Khazar summons a rabbi, called a *Haver* or Fellow of a Talmudical academy. The rabbi opens not with a cosmological credo but an invocation of the God of Abraham, Isaac and Jacob. He avoids proofs like the design argument:

> 'If you were told that the ruler of India was a virtuous man whom you should hold in awe and whose name you should revere, but his works were described to you in reports of the justice, good character and fair ways of the people of his land, would that bind you to him?'
>
> 'How could it, when the question remains whether the people of India act justly of their own accord and have no king at all, whether they do so on account of their king, or whether both are true?'
>
> (*Kuzari* 1.19-20)

Mere argument does not show whether the order and design of nature are the work of God, intrinsic to nature, or Neoplatonically imparted by God through the natures of things:

> 'But if a messenger came to you from that king with Indic gifts, that you were certain could be had only in India, and only in the palace of a king, and he brought you a written attestation that these came from the king, and enclosed medicines to treat your illnesses and preserve your health… would this not bind you to his allegiance?'
>
> (*Kuzari* 1.21)

Similarly, God confronts Pharaoh (Exodus 5: 1) not as the creator but as the ancestral help of Israel; at Sinai (Exodus 20: 2), he is the God who saved Israel from Egypt. What mattered then was not what God had done for the universe, but what he had done for them. Only Israel, the Rabbi argues, has a true and continuous tradition regarding the divine. India may be ancient, but its people have no coherent system of ideas, and they are polytheists. Greek philosophical originality is a *tour de force*, but it shows the unsteady gait of solecism. Aristotle has no tradition to keep him from going overboard, as when he ascribes intelligence to nature at large.

The religion of Israel, the *Haver* argues, uniquely combines the intimacy of God's unique historical relationship with Israel and the publicity of the entire nation's experience of God's act, receipt of his gifts and their written attestation, passed down undisrupted through the generations, preserving the certitude of God's ancient self-revelation. The true religion did not evolve like man-made faiths. Like creation, it was complete in a moment, when 600,000 Israelites experienced their redemption, and after wandering in the desert, somehow heard God's words, each individual directly and personally inspired.

Reacting to the palpable chauvinism (*ta'assub*) of the *Haver*'s claims, the king asks if the sin of the Golden Calf does not diminish the rabbi's all but insufferable pride. Every nation, the *Haver* replies, was full of idolaters at the time. Any philosophers who could prove that God was one would still have rationalized idolatry as symbolism mediating the divine to the masses. Israel's backsliding was grievous principally because the sin was theirs. The people sinned, but they were forgiven. What matters is that they were chosen. They preserved the perfection in which Adam was created. The perfect climate of the God-given land would prepare them to live by God's word. Prophecy will never leave them.

Israel's great gift is not the specious reward of a sensuous afterlife, or even a spiritual afterlife that no one really wants, but the abiding presence of the divine in this life. Philosophers imagine that only pure intellects are immortal; Muslims and Christians compound such exclusivism with superstitious notions that lipservice somehow confers immortality. But Jews believe that God rewards the righteous of all nations. What distinguishes Israel lies in this world. Jews do not spend their lives begging their king for safe conduct on the parlous journey that every mortal must undertake; they live confident that God, by whose word they live, will not forsake them.

Convinced that here must be the way of life his dream foretold, king and *wazir* embrace Judaism and gradually win over many of their nation. They study the Torah and gain great worldly success, honoring the Israelites among them as the first and most fully Jewish of their countrymen. Only after extensive study of the Torah does the king begin to inquire speculatively into its theology; existential commitment comes first.

3 The *Kuzari*: idea and embodiment

Through the dialogue, Halevi proposes that God is described in three ways: (1) negative predicates, indicative of perfection, as when we say ‘the living God,’ to distinguish him from the dead, false gods of idolaters; (2) relative predicates, expressing human attitudes toward God, as when we call him blessed and exalted; and (3) predicates of creativity, which speak of God’s acts through some natural medium or agency, as when we say, ‘making poor and rich’ God’s agency in nature is his will, the motive force behind all natural and supernatural events, and the source of the created glory that manifests God’s grace on Israel in their land, the favoured place for its appearance. When Israel dwells on its soil in peace and justice, prophecy becomes possible among the pious. All true prophecy was either in or for the land of Israel, the centre of the globe and reference point of day and night, east and west. Its very air imparts wisdom. Thus the sages were not misled in saying that one who walks four yards there is assured of happiness in the world to come: such a person already tastes transcendence.

Surely then, the king responds, the rabbi is remiss in not returning to that land. For even if the Shechinah, God’s immanence, is no longer present there, one should seek to purify the soul in such a holy place, if only because it once was there. The rabbi accepts the reproach, answering only that Israel’s return has always depended on the people’s willingness, for ‘God’s Word grants a man no more than he is capable of receiving’ (*Kuzari* 2.24). Israel today is no longer a body but only dry bones. Yet these bones preserve a trace of life, which can return to them if the Temple, which animated them, and made them vulnerable, is restored.

Adapting a thought that Plato had applied to philosophers, the Rabbi says that Israel is the heart among the nations, at once the most vital and the most vulnerable. Prophecy will return, but prophets and saints are not the same as hermits and ascetics. Mere renunciation does not achieve the intimacy with God that makes a nation the true seedbed of prophecy. Justice, not humility or spirituality, is the natural, rational and necessary foundation of a nation’s life: ‘The divine law cannot be fulfilled until the civil and rational laws are perfected.’ Israel cannot survive and fulfil God’s commandments as a soul without a body. Not withdrawal and asceticism are demanded but the full life of an economy and a state. It is as much a divine commandment to labour and cultivate the soil as it is to keep the Sabbath, for both celebrate God’s act of creation and the liberation of Israel from Egypt.

Piety is not best shown by upturned eyes, meditative postures and gestures, or fine words that intend no action, but by genuine commitment and sincere intentions, manifested in demanding actions performed with dedication. What Halevi calls for here is not simply a return to Zion; not mere spiritual longing, but the reconstitution of the full, robust life of Israel in its land, under its laws. The members of the Sanhedrin, he argues, were responsible for knowledge of every science: the authentic sciences, to fulfill the intentions of the Law and preserve the health and welfare of the people; the conventional sciences, to perfect their use of language; and even the specious sciences, evidently to understand ambient superstitions. These sciences, whose relics still distinguish Jews, must be restored, along with the Hebrew language, which has fallen into decline since the days of the psalmists and has become the toy of lackeys and misfits.

Israel’s aim is not otherworldliness. We love life and all its goods. True, a man who reaches moral perfection, like Enoch or Elijah, will grow uncomfortable in the world and will feel no isolation in solitude. Yet today, when there is no clear vision, the good man must be the guardian of his country. He must give all his powers their due, preparing them to serve when called on. The king is surprised at so political an idea of personal goodness, but the rabbi replies that human goodness is political for Plato’s reason, that it rests on command over one’s powers: ‘The good man is the prince, obeyed by his senses, and by his spiritual and physical powers…. It is he who is fit to rule. For if he led a state, he would apply the same justice in it as he does in governing his own body and soul’ (*Kuzari* 3.5).

Human rationality regulates the good man’s life. However, God adds further refinements to the life of Israel, rendering specific the generic obligations of reason, and instituting the visible symbolisms that save the idea of a covenant with God from reduction to a mere abstraction. The good Israelite lives in the thought that God is ever-present; the world is not finished or abandoned but an ongoing creation, in which our own words and the songs that spring from our mouths at God’s behest issue without our least knowledge of how the God-given powers of the body and creativity of the mind spring to his service.

Obedience, not zeal, is God’s desire. Moderation, not excess, anchors God’s plan. Just as only God, and no mere

alchemist, knows the proportions needed to compound a living body, so no mere tinkerer can fashion a law of life. No individual can possibly replace the careful, systemic modulation of the good life. Halevi's target here is the Karaites, whose rejection of oral or Talmudic Law seemed to leave each individual to comprehend the Torah in isolation (see Karaism). Without an oral tradition, we would not even know how to vocalize or parse the text, let alone govern by it. True, the Karaites show originality, the product of their isolation. They are like foot soldiers in no man's land; the Rabbanites, secure in their traditions, seem as confident and lax as the populace of a walled city. But on Karaite principles, there would be as many codes as opinions.

The Oral Law is stricter than the Law of Moses, making a margin (*seyag*) around the Torah, but that allows the Rabbis to qualify and mitigate their rulings, guided by God's still present Word. We are not confined to the flickering light of reason but know God through our intercourse with him and the long history of our growing awareness, traceable in a tradition recorded by Scripture all the way back to Adam.

God's will is executed in nature without intermediaries, the *Haver* argues, with a sidelong glance at the Neoplatonic cosmos, clogged with disembodied intelligences. Like other critics, including al-Ghazali, Halevi finds the idea that emanation is the truth behind scriptural creation reductionistic. It treats God's creativity too much as a mechanism or a necessity of logic, placing God at a remove and setting the ideas of things between God and his creatures. Knowing that his battle is with intellectual authority, Halevi turns satirical, asking how it is that thought in disembodied intellects generates a sphere. When Aristotle reflected, no such sphere arose!

Dispensing with the entire complex disembodied apparatus, Halevi ascribes God's knowledge and governance of the world directly to his Word, preserving the double edged efficacy of the ancient Philonic Logos: immanent in nature yet in no way separate from God, since it is His will. The *'Amr* or divine word of command is still, in a way, an emanation. For it does convey the divine idea and impress it upon the world, the Land and the prophets, who are recipients of inspiration. But the emergence of the Word from God in Halevi, like the initial differentiation of the First Essence in Ibn Gabirol, is now volitional. The work of emanation is no longer conceived through a mystification of logic that makes entailment somehow a source or vehicle of creation. The impact is to immanentize divine volition. This approach has a long afterlife: in Maimonides' theory of angels as forms and forces, in Kabbalistic developments pioneered by Nahmanides, in Spinoza's *conatus*, Bergson's *élan vital*, Whitehead's creativity and beyond.

In dismissing intellectualist emanation, Halevi has not rejected logic or philosophy; he has rejected the specific product that prominent philosophers ascribed to logic. Only tradition can explain their reliance on arguments as suppositious as those behind the Neoplatonic ontology. However, Halevi faults the philosophers not for their logic but for their want of logic. The naturalism to which Halevi appeals in rejecting the idea that mere self-reflection or contemplation of the divine can entail spheres or angels into being is philosophic, although it is corrosive to the intellectualist assumptions of the prevalent philosophical school of his day.

Philosophers may say that love of God follows from knowledge of his omnipotence, but such inferences are too abstract to command the heart. Similarly, even the most impressive arguments of the philosophers find no following among the common people, not because the people are too crude, as the philosophers suppose, but because the philosophers are too far removed from life. Humans need language, images and rituals. What we need to know of theology is that the world is created, that it has a cause in God, who is eternal and unconditioned, incorporeal, omniscient and omnipotent, living and willing eternally, and that the human will, like God's, is free. Volition is delegated to human beings, just as natural dispositions are imparted to all things. For if an external determinism were true, 'a man's speaking would be compulsory, like his pulse' (*Kuzari* 5.20).

The *Haver* draws his teaching to a close with new thoughts of Zion, which has never been far from the aim of his argument. The life of Israel in her land and the will of God are of a piece. The rabbi dismisses the pious notion that Israel's sins debar return. The liturgical confession 'and for our sins were we exiled from our land' is hortatory and admonitory, not explanatory or normative. The Psalmist's lines (102: 14-15) 'Thou wilt arise and take pity on Zion, for the time to favour her is here, the time is come - since Thy servants delight in her stones and cherish her dust', mean that Jerusalem will be rebuilt when Israel so yearns for it as to cherish her very stones and dust. The gloss sums up the hearty rootedness that Halevi opposes to Neoplatonic intellectualism and pietist asceticism. Responding, the king offers a courtly opportunity for his teacher to take his leave: 'If this be so, it would be culpable to detain you' (*Kuzari* 5.28).

Acting on the same conclusion, Halevi left Spain in 1140, travelling to Egypt and on to Palestine. In legend, he lived to kiss the ground outside Jerusalem, where, as he spoke the words of his Ode to Zion, he was killed by an Arab horseman. But the meaning of his journey is best captured in the direction he took, encoded not in the poet's life but in his work and above all in the *Kuzari*, with its intellectually serious call for the reintegration of Israel, body and spirit, land, language and Logos, the freely imparted and freely chosen direction of God's eternal Idea.

Hamann, Johann Georg (1730-88)

Hamann was one of the most important critics of the German Enlightenment or Aufklärung. *He attacked the* Aufklärung *chiefly because it gave reason undue authority over faith. It misunderstood faith, which consists in an immediate personal experience, inaccessible to reason. The main fallacy of the* Aufklärung *was hypostasis, the reification of ideas, the artificial abstraction of reason from its social and historical context. Hamann stressed the social and historical dimension of reason, that it must be embodied in society, history and language. He also emphasized the pivotal role of language in the development of reason. The instrument and criterion of reason was language, whose only sanction was tradition and use.*

Hamann was a sharp critic of Kant, whose philosophy exemplified all the sins of the Aufklärung. *Hamann attacked the critical philosophy for its purification of reason from experience, language and tradition. He also strongly objected to all its dualisms, which seemed arbitrary and artificial. The task of philosophy was to unify all the various functions of the mind, seeing reason, will and feeling as an indivisible whole.*

Although he was original and unorthodox, Hamann's critique of reason should be placed within the tradition of Protestant nominalism. Hamann saw himself as a defender of Luther, whose reputation was on the wane in late eighteenth-century Germany.

Hamann was also a founder of the Sturm und Drang*, the late eighteenth-century literary movement which celebrated personal freedom and revolt. His aesthetics defended creative genius and the metaphysical powers of art. It marked a sharp break with the rationalism of the classical tradition and the empiricism of late eighteenth-century aesthetics.*

Hamann was a seminal influence upon Herder, Goethe, Jacobi, Friedrich Schlegel and Kierkegaard.

1 Critique of reason

Born into a middle class family, Hamann spent almost all of his life in Königsberg, Prussia. He formulated many of his ideas in exchanges with his friend and neighbour, Immanuel Kant. From 1762 to 1764 he was the tutor of Johann Herder, who was profoundly influenced by him. For most of his life Hamann was a minor official in the Prussian bureaucracy, a position procured for him by Kant. Because of his mysticism and sibylline style he earned the sobriquet 'The Magus of the North'.

The starting point of Hamann's philosophy was his mystical experience and conversion, which took place in London in March 1758. Hamann went through a deep personal crisis that shattered his earlier allegiance to the *Aufklärung*. The solution to his crisis was a mystical experience, a rebirth through faith in Christ. During his experience Hamann had a vision of the divine omnipresence, of God dwelling within him and speaking to him through all the events of nature and history. The creation was the secret language of God, the symbolism by which he communicated his message of redemption to human beings. All of nature consisted in hieroglyphs, secret symbols and puzzles, which could be interpreted through Scriptures alone. Hamann wrote down his experiences and reflections upon them in several early manuscripts, *Biblische Betrachtungen (Scriptural Meditations), Brocken (Fragments), Gedanken ueber meinen Lebenslauf (Thoughts on My Life's Path)*, and *Gedanken ueber Kirchenliedern (Thoughts on Hymns)*, which were all composed from March to May, 1758. Although it was deeply personal, Hamann's vision had its roots in a commonplace of the pietist tradition: that all the events portrayed in the Bible are a spiritual allegory, a metaphor for the soul's struggle for salvation (see Pietism).

Hamann's reaction to the *Aufklärung* began with his defence of his new faith, which he set forth in his short tract *Sokratische Denkwürdigkeiten (Socratic Memorabilia)* (1759). This work was dedicated to Christoph Berens, Hamann's employer, and Immanuel Kant, who attempted to reconvert him to the cause of the *Aufklärung*. Its central thesis is that reason does not have the power to criticize faith. The jurisdiction of reason, Hamann argues, is limited to the assessment of the truth-value of propositions. Its task is to determine whether we have sufficient evidence for some statement. Faith therefore falls outside the sphere of reason, because faith consists in a living experience, which cannot be expressed in any proposition or statement. Just as reason cannot criticize our ordinary sensations, whose qualities are just given and indescribable, so it cannot detract from a mystical experience, whose qualities are no less present and ineffable.

In his defence of faith Hamann appealed to the scepticism of David Hume. According to Hamann, the Scottish philosopher had shown that reason cannot demonstrate or refute the existence of anything, and that we need faith to sustain us even in our ordinary life. Contrary to Hume's intentions, though, Hamann used his scepticism to *defend* religious belief itself. If reason cannot prove or disprove the existence of ordinary things, then *a fortiori* it cannot prove or disprove the existence of God. If we need faith in ordinary life, then why cannot we have it in religion too? In general, Hamann proved to be an important transmitter of Hume's ideas in Germany. His July 1759 letter to Kant refers to Hume, providing Kant with his first knowledge of the philosopher who would later awaken him from his 'dogmatic slumber'.

In many of his later writings - especially his *Kreuzzüge des Philologen (Crusades of the Philologist)* (1762) *Philologische Einfälle und Zweifel (Philological Whimsys and Doubt)* (1772) and *Metakritik ueber den Purismus der Vernunft (Metacritique of the Purism of Reason)* (1781) - Hamann deepened and broadened his attack upon the faith in reason of the *Aufklärung*. The chief target of Hamann's critique was the tendency of the *Aufklärung* to abstract reason from its social, historical and linguistic context. The *Aufklärer* treated reason as if it were a selfsufficient, autonomous faculty, operating independently of political interests, cultural traditions or subconscious desires. If, however, we are to avoid hypostasis, then we must raise the questions 'Where is reason?', 'In what particular things does it exist?' We can answer these questions, Hamann argues, only by identifying the embodiment or manifestation of reason in language, custom and action. Reason then proves to be not a special kind of faculty existing in some Platonic or noumenal realm but only a specific manner of speaking, writing and acting in concrete cultural circumstances. Accordingly, Hamann stressed the social and cultural dimension of reason, which had been much neglected in the eighteenth century. In this regard his teaching was influential upon Herder and anticipates the historicism of the nineteenth century.

When Kant's *Critique of Pure Reason* appeared in 1781, Hamann attacked it as a perfect example of the *Aufklärung*'s hypostasis of reason. The main fallacy of the *Critique*, as he described it, is 'the purism of pure reason', the abstraction of reason from its embodiment in language, tradition and experience. According to Hamann, Kant hypostasized reason by postulating a selfsufficient noumenal realm that exists apart from the phenomenal realms of language, history and experience. Kant commits a threefold hypostasis or purification of reason. He abstracts it from sense perception, tradition or custom, and - worst of all - language. What remains after all this abstraction is nothing but the purely formal transcendental subject =X, 'the talisman and rosary of a transcendental superstition which believes in all *ens rationis*'. In general, Hamann deplored Kant's dualisms in all their forms -noumena/phenomena, understanding/sensibility, concept/intuition - since they were nothing more than arbitrary and artificial abstractions. The central task of the philosophy of mind, in his view, is not to divide but to unite the various powers, showing how they stem from a single source. This single source, Hamann suggested, lay in words, the embodiment of thought in sensible marks and sounds. The central task for the critique of reason therefore lay in the examination and criticism of language itself.

Although Hamann's critique of reason made him a rebel against the prevailing ideology of the *Aufklärung*, it was not entirely new or original. To say that Hamann is without any known debt to anyone else is to ignore his broader intellectual context. Hamann's critique of reason should be placed firmly within the Protestant tradition, which had always insisted upon a sharp distinction between realms of faith and reason. It was Hamann's aim to defend this distinction, the integrity of the sphere of faith, against the incursions of the *Aufklärung*. His critique of hypostasis, his emphasis upon concrete experience, his insistence upon the linguistic embodiment of reason, and his claim that language consists only in convention and custom, all show his debt to the nominalism so characteristic of the Protestant tradition. It is indeed important that Hamann saw himself as the defender of Luther, whose reputation had waned at the close of the eighteenth century. Although Hamann's critique of reason moves within the broad contours of the Protestant tradition, it would be a mistake to regard him as an orthodox Lutheran or typical pietist. In the famous dispute between Lessing and Goeze, Hamann refused to side with the orthodox pastor, who had defended the literal truth of the Bible. Hamann's ultimate authority was mystical experience more than the Bible, which required a more metaphoric and spiritual interpretation. It is more accurate to place Hamann within the spiritualist tradition of Protestantism, among such radical reformers as Gottfried Arnold, Valentin Weigel, Jakob Boehme, Hans Denck and Sebastian Franck. Like Hamann, these thinkers stressed the importance of personal freedom and mystical experience.

It would be a mistake, too, to describe Hamann's critique of reason as a form of 'irrationalism', as if he were

strongly prejudiced against reason and the sciences. Hamann frequently insisted that his critique was directed against only the *illegitimate extension* of reason beyond experience, and that reason had a perfectly valid use within the boundaries of ordinary experience. If we use the term 'irrationalism' strictly and accurately, then it applies to the acceptance of beliefs that are contrary to evidence, the attitude typified by Tertullian's famous maxim *credo quia absurdam* (I believe because it is absurd). But Hamann rejected any such 'leap of faith'. In this regard he was only keeping with the traditional Lutheran distinction between the heavenly and earthly realms, where the supernatural heavenly realm was the object of faith, the empirical earthly realm the domain of reason.

2 Philosophy of language

The most important aspect of Hamann's critique of reason was his philosophy of language, which he first sketched in his *Kreuzzüge* and then developed in many writings throughout his life. Hamann is one of the first thinkers in the modern tradition to stress the importance of language for thought. He denies the prevalent eighteenth-century view - common to both the empiricist and rationalist traditions - that there are clear and distinct ideas apart from their embodiment in language. Words are not just arbitrary signs for already formed ideas but the very medium by which ideas come into existence. Thinking is nothing more than the use of symbols. To talk about ideas or concepts apart from words is again to lapse into that old fallacy of the *Aufklärung*: hypostasis.

Hamann takes a very radical stand on the connection between ideas and signs, thoughts and words. It is not only that signs are the *medium of existence* of reason; they are also the *criterion of its truth*. True to the nominalism of the Protestant tradition, Hamann denies that a proposition is true because it corresponds to some special kind of entity, such as facts, universals or states of affairs. All that exists are particulars, which can be explained and classified in all kinds of ways, depending upon our interests. The main criterion for truth is only the correct use of language, which is determined by nothing more than convention and tradition. In making language the criterion of reason and use the sanction of language, Hamann flirted with relativism, though he never explicitly avowed it.

In 1772 Hamann became involved in the famous eighteenth-century controversy regarding the origin of language (see Herder, J. §3). This debate, launched by Condillac in 1746, concerned whether language had a merely human or a divine origin. Hamann criticized his erstwhile pupil, Herder, for his view that the origin of language could be explained purely naturalistically, as a product of human need and skill. Although Hamann is generally regarded as a defender of the divine origin view, his theory is much more complex and obscure. On at least one reading, Hamann does not deny that the origin of language can be explained naturalistically. Rather, he holds that language has *both* a divine and human, a supernatural *and* natural, source. Although language is created through natural means, by the use of native human powers, God is also coactive in the use of these powers. Since God acts through man, what man creates through his natural capacities is also what God creates through him. Sometimes, however, Hamann resorts to mystical and metaphorical expressions, as if God directly taught Adam how to use language after the creation.

3 Aesthetics

Hamann's historical significance lies in his aesthetics no less than his critique of reason. His main work in aesthetics is his *Aesthetica in nuce*, which appeared as part of his *Kreuzzüge des Philologen*. Its defence of artistic creativity and the metaphysical significance of art had a great influence upon the *Sturm und Drang* and ultimately Romanticism itself (see Romanticism, German).

One of the main aims of Hamann's text is to liberate the artist from the shackles of conventions and norms. *Aesthetica in nuce* is a manifesto on behalf of artistic creativity, a paean to the genius who dares to break all the rules. Rather than aspiring to portray archetypes or models, the artist should dare to express his passions and reveal his personal vision. What makes a work of art beautiful, Hamann suggests, is its expression, the revelation of the personality of the artist.

Another objective of the *Aesthetica* is to reaffirm the metaphysical significance of art, the classical equation of truth and beauty. This significance had been denied or depreciated by most eighteenth-century aestheticians, who usually regarded aesthetic experience as little more than a pleasant sensation or an amusing illusion. According to Hamann, however, art is nothing less than the purest medium of truth. Our knowledge of life and reality comes through immediate experience, and only a non-discursive medium such as art reproduces such sensations and

feelings. While philosophers must resign themselves to concepts, which are only artificial and arbitrary abstractions, artists deal with images, which capture all the vividness and richness of experience.

In defending the equation of truth and beauty, Hamann appears to return to the classical aesthetics of the seventeenth century. Indeed, he even retains the doctrine of imitation, so important for that tradition. But Hamann retained this doctrine in his own manner and for his own purposes. He reformulated it in accord with his empiricist and mystical epistemology, and so at odds with the more rationalist epistemology of classicism. He broke with classicism with regard to both the object and manner of imitation. What the artist should imitate, Hamann thinks, is the secret language of God, not the eternal archetypes of things, as in classicism; and he imitates this language not by following classical rules or norms but by creating images and symbols.

The *Aesthetica* appears to consist in two conflicting doctrines: an extreme subjectivism, which encourages artists to express their personal feelings and visions; and an extreme objectivism, which demands that they imitate nature and reveal the presence of God. What is central to, and characteristic of, Hamann's aesthetics, however, is precisely the synthesis of these doctrines. They come together in Hamann's mystical vision of the omnipresence of God. Since God is inside man, dwelling in man's inner heart, artists have only to reveal their innermost feelings to reveal God himself. Their personal symbols and images then become nothing less than the language of God.

4 Politics

Although not primarily a political thinker, Hamann made some important criticisms of the political doctrines of the *Aufklärung*. In *Golgotha und Scheblimini* (1784), a critique of Moses Mendelssohn's *Jerusalem*, he criticized the prevalent natural law doctrine (see Mendelssohn, M.). Since reason becomes determinate only in a specific cultural context, it is a false abstraction, Hamann argues, to seek some universal and eternal norm true for any culture. Natural law doctrine also assumes that people are rational outside society; yet it is only through society that they learn the use of language, restrain their appetites and conduct themselves according to rules.

In *Kreuzzüge des Philologen* Hamann attacked the individualism prevalent in the modern political tradition. He explicitly appealed to Aristotle's conception of man as a political animal to refute the notion that the individual is selfsufficient and born with natural needs. Freedom and reason are not properties inherent in each individual apart from society, Hamann contended, but only their manner of acting and speaking within it.

Because of his critique of the *Aufklärung* and the liberal values associated with it, Hamann has sometimes been portrayed as a reactionary, indeed as a founding father of the modern alliance of irrationalism and conservatism. But this interpretation is anachronistic, failing to consider the context in which Hamann lived and wrote. All his mature life Hamann was a passionate critic of the reigning Prussian monarch, Friedrich II, 'the philosopher king'. But his critique of Friedrich and the *Aufklärer* in Berlin is not a rejection of their liberal principles - toleration, freedom of press, equality before the law - but of the paternalism and authoritarianism of the absolutist Prussian state. Hamann too embraced these principles, and his critique of the *Aufklärung* is indeed motivated by them. He argued, however, that the *Aufklärer* had betrayed them through their intolerance toward revealed religion and through their alliance with the autocratic Prussian monarch. In his critical review of Kant's essay on enlightenment, Hamann attacked Kant not because he advocated emancipation - the right to think for oneself - but because he restricted it to the public sphere. By denying the people a right to think for themselves in their official duties, Kant had virtually sanctioned Friedrich's despotism, the old maxim 'Say what you like but obey'.

Hamilton, William (1788-1856)

Sir William Hamilton was a leading exponent of the Scottish philosophy of 'common sense'. This philosophy had its origin in the works ofThomas Reid, but it was throughHamilton that it achieved its most subtle form and exerted its greatest influence.

'Common-sense' philosophy, on a superficial view, may seem to hold that philosophical problems should be settled by appealing to the commonly accepted opinions of ordinary people. But that is not *what it holds. The 'common sense' to which it refers are certain powers and beliefs natural to the mind and therefore common alike to the learned and vulgar.Hamilton holds that these powers and beliefs can neither be doubted nor justified. They carry their own authority. This view derives its significance from a point which has often been overlooked. When we doubt or justify a belief, we stand outside that belief and compare it with the world. But the power to compare a belief with the world itself presupposes beliefs about the world. We cannot step outside all our beliefs. That is why, according to Hamilton, certain powers and beliefs must carry authority.*

Hamilton was educated in Glasgow and Oxford. After graduation he entered the legal profession, passing as advocate at the Scottish Bar in 1813. His chief interest, however, was in philosophy. Between 1829 and 1836 he published in the *Edinburgh Review* a series of articles which established his reputation, both in Britain and on the Continent. In 1826 he was appointed to a chair in philosophy at the University of Edinburgh, which he held until his death.

Hamilton wrote very little and was not a gifted writer. In this respect, he suffers in comparison with his predecessor Thomas Reid and his associateHenry Mansel, both of whom were masters of English prose. But he was a deep thinker and a powerful teacher, greatly respected by his pupils. In his time, he exerted an influence on philosophy which extended throughout the English-speaking countries. In the colleges of America, for example, his was the predominant philosophy throughout the greater part of the nineteenth century.

His influence waned after the publication ofJ.S. Mill's *Examination of Sir William Hamilton's Philosophy* (1865). Mill tookHamilton to be the leading opponent of his own empiricism and therefore subjected his views to a severe criticism, which at the time was generally thought to be successful (see Mill, J.S.).

In logic,Hamilton is best known for his view that in the proposition 'All *A* is *B*', one may distinguish between 'All *A* is all *B*' and 'All *A* is some *B*'. This doctrine - known as the quantification of the predicate - served to reduce propositions to equations, thereby preparing the way for mathematical logic. Thus if the letters *X* and *Y* stand for classes, and are regarded as universally quantified, then for 'All *X*s are all *Y*s' one may substitute '$X = Y$'.

Hamilton's more general philosophy may be taken in two parts. The first is a reworking of views he shared with Reid; the second a development of these into a subtle form of realism. The views he shared with Reid may be contrasted with idealism on the one hand and hypothetical realism on the other. The idealist criticism of realism is that it leads to scepticism. The realist holds that the world exists independently of our beliefs. How then can we ever be sure that our beliefs correspond to that world? The hypothetical realist argues that our beliefs may be justified by an argument to the best explanation: that there is an independent world corresponding to our beliefs is the best explanation for our having them. Both these views, however, have an assumption in common. The assumption is that we are not entitled to our beliefs unless they can be supported by reason. It is precisely this assumption, according to Hamilton, which leads to scepticism. If every belief has to be justified, every justification has itself to be justified. The regress is vicious and scepticism inevitable. Against this,Hamilton argued (anticipating the later Wittgenstein) that belief is primary: 'belief is the primary condition of reason and not reason the ultimate ground of belief'.

Hamilton's development of realism is made distinctive by his insistence that knowledge is relative. The essence of realism is that objects exist independently of being known. It follows, on the realist view, that they can be known only in so far as they enter into relations with the mind. But the *existence* of an object does not depend on the relations by which it is known. It is only knowledge which is thus relative, not the existence of the object itself. For example, unless an object reflects light, it cannot be seen; but it exists, whether or not it reflects light. Consequently we have no reason to suppose that what we know of the object, through its reflecting light, is

exhaustive of the object itself. Moreover it is not simply our knowledge of the world which is thus relative; our conception of the world, so far as it is positive, must also be relative. For we have no such conception which does not depend on our knowledge. It follows that we have no positive conception of the world in its ultimate nature, but only of the world as it is in its relations to the mind. Moreover, Hamilton believed that this will always be so; the idea that we may obtain an absolute conception of the world is an aspiration without content and it forms no part of a coherent realism (see Common Sense School).

Modern readers who considerMill's criticism of Hamilton may be inclined to suppose that its success was due not so much to its validity as to the prestige ofMill himself. They may note also that empiricism is no longer as dominant as it was in Mill's day and that there has been a revival of interest in views, such as those of Wittgenstein or the pragmatists, which are clearly related to Hamilton's.

Han Feizi (*c.*280-233 BC)

Han Feizi was the pre-eminent Legalist philosopher. The work attributed to him, the Han Feizi, is his conscious response to the general breakdown of civil order and the interminable inter-state struggle for survival and conquest during the Warring States period (463-222 BC). However, Han Feizi's work transcends the particular circumstances that gave rise to it and addresses perennial philosophical issues that continue to remain relevant.

In the *Han Feizi*, the works 'Gufen' (Solitary Indignation), 'Wudu' (Five Vermin) and 'Shuonan' (Difficulties of the Way of Persuasion) constitute Han Feizi's response to the political pathology of his time. The central and compelling concern was political survival in the vortex of transformation precipitated by the systemic disintegration of what was left of the Zhou feudal order. This overriding political reality in large measure explains the way Han Feizi identified the outstanding political problems of his time: (1) 'learned celebrities' deluding the ruler with irresponsible eloquence so as to undermine the law; (2) itinerant speakers mouthing deceptive theories to serve their own interests; (3) private swordsmen violating the interdicts of government; (4) well-connected courtiers engaging in all manner of corruption; and (5) nonproductive tradesmen and craftsmen collecting useless luxuries and exploiting peasants. These are the 'Five Vermin' that undermine and ruin the state.

Han Feizi identified the root causes underlying these problems and called for a new prescriptive model of sociopolitical organization to remedy them. First, he called for the establishment of objective and impartial standards of human conduct, impersonal standards patterned after *dao* (the Way the natural world works) and free of subjective preferences (see Dao). The term *fa* means both prescriptive standards and penal law; *fa* is designed to remould human behaviour so that individual interest will 'naturally' dovetail with public interest (see Fa). Moreover, it is *fa* alone, not moral suasion, that will serve as the guiding principle of sociopolitical behaviour. Second, authoritative power (*shi*) is 'well-ordered' when it is securely based on clearly established and objective *fa*. Thus, *shi* is the impersonal, institutionalized position of the rulership, rather than a charismatic power to inspire awe and obedience among the masses. Only when *shi* is 'well-ordered' will penal law function properly. Furthermore, *shi* cannot govern effectively without the organizational power of bureaucracy under the centralized control of the ruler. Thus, Han Feizi advocated a rational paradigm of bureaucratic accountability and merit-based functional specificity. The ruler needs to master the 'technique' (*shu*) of controlling bureaucracy by comparing 'word' (proposals) and actual 'performance'. If they tally, reward is in order; if not, then punishment is required. The ruler holds bureaucracy accountable not only by means of empirical verification but also by means of 'The Two Handles' of power over life and death.

Han Feizi elaborated on and synthesized the three interdependent pillars of the Legalist School: the *fa* of Shang Yang (390-338 BC), the *shi* of Shen Dao (*fl.* 310 BC) and the *shu* of Shen Buhai (d. 337 BC). In doing so, he produced a coherent and theoretically sophisticated Legalist philosophy.

Han Wônjin (1682-1751)

Han Wônjin was a major thinker of the Korean neo-Confucian tradition. One of the leading scholars of his time, he is especially remembered as a protagonist in the Horak controversy, which he ignited with the observation that ki *(in Chinese,* qi*) or 'material force' is present even when the mind is in a meditative, quiescent state.*

Neo-Confucian metaphysics is a dualistic monism in which the single *dao* or pattern running through all things is concretized and individualized in real beings only through *ki* (see Qi). The patterning element, known as *i* and often translated as 'principle', also constitutes the innermost nature of all things; its presence as the substance of the human heart-and-mind accounts for our innate potential to respond appropriately to all things and situations (see Xin).

Han's observation that *ki* is always present is consistent with a metaphysics where *i* and *ki* are strictly interdependent and complimentary in function: any real existent always involves both. But in addition to individuation, imperfection or turbidity in *ki* also is a distorting element that accounts for our often imperfect response to things. A cornerstone of neo-Confucian self-cultivation was quiet-sitting, a meditative technique of mental quiescence understood as putting oneself in union with the perfection of *i*, the inner nature and substance of the heart-and-mind. By asserting that even in quiescence the imperfection of *ki* could not be considered absent Han aroused a storm of controversy. His monistic emphasis on absolute interdependence was metaphysically sound, but was problematic in the context of an ascetical system which was naturally more dualistic in emphasis in order to account for perfection and imperfection.

As the controversy unfolded it soon involved issues related to understanding the unitary *i* of the universe as the nature of individual things. His opponent upheld the more conventional bifurcation: considered in itself, *i* is unitary, but considered as concretized and differentiated by *ki* it is the nature of single, individual beings. Han fastened onto the need for a differentiated normative nature: the norm for a cow is not the same as the norm for a human. The problem is that the normative nature conventionally is *i* in itself, unlimited and undistorted by imperfect *ki* - and hence evidently undifferentiated as well. Han introduced a threefold schema: between the unitary nature and the completely individuated one he proposed a unique level, '*i* as based on *ki*'. On this level, *i* would be differentiated as the nature of various species, but not concretely limited to imperfect individuals.

Han's novel doctrine was roundly criticized by opponents as being unintelligible, for the new level seemed neither to consider *i* in itself nor actually join it with *ki*. The controversy crystallized as the question whether the normative 'original' nature was the same or different for all species, and continued for generations without resolution (see Xing). It calls attention to a deep seam in neo-Confucian thought, where the metaphysics of *i* and *ki* synthesize and mask quite different meanings of 'nature' from the Daoist and Buddhist traditions.

Han Yu (768-824)

Among the most important figures in the history of medieval Confucianism, Han Yu helped to redefine and adapt earlier Confucian teachings to the needs of his contemporary society. He strove to make Confucianism a more popular and comprehensive doctrine by devising a basic metaphysics and epistemology to complement the earlier Confucian emphasis on ethics.

Han Yu was a government official, writer, and scholar of the Tang dynasty (618-907) who played a central role in the medieval redefinition of the Confucian tradition. He was the major figure in the transition between the first state-supported formulation of Confucian ideology in the Han dynasty (206 BC-AD 220) and the later transformation of that tradition, known today as neo-Confucianism, in the Song dynasty (960-1279).

The centrepiece of this transformation was a new concept of the Confucian Sage. Whereas early Confucian teachings stressed the ethical dimension of the Sage, Han Yu and his Song dynasty successors worked to broaden this earlier concept of the Sage to include a metaphysical and epistemological dimension. According to most understandings of Chinese intellectual history, their effort resulted from the challenge and popularity of Buddhist and Daoist teachings in the Six Dynasties and early Tang dynasty (see Buddhist philosophy, Chinese; Daoist philosophy).

For Han Yu, the Sage was a person who had achieved a perfect integration in his own daily life between theory and action. In this process, the Sage becomes one with a metaphysical Absolute. This unity is described as *cheng*, translated as ‘integrity, being true to oneself’ (see Cheng). In forging this union, Han Yu sought to discover new epistemological values in the writings of pre-Han Confucian antiquity. In his writings, the phrase *gudao*, or ‘way of antiquity’, assumes an almost philosophical dimension as the source of positive human values.

To extract these values from the text of the Confucian canon, Han Yu espoused an interpretative method known as ‘overall meaning’, which rejected established commentary in favour of an intuitive understanding by direct appeal to the reader’s ‘mind’. The process attempted to make the old texts relevant to contemporary issues and resulted in a concentration on sections of the old canon that best lent themselves to such reinterpretation. One may see in the philosophical writings of Han Yu a concern with those texts that were later to become known as the Four Books: the *Analects, Daxue (Great Learning), Zhongyong (Doctrine of the Mean)* and *Mengzi* (see Confucius; Daxue; Zhongyong; Mencius).

Han Yu also constructed for his rejuvenated Confucianism a lineage or progression of orthodox teachers from antiquity down to his own time. The contemporary Chan Buddhist system of master-disciple lineages probably stimulated Han Yu’s thinking in this area, and the formation of such lineages became an important concern of later neo-Confucianism. Han Yu was known both in his own day and in later times primarily as a man of letters and creator of *guwen*, the ‘literature of antiquity’, a style of writing that was intended as a literary reflection of the ‘way of antiquity’.

Hanslick, Eduard (1825-1904)

Eduard Hanslick, a music critic for the popular Viennese press, is principally known as the author of Vom Musikalisch-Schönen (1854). This is probably the most widely read work in the aesthetics of music for both philosophers and musicians, and remains the starting point for any discussion either of the place of emotion in music, or of the doctrine usually referred to as 'musical purism'. On the former, Hanslick maintained what he calls the negative thesis, which 'first and foremost opposes the widespread view that music is supposed to represent the feelings'; on purism, he proposed the positive thesis or antithesis, 'that the beauty of a piece of music is specifically musical, that is, is inherent in the tonal relationships without reference to an extraneous, extra-musical context'.

1 Major arguments

What was Hanslick denying? As becomes clear in the progress of his argument, the negative thesis denies that it is any part of the office of music, *qua* music, to arouse or represent 'feelings' of the kind I shall call 'ordinary', by which I mean feelings or emotions such as love, fear, hatred, anger and the like. Two further possibilities remain open: that music might arouse some other kind of feeling as part of its essential nature, and that it might arouse the ordinary emotions, but in an aesthetically irrelevant context. As we shall presently see, Hanslick affirmed both.

Hanslick presents three basic arguments in support of the negative thesis, all of which take the following general form. Music demonstrably does not (or cannot) arouse or represent the ordinary emotions in any aesthetically relevant way; therefore it cannot be any part of the aesthetic purpose of music to do so.

The first of these arguments, and certainly the most subtle, is this: 'The representation of a specific feeling or emotional state is not at all among the characteristic powers of music' because such feelings or emotional states 'depend upon ideas, judgments, and (in brief) the whole range of intelligible and rational thought to which some people readily oppose feeling' (1854 (1986): 9). In other words, emotions cannot either exist or be 'represented' in the absence of what contemporary philosophers, following Franz Brentano (§3), call 'intentional objects'. And music cannot in any way make those intentional objects available to the listener. Particularly in the latter form, the argument seems generally persuasive, although a possible response to each form of the argument might at least serve to qualify it. For it might be argued both that there are other ways that music can make up for lack of intentional objects in representing the emotions, and at least peripheral ways in which some emotions are perhaps aroused without them.

The second argument, which might be called the 'argument from disagreement', is directed specifically against the possibility that music can represent the ordinary emotions (although, if good, it would apply with equal force to their arousal). It is simply that, according to Hanslick, since there is no consensus at all in any individual case about which emotion a passage of music may represent, it cannot make sense to say that it can represent any at all. But anyone who has ever played passages with distinct emotive character to a typical listener or indeed has read any critical literature (including Hanslick's), will find Hanslick's premise of chaotic disagreement utterly false, and emotive consensus, at least within reasonable limits, fairly widespread. Nor, given the historical continuity of our musical materials, could this consensus come as a surprise to anyone who had not begged the question against it from the outset.

Hanslick's final argument is based on the growing awareness in the nineteenth century that composers of earlier times recycled their music, and in particular that they sometimes used the same music for different texts. It charges that if the same music can seem emotively appropriate to two texts of very different expression, one cannot say that the music has any particular emotive character at all. However, this is clearly a case of drawing an extreme and false conclusion from an undoubtedly true premise. And Hanslick's prime example, Handel's well-known use of music from his erotic love duets for sacred choruses in *Messiah*, simply shows that music expressive of melancholy or joy can seem appropriate both to the joy and melancholy of erotic love and to the joy and melancholy of the Christian religion, which is by no means surprising, and hardly proof that the music is not expressive both of joy and melancholy.

Of the positive thesis, little need (or can) be said here because, apart from some suggestive and, as it turned out,

fruitful metaphors, Hanslick was able to give his concept of musical beauty little substantive content. The metaphor which is most remembered, and in the event proved most fruitful, is: ‘The content of music is tonally moving forms’ (1854 (1986): 29). Hanslick combined this recognition of absolute music (that is, instrumental music) as a formal structure in apparent motion with the equally important ‘intuition’ that the formal structure is not merely a kaleidoscopic pattern (another of his metaphors) but a quasi-syntactical one, bearing, in that respect, an analogy to language. Beyond such intriguing, though fragmentary, remarks Hanslick was not able to put forward a systematic musical purism.

2 Music and emotion

The question now remains of what role, if any, human feeling plays in Hanslick’s musical philosophy. As regards the ordinary emotions, Hanslick does not deny them a role, but explicitly affirms that ’music can nevertheless excite such feelings as melancholy, gaiety and the like (can, not must) (1854 (1986): 9-10). How is this consistent with the negative thesis? It is consistent because what the negative thesis asserts is that it is no part of the *aesthetic* significance of music to arouse the ordinary emotions; it indeed *cannot* arouse them in an aesthetically meaningful way. What it can do is arouse such emotions in those who, by virtue of particular personal associations or a ’pathological’ nervous condition, may be abnormally susceptible.

Are we to conclude, then, that Hanslick views a proper experience of music as completely ’cold’ and ’unemotional’? Such a view would be hard to credit, but there is no need to impute it to him, for nothing he says implies it, and one intriguing passage, in the Foreword to the Eighth Edition (1891), suggests just the right response to the question. Hanslick writes: ’I share completely the view that the ultimate worth of the beautiful is always based on the immediate manifestation of feeling’ (1854 (1986): 22). Can we not read this as an assertion of the undoubted truth that the beautiful always deeply moves us upon its recognition? And what is true of beauty *sans phrase* must also be true of musical beauty. Beautiful music can no more leave those who perceive it unmoved, unfeeling and emotionally untouched than beauty in any instance.

The weakness in Hanslick’s position lies, then, not in his inability to accommodate an emotionally involved listener; rather, it involves his denial that music can sensibly be characterized in terms of the ordinary emotions. Apparently seeing emotive arousal or emotive representation as the only possible avenues to specific emotive description, and rejecting both for at least one of the right reasons, he was left with the implausible conclusion that calling music ‘sad’ or ‘happy’, ‘angry’ or ‘yearning’, is either figurative or foolish. But other ways in which music might ‘embody’ the ordinary emotions have been explored since Hanslick’s time; and there is a growing consensus that this aspect of his negative thesis is in need of serious revision. Nevertheless, *Vom Musikalisch-Schönen* remains the starting point of the philosophical aesthetics of music and its first modern text, and suffices to keep Eduard Hanslick’s name alive.

Hanson, Norwood Russell (1924-67)

Hanson was a philosopher of science who introduced novel ways of relating logical, historical and linguistic analyses. His best-known book, Patterns of Discovery, stressed the theory-ladeness of observational reports and argued that causality is a feature of inference systems, rather than of nature as such. He pioneered in combining historical and analytic analyses of significant breakthroughs in science. Though he clarified patterns of discovery he never succeeded in the project of developing a logic of discovery, or an account of the inferences leading from problematic situations to novel explanatory hypotheses. A man of many talents, he also made contributions to the history of science, aerodynamics and epistemology.

Hanson was born in west New York, made his undergraduate studies at the University of Chicago, served as a marine fighter pilot in the Second World War, did further studies at both Oxford and Cambridge, where he became the first university lecturer in the philosophy of science. In 1957 he returned to the USA, set up the department of the history and logic of science at Indiana University, and vociferously opposed McCarthyism. In 1962 he accepted a position as philosophy professor at Yale. He died when the beloved Bearcat he was flying crashed into a mountain near Cortland, New York.

Hanson was a baseball player, a Golden Gloves heavyweight boxer, a proficient classical trumpet player, an artist especially adept in illustrating Homeric heroes, a decorated fighter pilot (Air Medal, Distinguished Flying Cross) shot down over Japan, a gadget designer, a daredevil pilot who set speed records for propeller driven airplanes, and a prolific writer in both the philosophy and history of science. The tension and conflict that stimulated him were reflected in his way of doing philosophy. He introduced into logical positivism analytic methods developed by the later Wittgenstein (see Logical positivism §3). Though, with the positivists, he professed a belief that the history of science is irrelevant to the philosophy of science, he pioneered the use of critical historical reconstructions as a testing ground for philosophical accounts of science. His first, and most influential book, *Patterns of Discovery* (1958), treated the issues that were explored in his later writings.

Hanson popularized the term 'theory-laden observation' (see Observation §§3-4), which he intended in a rather Wittgensteinian sense. One cannot *see* something *as* an X unless one already has the concept of an X. Such 'seeing as' depends more on acquired skills than on formal theories. His emphasis played a historically significant role in undercutting the positivist ideal of reporting observations in a theory-neutral language. Hanson's treatment of facts and causes illustrates his fusion of positivism and analysis. A fact is something reported in a that-clause: the fact that…. This requires a classification of propositional types into necessary and contingent, a priori and a posteriori, general and particular. This positivistic technique was supplemented by an analytic insistence that the meaning of terms used to report facts depends on their use. Scientific breakthroughs occur when old presumptions are discarded in favour of new ways of observing and reporting. Hanson supplemented this analysis by detailed historical studies of how Kepler used ellipses as a tool to approximate distorted circular orbits and finally saw that the ellipses fit the data; and of how a protracted muddling through involving Galileo, Descartes and Beeckman, finally led to a correct account of free fall. He explained causality as a feature of our explanations of nature, rather than of nature itself. We introduce causes to explain phenomena. In experiments we try to develop causal chains, not because these chains really describe nature, but because they simplify inferences.

The most novel feature of Hanson's philosophy of science was his protracted attempt to develop a logic of discovery. Detailed analysis of historical examples led to a general pattern of discovery. A curious iconoclast challenges traditional ways of reporting and explaining and comes to see accepted facts as involving problematic relationships. A tentative hypothesis, introduced to explain the newly perceived problem, must meet various criteria: initial plausibility, coherence with accepted background assumptions, logical and empirical constraints on testing hypothesis. A logic of discovery concerns inferring novel hypotheses from problematic situations.

This project encountered two chief difficulties. The first was the Newtonian precedent of rejecting any reliance on hypotheses. This Hanson tackled through his analytic approach to history. After distinguishing different senses of hypotheses he showed that Newton rejected the scholastic type of subjunctive hypothesis and emphatically rejected any Cartesian-style metaphysical hypotheses. However, Newton repeatedly and fruitfully introduced his own type of hypothesis, a categorical proposition that, if true, would both explain phenomena and also lead to

testable consequences. The second difficulty concerned the suitability of the term ’logic’. Here Hanson eventually distinguished between the precise hypothesis tested and inference from a problematic situation to a suitable type of hypothesis. This, he insisted, was a rational process although he could not formulate logical rules governing it.

Hanson championed the Copenhagen interpretation of quantum mechanics (see Quantum mechanics, interpretation of §3). He supplemented his flying activities with studies of the history and physics of aerodynamics. He became proficient in celestial mechanics and used detailed analyses of historical examples to illustrate subtle differences between philosophical ideals of explanation and the types of explanation scientists are willing to accept. He defended atheism on the grounds that there is no good reason for believing in the existence of a personal God, and attacked agnosticism as a timid compromise.

Hanson readily provoked controversy and polarized conferences into his adversaries and his supporters. He never produced a school of disciples nor developed a general system. His talent was for attacking, rather than formulating, systems.

Happiness

In ordinary use, the word 'happiness' has to do with one's situation (one is fortunate) or with one's state of mind (one is glad, cheerful) or, typically, with both. These two elements appear in different proportions on different occasions. If one is concerned with a long stretch of time (as in 'a happy life'), one is likely to focus more on situation than on state of mind. If a short period of time, it is not uncommon to focus on states of mind.

By and large philosophers are more interested in long-term cases. One's life is happy if one is content that life has brought one much of what one regards as important. There is a pull in these lifetime assessments towards a person's objective situation and away from the person's subjective responses. The important notion for ethics is 'wellbeing' - that is, a notion of what makes an individual life go well. 'Happiness' is important because many philosophers have thought that happiness is the only thing that contributes to wellbeing, or because they have used 'happiness' to mean the same as 'wellbeing'.

What, then, makes a life go well? Some have thought that it was the presence of a positive feeling tone. Others have thought that it was having one's desires fulfilled - either actual desires (as some would say) or informed desires (as others would say). It is unclear how stringent the requirement of 'informed' must be; if it is fairly stringent it can, in effect, require abandoning desire explanations and adopting instead an explanation in terms of a list of good-making features in human life.

1 The ordinary notion

'Happiness' is a central term - for some philosophers *the* central term - in ethics. It is also a term in everyday speech, and one should be aware of how the philosophical and the ordinary uses of the word are related.

'Happy' comes from the noun 'hap': what just happens, chance, luck. It came to mean having good hap, fortunate, lucky, a sense that it still retains (death can be a happy release). Etymology is not meaning, but there is a large etymological residue in our current use of the word. In a very common use now, to be 'happy' is to be satisfied or contented with having a good measure of what one regards as important in life. In this use of the word, 'happy' has to do with one's situation; one is fortunate. It also has to do with one's state of mind; one is glad or cheerful. It typically has to do with both situation and state of mind (one has the latter because of the former), but the two elements can appear in very different proportions in different cases. At one extreme, a martyr can go happy to the stake, merely secure in the conviction of right. At another extreme, a person can be happy (cheerful) for a few moments before realizing how unfavourable the situation actually is. There are other current uses of the word as well; for example, 'happy' can mean 'productive of favourable results' (a happy intervention). There is no definition of 'happiness', in the sense of a list of essential properties. Few words in a natural language, especially words covering as much ground as 'happiness', allow definition in that form. We can use these words correctly; hence we know their meaning. But we know it by catching on to the use of the words, not by catching on to a set of defining properties.

'Happiness' does not mean the same as 'pleasure', despite J.S. Mill's definition (1861) (see Mill, J.S. §8 Pleasure). He defined 'happiness' as 'pleasure, and the absence of pain'. But the words mark different features of life; the martyr who goes happy to the stake is unlikely to do so with pleasure. Nor does 'happiness' mean the same as 'wellbeing', if the latter term is used, as it often is, of one's actual situation. Because of the psychological element in the word, one may be 'happy' when things are going badly for one, if one is unaware that they are.

There are, as we have noted, two important strands to happiness, one's situation and one's state of mind. If it is a long stretch of time that one is interested in - say, 'a happy life' - one is likely to focus more on situation than on a flow of psychological states. If it is a short period, it is not uncommon to focus on psychological states. By and large philosophers are more interested in the long term use. Certain tensions can emerge in speaking of 'happy lives'. One's life is happy if one is content that life has brought one much of what one regards as important. The standard case is one in which one regards certain things as important because they *are* important and one thinks that life has brought them because it *has* brought them. But what happens to the use of the word 'happiness' if one or other of the standard conditions fails? Think, for instance, of a society in which women's expectations are very low. Aspirations are largely relative to expectations. A particular woman in that society might be pathetically

content with a small improvement in her generally miserable lot. Would we say that she has a ‘happy life’ merely because she is content? There would be strain in saying so because there is some pull in these lifetime assessments towards a person’s objective situation, and away from the person’s subjective responses. People may have various views about what good fortune in life is, but when they explain their conception of a happy life they will describe what they regard as good fortune, not what they believe, justified or not, will produce states of contentment or cheerfulness. I have been speaking of a tension in our use of the word ‘happiness’. There is also a troubling tension in our attempts to be happy. One route to happiness is to strive to achieve more of what is important in life. Another route is to be content with what one has already got. It is not easy, though just possible, to take both routes.

2 The notion in philosophy

‘Happiness’ is not the important notion in ethics; ‘wellbeing’ is - that is, a notion of good fortune, of what makes a life go well. ‘Happiness’ is important only if one thinks, as many philosophers of course have thought, that happiness is the only thing that contributes to wellbeing (a substantive claim), or if one uses ‘happiness’, as some philosophers have used it, to mean the same thing as ‘wellbeing’. What we want, and what philosophers have generally been in search of, is an account of what it is for a life to go well.

Aristotle spoke of ‘eudaimonia’ (literally, ‘good divine power’ or ‘good fortune’), normally translated in English as ‘happiness’ (see Eudaimonia). For him, it is the central term in ethics. ‘What is the supreme good attainable in our actions? Well, so far as the name goes, there is pretty general agreement. "It is happiness," say both intellectuals and the unsophisticated, meaning by "happiness" living well and faring well’ (*Nicomachean Ethics* 1095a). Aristotle’s notion therefore is what I have called ‘wellbeing’ - what actually makes a life go well - and it is often thought that the prominent psychological element in the English word ‘happiness’ makes it an inappropriate translation for ‘eudaimonia’. But even if ‘eudaimonia’ and ‘happiness’ do not mean quite the same, it does not follow that Aristotle, on the one hand, and anglophone philosophers who have used the term ‘happiness’ on the other, are talking about different things. For the reason given earlier, they are often both talking about wellbeing and, if they say different things about it, they may well be making contrary claims (see Aristotle §§21-2).

It is a plausible thought that faring well in some way involves acting well. How are virtue and happiness related? Some, such as Socrates, Plato, and Aristotle on some interpretations, have held that virtuous action is necessary and sufficient for happiness (see Plato §14; Socrates §4). On this view, all that matters for happiness is internal to one’s will: happiness *is* being virtuous and nothing else. Others, including Aristotle on other interpretations, have held that, important though virtue is to happiness, it is not all there is to it; external conditions such as health, wealth and avoidance of disasters matter too. Still others have thought that virtue is generally inimical to happiness (Thrasymachus as depicted by Plato in the *Republic* and Thomas Hobbes on some interpretations). It is somewhat easier to argue that virtue is sufficient for happiness than that it is necessary. Some elements of a good life (say, accomplishing things such as creating great art or making major scientific discoveries) do not seem to lose their value just because the agent concerned is not virtuous. If we could resolve these issues in favour of the first option, we should have a powerful answer to the vexed question, ‘Why be moral?’ Because, we could then say, it is a (or the only) way to be happy.

The most prominent use of the term ‘happiness’ in modern philosophy is to be found in the work of utilitarians (see Utilitarianism). They hold that acts are right in virtue of the value of their consequences, and what makes consequences valuable, according to classical utilitarians, such as Jeremy Bentham, J.S. Mill and Henry Sidgwick, is the presence of pleasure or happiness (see Consequentialism). This appeal to pleasure or happiness, although historically important in utilitarianism, is not essential to it. A utilitarian may say, and many modern utilitarians have said, that several irreducibly different things, perhaps including happiness, are valuable. The classical utilitarians put the term ‘happiness’ to various theoretical uses. Some of them used it in an empirical theory of action (psychological hedonism), which claims that pleasure or happiness is the only end which in fact we desire or at which we aim. They also used it in a normative theory of the ends of life (ethical hedonism), which claims that pleasure or happiness is the only thing worth acting for (see Hedonism §2). Once ‘happiness’ is given these theoretical roles, it comes under pressure to grow to fill them. If happiness is what in fact we aim at, then the term ‘happiness’ must encompass all that in fact we aim at (for example, saving one’s children at the cost of one’s own life). If it is the only thing worth aiming at, then whatever is worth aiming at (such as saving one’s children at the

cost of one's own life) must be fitted under the term 'happiness'. It is not that the term cannot be stretched to include them; it is rather that once it includes them it may have become a technical term, and we should then need to know its technical sense. The natural elasticity of the word 'happiness' can easily lead to confusion. It is easy to be deceived by shifts of sense such as this: 'happiness is what makes a life good' (a substantive claim: happiness is the one and only end in life); 'happiness is what makes life good' (a tautology: 'happiness' means 'what makes a life good').

The classical utilitarians paid insufficient attention to the meaning of their central term. Jeremy Bentham seems to have thought of 'pleasure' or 'happiness' primarily as a positive feeling tone. But when he defined 'utility', he described it as 'that property in any object, whereby it tends to produce benefit, advantage, pleasure, good, or happiness (all this in the present case comes to the same thing)' (1789: 12), thus running together what improves one's situation and what produces certain mental states. J.S. Mill's approach was more complex. What links valuable states for him is that they are pleasurable, but this is not a case of there being any common positive feeling tone running through them all. In *Utilitarianism* (1861), he famously claims that pleasures differ in quality as well as quantity: states of higher quality are those that we prefer when sufficiently informed. Then, returning to differences in quantity, he observes that pleasures are not homogeneous, and that pleasure is always heterogeneous with pain. Informed preferences, he says, enter too in determining which is the greater of two pleasures or the worse of two pains. He may mean merely that the preference of the informed judge is a way for us to *learn* which pleasure is greater, but he sometimes seems to suggest that being the object of an informed preference is all that we can *mean* by a pleasure's being greater. Henry Sidgwick also adopted a preference account. He thought that the only things that we wanted for their own sakes were mental states, but that there was no single feeling tone running through all of them that gave them their unity. What unified them was that they were desired. The ultimate good, he concluded, was 'desirable consciousness' (1874: 397).

3 'Wellbeing', 'welfare', 'utility' and 'quality of life'

It is because 'wellbeing' (or 'welfare', 'utility', 'quality of life') is the important notion in ethics, not 'happiness', that most attention now goes to it (see Welfare). What, then, makes a life go well? How one answers that question will depend on how many of the following arguments one finds persuasive.

Wellbeing is not simply a positive feeling tone. There is no one tone running through all the things that make a life go well. Wellbeing, one might instead say, taking a lead from Sidgwick, is the fulfilment of desires. However, despite what some economists say, it certainly could not be the fulfilment of one's actual desires; they can be fulfilled and one be worse off. It would have to be, as Sidgwick himself says, the fulfilment of informed desires. But 'informed' in what sense? Suppose we say that a desire is informed if it exists when I am aware of all relevant facts and I commit no logical error (Brandt 1979: 10). But an irrational desire might well survive criticism by facts and logic, and its mere survival is less than it takes to make one better off. For instance, a man might have a crazy aim in life - say, counting the blades of grass in various lawns (Rawls 1971: 432-3). He accepts, let us say, that no one is interested, that the information is of no use, and he makes no logical error. Still, it is unlikely that we would regard the fulfilment of this obsessive desire as, in itself, enhancing his life - apart, that is, from preventing anxieties or tensions that might be set up by frustrating the desire, which are not the point. Cases like this suggest that our standard of 'informed' is not stiff enough yet. To make it stiffer, though, we should have to make desires 'informed' in some such strong sense as 'formed in proper appreciation of the nature of their object'. But this makes the mere occurrence of desire much less important and the nature of the object of desire much more important.

We might say therefore, as many philosophers do, that there are many different things that enhance life: happiness, seen as a state of mind, might be one, but perhaps also accomplishing something in the course of one's life, knowledge of certain basic metaphysical and moral matters, deep personal relations, and so on. Wellbeing, we could say, consists in having good things (a list of which we could provide).

The list-account of wellbeing has the potential of being much broader than the happiness-account of classical utilitarianism. Philosophers now debate just how broad it can be. Sidgwick thought that nothing enhanced a life unless it entered consciousness or experience. One might call this the 'experience requirement'. But some think that the requirement is too restrictive. They say that we sometimes want things other than states of consciousness, and these things seem to make our lives better. For instance we may desire a good reputation among people we

shall never know about, or posthumous fame, or to accomplish something with our lives. One way to clarify one's thoughts on this issue is to ask: supposing there were a foolproof machine that would give one any experience one wanted, would one plug in? What could matter except how life feels from the inside? Many would answer that what they want is to accomplish something with their lives (such as write a good novel, or discover a cure for AIDS), not to have the impression that they are. Many would say that they also want simply to be in touch with reality, even at a cost in desirable consciousness.

Some philosophers think that if, for these reasons, we drop the experience requirement, the list of things that make a life better will grow counter-intuitively large. Without the requirement, we seem to have to fall back on the view that wellbeing is the fulfilment of desires formed in proper appreciation of the nature of their object. I want our twenty-fifth century successors to flourish (any moderately decent person would), but surely the fulfilment of that desire centuries from now will not retroactively make my life better. The fulfilment of such desires has to be excluded, but the experience requirement is not the only way of doing it. The list-account of wellbeing will do it too. The list is composed by identifying what enhances life. Nothing enhances life but instances of items on that list: happiness, knowledge, accomplishment, personal relations, and so on. The fulfilment of my desire for our twenty-fifth century successors to flourish may be excluded simply because it does not fit under any of the headings on the list that we should eventually compile.

Hare, Richard Mervyn (1919-)

R.M. Hare is the creator of the ethical theory called 'prescriptivism'. This holds that moral statements differ from purely factual ones in prescribing conduct; they differ from simple imperatives in invoking universal principles that apply to all similar cases. The theory has three aspects: prescriptivity and universalizability as formal features of moral statements; appeal to the Golden Rule (that we should do to others as we wish them to do to us) for selecting moral principles; two levels of practical thinking, critical and intuitive.

1 Prescriptivity and universalizability

Richard Hare is a British philosopher, educated at Oxford, who has held chairs in moral philosophy at Oxford and Gainesville, Florida. His best-known work, *The Language of Morals* (1952), introduces a distinction between prescriptive and descriptive meaning. Prescriptive meaning is defined in relation to imperatives: a statement is prescriptive if it entails, if necessary in conjunction with purely factual statements, at least one imperative; and to assent to an imperative is to prescribe action. Descriptive meaning is defined in relation to truth-conditions: a statement is descriptive to the extent that factual conditions for its correct application define its meaning. In this usage, the factual is that which is only contingently motivating: desire is no part of sincere assent to a purely factual statement. The meaning of a moral statement is prescriptive, but may also be partly descriptive. Thus '*A* [a person] ought to Čphis;' entails the imperative 'Let *A*Čphis;', so that to assent to it sincerely is to have an overriding desire (which in application to oneself will amount, if its satisfaction is practicable, to an intention) that *A*. If there are agreed reasons for -ing within a linguistic community, for example that it is enjoyable, '*A* ought to Čphis;' may take on the descriptive implication 'Čphis;-ing is enjoyable'. '*X* [a person, object or whatever] is a good *F* [a kind of thing]' prescribes choice within a certain range; it takes on a descriptive connotation if there are agreed standards for assessing *F* 's. Cases of failing to try to do what one admits one ought to do may involve psychological incapacity, or an off-colour use of 'ought' whereby it retains descriptive meaning but loses its prescriptive meaning. What the modal '*A* ought to Čphis;' adds to the simple 'Let *A*Čphis;' is universalizability: one who assents to the former is implicitly accepting a universal principle that applies equally to anyone else whose condition and situation are identical in kind (see Prescriptivism).

2 The Golden Rule

Freedom and Reason (1963) extracts from these features a mode of reasoning, the so-called 'Golden-Rule Argument', for selecting moral principles; this was subsequently clarified and fortified in writings leading up to *Moral Thinking* (1981). In wondering whether to assent to the statement '*A* ought to Čphis;', I have to reflect whether I can prescribe that everyone should act in the same way in every possible world, whatever my role within that world. (This talk of possible worlds is useful, though Hare denies it to be essential.) 'I' connotes no essence (for example, human): I occupy every possible role in some possible world. But there is a prescriptive aspect to its meaning: to take a role within some possible but non-actual world as *my* role is to give weight to the desires of the occupant of that role as if they were actually my own. Hence, I can rationally assent to a particular 'ought'-statement only if it is derivable from some universal principle that I shall accept if I give impartial and positive weight to all preferences whose fulfilment would be affected by its fulfilment. Thus moral reflection generates a universalized prudence. Possibly it should also respect 'external' preferences, that is, the preferences of those (say the dead) who will *experience* no satisfaction; *Moral Thinking* leaves this as 'unfinished business'. Moral ideals register within this framework simply as universal preferences; to allow one's own ideals to override the stronger or more prevalent desires and ideals of others is a kind of egoism, and so excluded. The upshot is a variant of utilitarianism that aims at the maximization not of happiness, but of the satisfaction of preferences (see Utilitarianism §2). Human decision remains free, however rational and informed, because anyone can avoid the constraints of morality by declining to moralize; for this reason, 'is' still fails to entail 'ought'.

3 Critical and intuitive thinking

Reasoning according to the Golden Rule will ascribe maximum observance-utility to highly specific universal principles. However, a greater acceptance-utility may attach to more general principles that it is easier to apply without error or self-deception. *Moral Thinking* elaborates a distinction between a 'critical' level of thinking, conducted by 'archangels' with the use of the Golden-Rule Argument, and an 'intuitive' level, conducted by

'proles' with the use of simple principles (often articulating emotional responses) whose acceptance can be justified at the critical level. These two levels define not two social castes, but two roles between which each of us learns to alternate as appropriate. Intuitive objections to utilitarianism (such as that it neglects rights) can often be accommodated at the intuitive level, and then cease to be objections (see Intuitionism in ethics §3).

Hare further argues that prescriptivism guarantees objectivity, while descriptivism collapses into relativism. How I can rationally apply the terms 'right' and 'wrong' is determined by what I can will universally, which rides free of the contingencies of my own tastes and intuitions. But if the correct application of such terms was determined by their descriptive meaning within some linguistic community, it would be relative to the culture and ideology of that community. Only a prescriptivist ethics can achieve moral universality. The theory has received much critical attention, and while few may accept it as a whole, the simplicity and fertility of its main ideas make it a paradigm of practical philosophy.

Harrington, James (1611-77)

Harrington was the premier English republican political theorist. His The Commonwealth of Oceana (1656), published soon after the Civil War, analysed the collapse of monarchy and recommended institutions for a perfect commonwealth. He argued that forms of government were shaped by modes of land tenure; the decline of the feudal aristocracy and rise of the gentry rendered monarchy inviable. His proposed republic entailed regular elections for all public offices and secret ballots among a citizenry of independent gentlemen. Harrington influenced English, American and French radicals throughout the eighteenth century. Today he tends to be a talisman for those who would inject an aspect of 'civic republicanism' or 'public virtue' into contemporary politics, by contrast with the liberal rights theories of the natural jurisprudence tradition.

1 Life and works

Born to a gentry family in Lincolnshire, Harrington studied at Oxford and the Middle Temple. In the 1630s he served as a volunteer in the Thirty Years War in Germany and undertook the Grand Tour, visiting France and Italy. He served King Charles I and accompanied him during his captivity: his republicanism was not grounded in personal animosity. His publishing career was brief. His chief work, *The Commonwealth of Oceana*, appeared in 1656, and was followed by a series of vindications. His notoriety was greatest in 1659-60 when the Rota Club met in a London coffeehouse to debate models of government. Harrington fell silent after the restoration of monarchy in 1660, and was briefly jailed. He died apparently insane.

Oceana is dedicated to Oliver Cromwell; its Legislator, called Olphaus Megaletor, is plainly an Oliverian figure. Like other republicans, Harrington saw Cromwell's Protectorate as a betrayal of the 'Good Old Cause', a return to quasi-monarchic rule, yet he appealed to Cromwell to act heroically as midwife to a utopian commonwealth. Sir Henry Vane's *A Healing Question* and Marchamont Needham's *The Excellency of a Free State* were published in the same year (1656). The Harringtonians were pervasively civic humanist in their language and committed to constructing republican institutions - unlike John Milton, whose 'republicanism' amounted to a defence of king-killing, couched in the language of natural jurisprudence (see Republicanism).

Harrington's mentors were Aristotle, who provided the concept of the self-sufficient gentlemanly household; Polybius, who celebrated the mixed and balanced polity; Machiavelli, who suggested the emphasis on arms and citizen militias; and John Selden, who documented English feudalism. Harrington admired the republics of ancient Rome and modern Venice, as well as Israel in the age of the Judges. His hero-lawgivers were those of the Renaissance humanists: Solon, Lycurgus, Numa, Romulus and (echoing Machiavelli) Moses. Harrington was transfixed by 'the archives of ancient prudence' and by Machiavelli, 'the only politician of later ages', whom he read as the republican idealist of the *Discourses*.

There is also a distinctive Platonist voice. Harrington's only essay in metaphysics was his *Mechanics of Nature* (written around 1662 and published posthumously in 1700). It shows him to have adopted a hylozoist and pantheist position. Behind nature and human polities lies the *anima mundi* or world-soul. More broadly, Harrington inclined towards Socinianism. Grace and charism have little place: the divine is fulfilled through natural virtue, and the Kingdom of God is no other than the perfect commonwealth.

2 The argument of *Oceana*

Oceana is divided into two parts, a diagnosis of contemporary England in 'The Preliminaries', followed by a description of the imagined commonwealth. 'The Preliminaries' are known for their doctrine that forms of government tend to follow the 'balance of property', and hence that the art of politics consists of 'the skill of raising such superstructures of government as are natural to the known foundations' (1656 (1977): 202). There are 'natural' (stable) and 'violent' (unstable) governments, those which accord with, or violate, their tenurial foundations. Harrington argues that the two centuries prior to the Civil War saw a drastic change in the balance of property. Crown and aristocratic lands were gradually distributed to the gentry. Without the support of a dominant nobility, or a standing army, kingship became unsustainable. Thus, the feudal or 'Gothic' polity, in which land was the reward for military service to the crown, was gone forever. Harrington's editor, John Toland, remarked, 'that empire [government] follows the balance of property, whether lodged in one, in a few, or in many hands, he was

the first that ever made out; and is a noble discovery…the foundation of all politics' (1700a: preface).

The institutions of Oceana are grounded in the new circumstances of a gentry commonwealth. Oceana has a senate composed of 300 of the wealthier landholders, who have the power of debate, and an assembly of 1,050 smaller freeholders, who have the power of resolution. There is a three-year term of office, one-third of each house coming up for election annually. The citizen body - the electors - must be economically independent (not servants or poor), be over 30 years of age, and have served in the militia. There are four executive councils - of state, war, religion and trade - and members must stand down after two years in office. Olphaus Megaletor is the presidential figure. All offices, including religious and military, are elective, with regular rotation: 'They, who do command today, shall learn again tomorrow to obey'. The basic geographical unit remains the parish (rationalized into 10,000 in number), revitalized as the locus of civic life. There are counties and hundreds, but no boroughs: this is a resolutely rural commonwealth. Each year, one in five citizens compulsorily serves in the militia.

A crucial stipulation is the Agrarian Law, which, through the abolition of primogeniture and a ceiling of £2,000 worth of property, aimed to prevent the emergence of an overweening oligarchy. The Agrarian Law renders Oceana 'an immortal commonwealth', free from the instability of the Polybian cycles of rise and decline. It also inclines Oceana more towards the Athenian model of democracy than was customary among the Roman-inspired Renaissance republicans, although the presidential and senatorial elements sufficiently exemplify the traditional one-few-many formula.

The whole fabric is designed to ensure 'an empire of laws and not of men', a regime of reason and not of mere will. It is a commonwealth which nurtures civic virtue and service to the public. The landed gentleman governs himself and so is fit to govern the polity. The obverse of virtue is corruption: tyranny is that which serves private or factional interests rather than the public good (see Corruption §§1, 3).

3 Interpretations

Modern interpretations of Harrington fall into three camps. One group, in the thrall of positivist political science, celebrates Harrington's empiricism and secularism, his grasp of the mechanics of power and the calculus of interest. A second group, Marxian-inspired (notably R.H. Tawney, Christopher Hill and C.B. Macpherson), finds in Harrington an economic determinist, the first theorist to offer a structural interpretation of the English Revolution, and a spokesman of the bourgeois gentry. The third group (J.G.A. Pocock and his followers) emphasizes the civic humanist character of Harrington's thought. Against the political scientists, the Pocockians point to his Platonic and occasionally millenarian language. Against the Marxians, they argue that Harrington was no determinist, and that his grasp of economics went no further than land tenure. His account of the transition from feudalism rested on the contingent political changes by which Henry VII and Henry VIII curtailed aristocratic estates and retinues, and redistributed monastic lands. The Agrarian Law manifestly limits a free market in land.

Some attention has been paid to Harrington's 'civil religion'. Clerics quickly attacked *Oceana*, and Harrington retorted with extensive discussion of ecclesiastical power. He was vehemently anticlerical, praising Hobbes (from whom he otherwise diverged) for his critique of the pretensions of papalists, prelatists and presbyterians. Harrington coined the word 'priestcraft'. *Oceana* is secular in the sense that it rejects divine right clericalism and embraces religious toleration within a broad church. Yet Oceana is a Christian commonwealth, indeed one in which the Church finds its apotheosis in the commonwealth itself. Harrington argues that it was so in Israel, and he explains that the Greek '*ecclesia*' or 'congregation' meant only the civic assembly of the citizens. The ancient manner of choosing clergy by popular vote - *chirotonia* - was perverted by usurping ecclesiastics into the practice of clerical 'laying on of hands' - *chirothesia*. Harrington's millenarianism is most visible in his recommendation that Ireland be colonized by the Jews.

4 Influence

Harrington's republicanism was profoundly influential in the later seventeenth and eighteenth centuries. *Oceana* inspired a body of 'neo-Harringtonians', the True, Old, or Real Whigs, who provided a radical critique of England's monarchical polity, and later attacked the executive tyranny of prime ministerial and cabinet government. Harrington helped fuel assaults on standing armies, 'placemen' and irregular elections. Early examples are *Plato redivivus* (Plato Revived) (1680) by Harrington's friend Henry Neville, who also published an

edition of Machiavelli’s works; and *An Essay upon the Roman Government* (1698) by Walter Moyle. Toland published Harrington’s collected *Works* in 1700. Eighteenth-century political analysts, such as Bolingbroke and Hume, deployed the idea of ‘the balance of property’, although they rejected the republican utopianism. Harrington’s mark is also visible in some of the early constitutions of the American colonies, and among the rebels of 1776. It was said of General Warner, the hero of Bunker Hill, that ‘like Harrington he wrote, like Cicero he spoke, like Hampden he lived, like Wolfe he died’. In 1779 it was proposed, albeit ironically, that Massachusetts be renamed Oceana. In 1795 *Oceana* was republished in revolutionary France and the Abbé Sieyès drew up a Harringtonian constitutional plan. In the nineteenth century George Grote found inspiration in Harrington for his campaign for the secret ballot.

Hart, Herbert Lionel Adolphus (1907-93)

H.L.A. Hart, Professor of Jurisprudence at Oxford University, 1952-1968, is an outstanding representative of the analytical approach in jurisprudence and philosophy of law. He restated 'legal positivism' in the tradition of Jeremy Bentham and John Austin, differentiating between law's existence and its moral qualities. But he rejected the Benthamite identification of law with a sovereign's commands, advancing instead a theory of law as comprising a special, systematically organized, kind of social rules. He did this in a linguistic-analytical style, showing how attention to our way of speaking and thinking about rules can yield new insights into their nature.

Hart aimed to establish that legal obligation is intelligible in itself and yet conceptually distinct from moral obligation (see Law and morality §3). This depends on differentiating different types of rules in the legal setting, showing how some impose requirements upon conduct, while others confer power over rules of the former, 'primary' type. Legal obligations are imposed by 'primary rules', but since these can be varied through application of 'secondary' power-conferring rules, they can and do differ in content from moral obligations. He also argued for the possibility of a moral critique of law as it is, aimed at reforming it in favour of liberty and tolerance. His work here had important practical influence. He offered a distinctive account of rights, including human rights, and argued that a 'minimum content of natural law' is present in all viable forms of human social order (see Natural law §5).

The Concept of Law (1961), Hart's outstanding work, explains law as a system of social rules distinct from the rules and principles of morality, whether conventional or ideal. Legal rules divide into 'primary rules' laying down duties to act (for example, in pursuance of the terms of a contract) or to abstain (for example, to avoid harming others or attacking them in body or in reputation, or defrauding them) and 'secondary rules' relating in a systemic way to primary rules. Some secondary rules ('rules of adjudication') regulate the ways in which primary rules can be implemented through courts and other agencies. Others are 'rules of change', either enabling legislatures to secure large-scale legal changes, or enabling private persons to exercise powers under, for example, the law of contract, or property law, or trust law, so as to make changes in individual legal relationships.

Finally, there is the 'rule of recognition' containing the criteria for validity of primary rules and other secondary rules. A legal system thus comprises a rule of recognition and all the other rules valid by reference to it. The existence of a rule of recognition, and thus of the legal system, depends on human practice, especially the practices of officials. Acceptance of a common public standard under which all persons have an obligation to respect and apply laws that are valid by that standard is constitutive of the existence of a rule of recognition (see Legal concepts §3).

This framework also accounts for rights, the legal position held by those who are able to act in their own interest to activate or enforce duties laid upon others by law. Related kinds of right, also characterized by the law's deference to individual choice, are the liberties enjoyed by those who are not duty-bound to act in a certain way, or the powers conferred by 'rules of change', particularly those conferring private powers. This leaves open the question whether there are any 'natural' or 'human' rights. Hart's answer was hypothetical: if there are any rights that are a morally required part of any social order, the first and central of them must be the equal right of all humans to be free (see Rights §4). As for 'natural law', human nature makes restraints on violence and deception, and provision of some sort about possession of and access to material things, essential to the existence of any viable society. But this is not a detailed blueprint for either law or conventional morality, and hence does not justify a restricted definition of law that excludes from it any grossly unjust rules.

Law, Liberty and Morality (1963) was his own statement on the limits of law. He demanded that law be used only to prevent harm to others or for some restricted forms of 'paternalism' restraining people from severely self-harming activity (see Law, limits of §4). 'Positive morality', the conventional moral opinion of a community, is firmly differentiated from 'critical morality', rational and enlightened standards for criticizing or upholding norms of law or of positive morality. Hart rejected the use of law simply to enforce positive morality. *Punishment and Responsibility* (1968) was a collection of essays in which he developed a middle way between utilitarian and retributive principles of punishment, arguing that the latter ought to prevail in respect of distribution of punishments (only to those who deserve it, and in proportion to desert), while general deterrence remained the

justifying aim of the system (see Crime and punishment §2).

Causation in the Law (jointly with Tony Honoré, 1958) is an outstanding example of an effective combination of philosophical analysis and legal exposition, giving an account of the legally important idea of causality poised between common sense, science and law (see Causation). Hart's collected essays were published in two volumes (*Essays on Bentham*, 1982; *Essays in Jurisprudence and Philosophy*, 1983) one blue and one brown. If there was here an allusion to Wittgenstein's 'blue book' and 'brown book' it was not inapt; for Hart above all brought to jurisprudence the linguistic-philosophical insights of Wittgenstein, J.L. Austin and Ryle (see Ordinary language philosophy).

Hart's elucidation of rules involves a hermeneutic approach examining conduct 'from the internal point of view' of a group's members (see Legal hermeneutics). This owes much to Wittgenstein, and something also to Max Weber, but remains an original contribution to rule-analysis (see Norms, legal §2). Some critics have argued that one cannot start down this road without ending up in a fully 'natural law' approach. Others have argued that analysis of law purely in terms of conventional rules omits its essentially principled character, or that its sociological presuppositions are untenable. Hart's legal positivism, albeit highly persuasive, remains open to doubt.

Hartley, David (1705-1757)

David Hartley commands a distinctive place in Enlightenment thinking for his attempt to establish an empiricist epistemology upon a foundation of ontological materialism - in other words, a philosophy of mind that incorporates a physiology of the brain. He also set forth an optimistic vision of human progress which was nonetheless cast within the framework of a transcendental theology. Though his views might seem to be a singular fusion of disparate strands, they nevertheless epitomized much liberal and advanced English thinking of the time, and exercised considerable influence upon the philosophical radicalism of subsequent generations.

1 Life and contacts

David Hartley was born the son of a poor Anglican clergyman in Armley, Yorkshire, probably on 30 August 1705. Both his father and mother died while he was still a child. He attended Bradford Grammar School before matriculating at Jesus College, Cambridge, as a sizar at the age of seventeen, at precisely the moment when a thoroughly modern synthesis of Newtonian natural philosophjy and Lockean philosophy was becoming the staple of the undergraduate curriculum. He graduated BA in 1726 and MA three years later, and held a fellowship at the college from 1727 until he married in 1730.

As his writings show, Hartley was a devout Christian; yet scruples against signing the Thirty-Nine Articles precluded him from taking orders, and he chose medicine as a career. Apparently without any medical degree or licence, he began to practise in Newark, moving on to Bury St Edmunds. After his wife's death, he remarried in 1735, and his second wife's wealth enabled him to settle just off London's fashionable Leicester Square (then the physicians' quarter); subsequently her ill-health induced the couple to move to Bath, where Hartley built up a successful medical practice.

A Fellow of the Royal Society, Hartley was able to move in the best intellectual and scientific circles. His friends included the physician Sir Hans Sloane (who became president of the Royal Society), the Revd Stephen Hales, famous for his pioneering physiological experiments, the evangelical William Law, and Joseph Butler, the leading rational Anglican theologian. Hartley had a part to play in major intellectual and philanthropic causes of the day, championing smallpox inoculation and John Byrom's shorthand system, and writing pamphlets to secure a parliamentary subvention for Mrs Joanna Stephens' lithontriptic nostrum against kidney and bladder stones (he had suffered from the disorder while still a young man). He died in Bath on 28 August 1757.

2 Physiological philosophy

Hartley is best remembered for his *Observations on Man, His Frame, His Duty, and His Expectations*, published in 1749 - a two-volume philosophical *tour de force* that systematized views set out in his earlier *The Progress of Happiness Deduced From Reason* (1734) and *Conjecturae quaedam de sensu, motu, et idearum generatione* (1746). The *Observations on Man* offered a comprehensive vision of the individual considered both as an earthly being and in regard to a future state. Emphasizing the view that all knowledge derives from experience, it drew heavily upon the empiricist theory of mental operations explicated in John Locke's *Essay Concerning Human Understanding* (1690; see Locke, J.). It also absorbed the innovative associationist utilitarianism of the Revd John Gay's *Preliminary Dissertation Concerning the Fundamental Principle of Virtue or Morality* (1731), which set out a pleasure and pain psychology as the key to the formation of opinions and to the philosophy of action. Like Locke and Gay, Hartley sought to refute nativist theories of cognition and morality (see Nativism), insisting that complex ideas were built up from simple imputs by repeated combinations of what Hartley called the 'sensations of the soul'. Hartley thus grounded thoughts and values upon the Lockean principle of the association of ideas.

Unlike Locke and Gay, however, Hartley aimed to set these epistemological and psychological observations upon concrete physical foundations - the anatomy of the nervous system and the physiology of 'motions excited in the brain'. For this he drew upon the theory of sensation suggested in the 'Queries' to Isaac Newton's *Opticks* (1704; see Newton, I.). Newton had shown how light vibrated in a medium; such vibrations had an impact upon the retina; having impinged upon the eye, Hartley argued, these corpuscular motions set off further vibrating waves that passed along the nerves to the brain. The Lockean notion of the association of ideas was thus visualized and made material by Hartley in terms of reiterated vibrations in the white medullary matter of the brain and spinal cord,

which resulted in lasting traces or vestiges that served as the physical substrate of complex ideas, memory and dispositions. Unlike the French *philosophes* like La Mettrie, Hartley framed his materialist physiological psychology in terms of a Christian natural theology. In his view, materialism was not the slippery slope to atheism, precisely because it was the Christian God who, in His Wisdom, had endowed matter with all its powers and potentialities. The necessitarianism entailed by materialism was, in Hartley's opinion, the finest guarantee of the universal operation of cause and effect, hence of the uniformity of nature, and so of the boundless power of God.

As befitted a medical man, the first volume of *Observations on Man* explored major aspects of neurophysiology, discussing the human mind and appetites in terms of the evolution of complex ideas and habits from elementary sensations. Hartley demonstrated the formation of mental associations on the basis of the vibrations of particles in the nervous system which persisted in the form of the more minute 'vibratiuncles', which in turn provided the physical basis for memory, regarded in something of a rather Hobbesian way as decaying sense (see Hobbes, T.). Individual chapters explored the mental physics of feeling, taste, smell, seeing and hearing. The second volume extended the system to account for morality and the individual's prospects in a future state.

Unlike Stephen Hales, Hartley was less an experimenter than a systematizer, offering a comprehensive framework for interpreting the phenomena of life and mind. Among his followers, the *Observations on Man* came to be seen as the fountainhead of key biological, psychological and social doctrines. Hartley's tenets provided the framework for the associationist heritage in psychology - in particular, learning theory. His conjectures concerning the physiology of the nervous system offered suggestions for sensory-motor theories later influential in neurophysiology, and for the experimental localization of brain functions. Hartleian notions are the distant ancestors of Pavlovian notions of conditioned reflexes.

3 Influence

Hartley's particular neurophysiological theories proved erroneous, yet his work was of cardinal significance in the development of attempts to apply scientific concepts to the study of the individual as a social being and as a progressive creature. His was the first methodical elaboration of the explanatory principle (psychophysical parallelism) that came to play a role in the human sciences analogous to that played by the concept of gravity in the physical sciences. Though Hartley was personally devout, his unification of sensation, motion, association and volition within a mechanistic theory of consciousness and action created a framework of thinking that later supported more secular readings of the concepts of utility. His agenda was widely taken up in late Enlightenment and nineteenth-century doctrines as a means of accounting for cumulative ordered change through experience, changing responses being explained in terms of adaptation to pleasurable and painful consequences. Hartley put learning theory and moral judgment on a scientific basis.

Hartley had an influence on Samuel Taylor Coleridge, whose brief flirtation with his notions led to his first-born being baptised Hartley Coleridge. Joseph Priestley stressed Hartley's determinism, but omitted his materialist neurology in his edition of the *Observations on Man*, retitled [Hartley's] *Theory of the Human Mind* (1775). Priestley put his modified version of Hartley's theory at the service of a Unitarian philosophy of nature. Erasmus Darwin used Hartley's neurological mechanisms as the basis for his system of medical classification in *Zoonomia* (1794-6) and for his theory of evolution in the *Temple of Nature* (1803). In sociopolitical theory, the arguments advanced in William Godwin's *Political Justice* (1793) for inevitable human progress towards perfection were based on inferences from Hartley. The psychological, social, and political theories of James and John Stuart Mill and other English utilitarians were also based on Hartleian psychology and generalizations from it. In the nineteenth century, Hartley's fusion of corpuscular physics with empiricist epistemology and sensationalist psychology became reworked in more modern evolutionary terms to provide the foundations for theories in biology, neurophysiology, psychology, psychiatry, sociopolitical theory and to endorse a general faith in progress. Hartley's psychophysiological theory of learning underpins modern, evolutionary human science.

Hartmann, Karl Robert Eduard von (1842-1906)

Eduard von Hartmann was born in Berlin and lived there for most of his life. He was a prolific writer of both scholarly and popular works on a wide variety of topics, including aesthetics, ethics, religion and politics. He forecast a gloomy future for Germany, insisting that the only way to rectify the problems of modernity was with a strong nationalistic Germany ruled by an educated elite.

After distinguishing himself as a student Hartmann joined the military, intending to become an officer in the Prussian army. However, a severe knee injury frustrated these plans. During his convalescence he began a two-year study of music and painting. Believing he lacked the ’creative genius’ necessary for art he began an independent study of philosophy. In 1864 he began writing his best known work *Philosophie des Unbewußten (Philosophy of the Unconscious)*. When this three-volume work appeared in 1869, it made Hartmann an overnight success. Some ten thousand copies were sold between 1869 and 1875. The eleventh edition was published posthumously.Hartmann’s widow compiled a chronological overview of his writings with 400 entries. Hartmann died in Berlin.

Hartmann is perhaps best known as a philosophical pessimist, and is thus usually regarded as a disciple of Schopenhauer. Indeed Hartmann acknowledged that Schopenhauer exerted an early influence on his philosophical development. However, he insisted that he was a follower of Kant, whom he regarded as the true father of pessimism. Hartmann offered his own version of pessimism in his many writings, but perhaps the best statement of his position is found in his *Philosophie des Unbewußten*. Most of the first volume deals with Hartmann’s scientific and mathematical justifications for his belief that not only humans but all animals are prompted to actions by various unconscious motives; the ‘Will’ is the cause of everything that comes to be. He creditsKant with having discovered unconscious motives, but faults him for not having sufficiently appreciated the unconscious workings of the mind. In Hartmann’s view, Kant shared this deficiency with most of the figures in the history of philosophy.Schelling and Hegel barely improved uponKant’s philosophy. It was Schopenhauer who began to grasp the fundamental importance of the unconscious, what he called the ‘Will’. Unfortunately,Schopenhauer was too blinded by Eastern influences to appreciate sufficiently how the unconscious worked in the human realm. (ForHartmann’s view of his predecessors see the foreword to the tenth edition.)

There are, Hartmann maintained, three stages of the illusion regarding the state of happiness. In the first stage we believe that happiness is already attained in this life, yet there is far more pain than pleasure. In the second we believe that we will attain happiness in an afterlife. But happiness must be the concern of this life, and thus the second stage is a necessary transitional stage to the third stage, in which we believe in the progress of mankind. However, this concern with a future paradise on earth is also based on an illusion. Philosophical maturity comes in the realization that happiness is illusory.

Hartmann’s pessimism did not lead him to agree with Schopenhauer that this was the worst of all possible worlds; instead he thought thatLeibniz was actually closer to being correct in the belief that it was the best. However, he strongly rejectedLeibniz’s belief that we should consider evil to be a privation. Instead evil is manifest in this world. But it is part of the world’s teleological nature, the striving towards the final completion of the world, which means its utter and total annihilation. Again, despite some similarities with Schopenhauer,Hartmann believes that this outcome is not tragic. Rather, it is the culmination of the strivings of the unconscious through the entire human race - the end will be the highest expression of the unconscious in human nature.

Hartmann’s main debt is to Kant, whom he credits with emphasizing the subjective workings of the mind. According to Hartmann,Kant’s metaphysics and epistemology are primarily a doctrine of categories (see Kant, I. §6; Categories §3).Kant’s successors may claim to have continuedKant’s work, but Hartmann insists that his own philosophy represents the first major improvement onKant’s epistemology. In his *Kategorienlehre (Doctrine of Categories)* (1896a), Hartmann attempted to show that categories apply not only to the mind and nature but also essentially to what he called the ’metaphysical sphere’, that is, to the realm of the unconscious. He argued that there is not only intra-individual causality but also trans-individual causality, a kind of universal causality that organisms share at the biological level.

Hartmann sought to develop his theory of the unconscious and to apply it in many areas. Besides his attempt to reworkKant's categories, he also tried to build an ethics on his philosophy of the unconscious. He was also extremely interested in science, frequently using tables, graphs and calculations to illustrate his point. Yet he objected to the mechanical science of the day, occasionally singling out Darwin for special criticism.

He was, among other things, a historian of philosophy, a preoccupation he shared with many of his fellow nineteenth-century German philosophers. In his two-volume *Geschichte der Metaphysik (History of Metaphysics)* (1899-1900) he traced the role of metaphysics from the pre-Socratics to Nietzsche. He emphasized the place of metaphysics in the German philosophical tradition.

Hartmann's popularity waned immediately after his death, and today he is generally ignored. When he is remembered, it is primarily as one of the last of the nineteenth-century German speculative philosophers who sought to extend Kant's subjective philosophy by showing that our minds work not only at the conscious level but also at the unconscious level, thus prefiguring some aspects of modern psychology.

Hartmann, Nicolai (1882-1950)

Nicolai Hartmann's intellectual trajectory was similar to that of his contemporary, Heidegger. He abandoned his early Neo-Kantian concern with knowledge and its foundations in favour of 'ontology', a study of the being of entities. Unlike Heidegger he assigned no ontological priority to human beings. Human beings are the highest level of entities, perched precariously above the physical, organic and animal levels, but conferring meaning and value on an otherwise meaningless and Godless universe.

Hartmann was born in Riga and, after a period as a medical student, studied history, classics and philosophy at the university of Saint Petersburg. In 1905 he moved to Marburg, and gained a professorship there in 1920. He later held chairs successively at Cologne, Berlin and Göttingen, where he died. For some years he remained under the spell of the Neo-Kantians, Cohen and Natorp, but by 1921, he had awoken from his 'critical slumber'. He rejected transcendental idealism, the transcendental ego, the primacy of practical reason and many other Kantian doctrines (see Kant, I.; Neo-Kantianism). Knowledge does not produce or alter what is known. Epistemology is not, as some Neo-Kantians believed, the sole preoccupation of philosophy. We must also consider being, the being of the objects known and of the knower.

Hartmann did not reject Kantianism *in toto*. Philosophers have constructed systems and they have also tackled problems, often reaching conclusions at odds with their chosen system. Systems must be rejected; they belong to the past. But problems are eternal, and philosophers have made enduring contributions to their solution. One such contribution was Kant's belief that our experience involves categories (see Kant, I. §6). Kant inferred that categories are subjective, supplied by us to our experience and inapplicable to things in themselves. Hartmann rejects this inference. Categories are involved both in our cognition and in things in themselves. On this basis, Hartmann constructed an ontology.

Entities form a hierarchy of levels. At the lowest level are physical entities, involving such categories as extension and causality. Above these are plants, which involve organic categories. Then, various forms of animal life, requiring such categories as consciousness and purpose. Finally there are human being with their social and cultural products, which Hartmann, following Hegel, calls 'objectivized spirit'. These levels or regions of beings are related in such ways as these. Lower entities need not constitute higher entities. There are, for example, purely material entities forming no part of a plant, animal or human being. Conversely, a higher entity necessarily involves the lower levels and the corresponding categories. A human being consists of matter, is a self-maintaining organism in the way that a plant is, and shares the basic features of animals. A higher entity is not determined solely by the laws governing the lower entities on whose presence it depends; it has considerable free-play. An organism consists of matter, but not the same material particles throughout its life; it organizes the matter of which it successively consists according to biological laws that do not govern purely material entities. Humans have free will: their decisions are not undetermined, but determined by factors peculiar to their spiritual life, not by the laws governing matter, plants or animals.

There are values, but they do not (as Kant supposed) depend on the legislation of the rational will nor are they all encompassed by the moral 'ought'. They constitute a realm of objective essences, as do the truths of logic and mathematics, and can similarly be discovered a priori. Values form a complex hierarchical system, and the realization of higher values depends on the realization of lower values, that is, nonmoral values and rudimentary moral values. One cannot properly aspire to sainthood unless one first fulfils one's familial and civic duties. Values can conflict: appropriate action in specific situations requires a combination of different and often conflicting virtues. Hartmann explores the relations between the ancient and the Christian conceptions of virtue.

Values are not realized independently of human activity nor is there any providential power to guarantee their ultimate realization. The nonhuman world is devoid of value and 'sense'. If it were not, human freedom would be restricted. We could not realize values that are already realized or frustrate the realization of values the eventual triumph of which is assured by God. Efficient causality does not threaten freedom, since a causal system or sequence can be diverted by external intervention. But final or teleological causality undermines freedom. Hence Hartmann rejects attempts, theological or otherwise, to find value, meaning and purpose in the nonhuman world. The human being is free, and alone actualizes values, not only moral values, but also aesthetic. A work of art, like

any other entity, is primarily a material thing. In it the artist realizes aesthetic value as a sort of superstructure. Hartmann explored the ontology of the work of art, as well as several other 'regional ontologies'. The priority of persons in the realm of value does not correspond to their ontological position. We are latecomers, resting on more fundamental levels of being.

Hartmann's work has much in common with that of other twentieth-century German philosophers. He believed, like Scheler, in objective, non-formal values, and, like Heidegger, that being is prior to knowledge and that philosophy goes hand in hand with history of philosophy. There are, however, differences. Scheler and Heidegger saw themselves as revolutionaries, changing the direction of philosophy. For Hartmann philosophy steadily advances in the solution of perennial problems. Philosophy is to be pursued for its own sake, not - as Heidegger sometimes suggests - as a prelude to life or *Existenz*. The 'subject' has no such ontological priority for Hartmann as 'Dasein' does for Heidegger. Hence Hartmann proceeds from lower ontological levels to higher, not, as Heidegger does, from the higher to the lower. For example, 'real time' is the uniformly flowing time in which physical objects and events occur; 'experience-time', the time of human awareness and agency, is located within real time but does not determine its nature. Hartmann lacks Heidegger's interest in *being as such*. This coheres with his other views. Our conception of being needs no radical overhaul; he largely accepts traditional categories, such as reality and value. He gives no priority to the human being, who (on Heidegger's view) needs an overall understanding of being in order to make possible the encountering of particular beings. Nor is he tempted to ask 'Why is there anything at all?' or 'Why are we in a world?' It is enough to describe systematically the wealth of beings we encounter.

Hartmann lacked sympathy with existentialism, and with such of its precursors as Nietzsche and Kierkegaard - though he had a close affinity to Hegel. Hartmann is overshadowed by his competitors, but has significant merits: an encyclopedic range, dispassionate rigour of argument, clarity of thought and style, and single-minded devotion to philosophy.

Hasidism

Its name literally meaning pietism, Hasidism is a mystical renewal movement that originated in eastern Europe in the mid-eighteenth century. It has become one of the most important spiritual and social developments of Orthodox Judaism and has exerted an influence as well on non-Jews and Jews who are not Orthodox. Early Hasidic leaders claimed their spiritual authority on the basis of heavenly revelations and mystical awakenings. But they generally differed from the more esoterically minded Kabbalists, from whom they drew their earliest following, in seeking to present the fruits of mystical inspiration to the community. Hasidic teachings fostered specific spiritual and ritual innovations, which gave outward expression to the profound nexus that the Hasidic masters saw between mundane existence and the inner, mystical meaning of God's law. According to Hasidic thinking, the divine and the human formed a single, all-encompassing unity, and it was on this basis that the Hasidic rabbis found in acts of Jewish piety means of linking divine experience with human responsiveness. Notable for its vitality and continuity in diversity, Hasidism continues its influence on religious Jewry and beyond to the present day.

1 Hasidic thought

Hasidism arises out of the tendency of Kabbalistic leaders to claim charismatic authority and mystical inspiration (see Kabbalah). The early Hasidic figures used such claims to set out original ideas about God and worship. They established new patterns of leadership based on a sense of immediate connection with the divine presence and the central relevance of that presence to all aspects of life. The founder of Hasidism, Rabbi Israel Ben Eliezer (1698-1760), known as the Ba'al Shem Tov or by the acronym BESHT, drew his following from the eastern European circles devoted to the Lurianic Kabbalah, a tradition of esoteric mysticism, ascetic seclusion, spiritual devotion and reliance on the efficacy of ecstatic prayer. The spiritual life organized by these charismatic leaders was routinized in a social structure grounded upon mystical leadership but capable of profound impact on broad circles of followers. The Ba'al Shem Tov sought to bring a similar structure to a much wider public.

Hasidic thought rests on the assumption that all things in this world are imbued with divine vitality. A hidden core of divine essence sustains all outward existence. God is omnipresent and manifest in all dimensions of existence, permeating every human act, every thought, and every material object (see Omnipresence). Physical objects, seen in the light of the infinite, are illusory mantles, mere vessels for the divine presence (*shekhinah*). Reality, then, is a spiritual core enveloped by a physical exterior, a divine unity disguised within the multiplicity of corporeality. The linked but opposing visages of the internal and external - the hidden divine substance and its material manifestation - condition one another. For the divine essence cannot be revealed except in its corporeal manifestation, but material existence has no actuality without the sustaining divine essence.

The matrix from which Hasidic worship springs is this assumption that the divine essence (*'ayin* - literally, 'nothingness') preconditions every mundane and spiritual phenomenon (*yesh* - literally, 'being') and that beyond perceived reality (*yesh*) abides a hidden truth (*'ayin*). Reality, then, is a dialectical whole composed from being and nothingness, in which all things are united with their opposites and combined with their inversions. The opposing elements annihilate, garb, sustain, transform and change one another from being into nothingness and from nothingness into being. The fullest expression of each spiritual element resides within its manifestation through inversion. The truth of reality is the struggle to achieve this reversal, abstraction and restoration of each thing to its source.

Hasidism strives to establish a connection both with the hidden divine element which vitalizes manifest concrete reality and with the divine presence beyond the material garment. Thus the paramount demand of Hasidic worship is for constant realization of the overwhelming presence of the divine and the acknowledgement of the inherent unity of opposites. Hasidic literature reflects this interest and is replete with expressions indicating the contemplative consciousness to which the *hasid* (devotee) is to aspire: *devekut* (literally, 'cleaving') devotion in study and contemplation of the incongruity between the divine essentiality and its physical manifestation is sought through the perception of the spiritual inwardness that lines material reality. Such awareness can lead to ecstatic union with the divine presence. *Bittul hayesh* - nullification of existence - is contemplation of divine reality through its corporeal garment, stripping away corporeality. *Avoda be-gashmiut* - service in corporeality - is the daily obligation to illuminate the mundane with its hidden divine essence. *Ha'alat nizozot* - literally, 'raising

sparks' - is elevation of divine elements in one's consciousness in order to assess the true meaning of *yesh* and *'ayin*. All of these notions are adapted from the Kabbalah, but now qualified to accommodate the new theology.

2 The Hasidic ethos and worship

Hasidic efforts to achieve contemplative consciousness by abolishing sensory experience are called the subordination of the eyes of the flesh to the eyes of the intellect. The goal is realization of the ultimate unreality of material existence. Only the all-pervasive divine presence is ultimately real. Existence and nothingness are no longer determined by empirical criteria but through contemplation. The transformation of human consciousness implies an obligation to lay bare the divine in all things and discover the unity behind the specious multifariousness of appearances. The separate existence of all things in thought must be nullified. The ultimate goal is proximity to God.

To remove all encumbrances to awareness, Hasidism proposes an ethos based on equanimity, worldly abnegation, and 'the nullification of existence'. Human thought is at the forefront of the spiritual struggle, since its creative and transformative powers and its capabilities of unifying opposites mark it clearly as the divine element in man. Although amorphous in itself, thought has the divine power to penetrate to the truth of things and illuminate the consciousness concealed and imprisoned within tangible externalities, to remove the barriers separating the divine presence from human contact, and so, ultimately, to achieve union with God.

The spiritual impetus that Hasidism founded upon transformative thought brought about a renewed appraisal of the means and ends of spiritual activity. Spiritual ascension, for example, had been pursued by Kabbalistic practitioners through penitential mortification and the cultivation of lofty spiritual and moral virtues arranged on a mystical ladder that led to God. This scheme was now discarded in favour of direct contact with a divine omnipresence that was freely accessible to all. Hasidic theology demanded only that human consciousness be directed towards devotion to God and proximity to his presence through contemplation of the dual visage of existence.

Hasidic dialectical assumptions made the mystic's focus on the inner, spiritual dimensions of religious life into a matter of public, communal concern. As one popular Hasidic saying has it, 'Because God is present in every place and human thought is present in every place about which one thinks, every act, every time and every place can serve as the point of departure for every man's contemplation of the divine inwardness of reality that lies beyond its physical garments'. In the Hasidic idiom this claim is finely honed by the radical pietist slogan 'In all your ways, know Him'.

The most conspicuous conclusion that Hasidism draws from this thought is an expansion of worship to include the most mundane and secular actions, by virtue of the thought and intentionality that illuminate and accompany them. 'Worship through corporeality' means that any mundane act may become divine service, if performed with the proper intention. The sanctification of the mundane and the conversion of all aspects of life to divine service become core features of Hasidism. But these reflect the centrality of thought and intention in Hasidism. The claim for divine immanence and omnipresence, reiterated throughout Hasidic literature, entails an unfettered but also unbounded human obligation to seek and attain this immanence. Herein lies the deep conflict with the basic worldview of the Kabbalah. For not only is the Kabbalistic hierarchy denied but the very boundaries between heavenly and earthly existence are obliterated. The transcendental Godhead has been displaced by an immanent and accessible divinity, and the wall between esoteric and exoteric has been removed, allowing the attainment of divinity, in principle, by anyone (see God, concepts of).

These changes had far-reaching social ramifications. Worship now extends far beyond the realm of accepted convention and common Kabbalistic interpretation. The often conventional reliance on acts alone as a standard of religious commitment is displaced as intention and consciousness move to the fore. Further, the assumption that the divine presence is the core within all fosters a substantial expansion of the social circles for whom a spiritual life on the highest order is accessible. All is God, and God is everywhere. Everyone, without exception, should approach the divine in all possible ways. The Hasidic mystical leader and his community become counterparts, envisaged through the polarity of *yesh ve-'ayin*. Detailed guidance in the worship of God and a sense of guardianship for the individual and the whole Jewish people led to the formation of a new spiritual agenda and new social affinities.

Opposition to the Hasidic movement was not slow to appear, focused on principled reservations to the doctrine of immanence but also aware of the broader significances of that idea. Controversy, infighting, schism, social conflict, denunciations to the ruling authorities of Russia and Poland, and a mountain of polemic marked the spread of Hasidism. The controversy, like the Hasidic ideas themselves, can still be felt within the Orthodox Jewish community today. On the other hand, Hasidism proved to be a source of inspiration to such thinkers as Martin Buber.

The spiritual self perception of Hasidism is best represented in its voluminous homiletic literature, known as *Sifrut ha-Drush*, emerging in 1780 and continuing to the present. This literature shows the diversity and creativity of Hasidic mysticism and sheds light on its social ramifications. The major innovations of Hasidism are also represented in short tracts from the end of the eighteenth century, known as *Sifrut ha-Hanhagot*, which are abridgements of the homiletic literature. The controversial position of Hasidism is reflected in the polemical literature known as *Sifrut Hasidim ve-Mitnaggdim* and *Sifrut ha-Haskalah*, representing the controversies with Orthodox ‘Opponents’ of Hasidism on the one hand and with the exponents of the Jewish Enlightenment of the other (see Enlightenment, Jewish). The unique Hasidic social structure and the major role of the *Zaddik* (Hasidic mystical leader) are reflected in the Hasidic tale, a literary genre known as *Sifrut ha-Sipurim ha-Hasidit*.

Hayek, Friedrich August von (1899-1992)

An Austrian-born British economist who turned political philosopher, Hayek was best known for his critique of socialism and the modern welfare state. Writing as an avowed classical liberal (he repudiated the label 'conservative'), he attempted to develop his account of the market as a mechanism facilitating economic coordination into a more general theory of law and politics.

Hayek's liberalism was first formulated as a response to totalitarianism, which he regarded as a tendency manifest in the regimes of Nazi Germany and Stalinist Russia, and inherent in proposals for central planning in society. This was the basis of his early opposition to socialism and his theory of limited constitutional government under the rule of law. The development of his political thought, however, saw him become increasingly critical of government and its interventions in the spontaneous evolution of society. Society was a 'spontaneous order' and not the product of human design. The threat to this order or civilization came from mankind's mistaken confidence in reason's capacity to take control of social processes to shape society in accordance with particular ideals. Socialism, as well as proposals for social justice, he regarded as variants of this tendency, which he labelled 'constructivist rationalism'. This social philosophy was underpinned by a philosophy of science which emphasized the subjective character of the data of the social sciences.

1 Life

Coming from a distinguished Austrian family of scientists and academics (he was a cousin of Ludwig Wittgenstein), Hayek entered the University of Vienna after serving in the First World War. Graduating with doctorates in law (1921) and political science (1923), he became a legal consultant in the civil service and, later, director of the Austrian Institute for Business Cycle Research. After a period as *Privatdozent* in Political Economy at the University of Vienna, Hayek accepted an invitation to lecture at the London School of Economics in 1931, and subsequently was appointed Tooke Professor of Economic Science and Statistics.

In the 1930s Hayek engaged in several important controversies in monetary economics, capital theory and business cycle research, taking issue with John Maynard Keynes (§3) and Pierro Sraffa. He also played a leading role in debates over the possibility of economic calculation under socialism. With Ludwig von Mises, Hayek argued against economists such as Oskar Lange that, once prices in a market economy were recognized as carriers of information, it had to be conceded that central planning was impossible: command economies had no mechanisms for coordinating economic knowledge.

When he became a British citizen in 1938, Hayek's reputation as an economist rivalled that of Keynes. Yet it was the publication in 1944 of *The Road to Serfdom* that brought him to the attention of a wider public. Warning that economic planning would subvert the institutions of a free society, the book become a controversial bestseller and established Hayek's reputation as a critic of government economic intervention at a time when arguments for central planning were in the ascendant.

In 1950 Hayek moved to the University of Chicago as Professor of Social and Moral Sciences on the Committee on Social Thought. Most of the following decade was devoted to work on his political treatise, *The Constitution of Liberty* (1960), although he also published an important collection of the J.S.Mill-Harriet Taylor correspondence, and edited a collection of papers on *Capitalism and the Historians* (1954). In 1962 he retired from Chicago to the University of Freiburg and then, in 1967, to the University of Salzburg. In the 1970s he continued his work on the philosophy of law in his trilogy, *Law, Legislation and Liberty* (1973-9). Interest in his work revived following his award of the 1974 Nobel Prize for Economics. In the 1980s Hayek set out upon another ambitious project: a three-volume refutation of socialism. A single volume, *The Fatal Conceit: The Intellectual Error of Socialism*, appeared in 1989, three years before his death.

2 Economics and social philosophy

Hayek belonged to the Austrian school of economics. He studied under Friedrich von Wieser, but his work also bears the influence of Carl Menger and Ludwig von Mises. Hayek's economic theory offers a general account of economics as a coordination problem. The economic problem of society is not how to allocate given resources; it is, rather, 'how to secure the best use of resources known to any of the members of society, for ends whose relative

importance only these individuals know'. Hayek's theory of capital, and his work on trade cycles and on money, attempt to account for failures of economic coordination, particularly over time. He rejected Keynes' economics which, he thought, ignored the temporal structure of production and so did not properly comprehend how market processes facilitated economic coordination over time. More generally, he objected to neoclassical equilibrium analysis which, he held, conflated individual choice at one point in time with market processes over time. Such models made assumptions about the knowledge possessed by economic agents which it was the task of economics to uncover.

Methodologically, these views have their origin in the Austrian school's subjective theory of value, which holds that value, far from being an inherent property of any object, is conferred upon goods by the subjective preferences of agents. Austrians such as Mises thus concluded that economics was an a priori or apodictic science: economic laws were deductions from a few basic axioms about human action. Hayek, however, rejected the radical subjectivism implicit in this conception of economic theory. In 'Economics and Knowledge' (1937) he articulated an empirical conception of the nature of economics as a body of testable theories; yet at the same time he rejected general equilibrium models of analysis.

The problem with such models, he thought, was that they were unable to explain how equilibrium (or a state of coordination of different individual purposes) was achieved. This was because the theory of perfect competition at their core ignored the adjustment process required to reach equilibrium. The standard assumptions of economic theory accepted as given: (1) complete knowledge on the part of economic agents; (2) the absence of costs or restraints upon the movement of goods and prices; and (3) a homogeneous commodity being supplied and demanded by many sellers and buyers. These assumptions were untenable because the economic world was a world in motion - one in which the process of coordinating economic plans took place despite the ignorance of economic agents, the existence of transaction costs and the subjective character of the individual valuation of commodities. Hayek thus rejected Lionel Robbins' influential interpretation of economics as the science that studied the allocation of scarce means among competing ends. This view presumed something false: that knowledge of those means and ends was given.

At the heart of Hayek's economics is a view of the nature of knowledge. This has two important aspects. First, Hayek distinguished two kinds of knowledge: theoretical or articulated knowledge, and tacit or unarticulated knowledge. Theoretical knowledge exists in the form of explicit statements and is the product of conscious reflection. Tacit knowledge, however, is unarticulated; it exists in the skills, instincts and dispositions of individuals and is also embodied in institutions and practices. (This distinction encompasses Gilbert Ryle's distinction between 'knowing that' and 'knowing how'; see Ryle G..) Most knowledge, Hayek thought, was of the latter sort; and its existence was also, therefore, dependent upon context or local circumstances. Second, Hayek argued that much of human knowledge is not only dispersed but also, because it is unarticulated, is incapable of being collected.

This view had an important bearing upon Hayek's economic argument, particularly in the socialist calculation debates. Here Hayek extended Mises' analysis of the impossibility of rational calculation under socialism. Mises had criticized socialist economics for not recognizing that economic value was subjective. Valuation could only take place in terms of units, yet it was impossible that there should ever be a unit of subjective use-value for goods. Judgments of value did not measure but established grades or scales, and, in the exchange economy, the 'objective exchange-value' of commodities became the unit of economic calcuation. In a monetary exchange economy *money* was the good used as the unit in which exchange-values are defined. While the value of money might fluctuate as its value relative to other goods changed, monetary calculation enabled us to judge the relative values of all goods and so to make production plans over time.

Hayek accepted Mises' argument that, without a pricing mechanism (given the defects of calculation in terms of labour rather than money), there could be no economic calculation. He pressed this critique of socialist economics further, however, by arguing that the fundamental problem was not calculational but epistemological. In 'The Use of Knowledge in Society' (1945) he argued that the problem to be solved when seeking to construct a 'rational economic order' is not a logical problem to be overcome using all relevant information concerning preferences and the factors of production. The data from which economic calculus begins are never given complete to a single mind which could work out their implications. The nature of the problem of a rational economic order is:

'determined precisely by the fact that the knowledge of the circumstances of which we must make use never exists in concentrated or integrated form but solely as the dispersed bits of incomplete and frequently contradictory knowledge which all the separate individuals possess' (Hayek 1945) (see Socialism §2).

This division of knowledge Hayek thought to be the central problem of economics as a social science. However, investigating this problem meant moving away from the study of 'the economy' as a fixed domain marked by clear boundaries. Economies, in the strict sense in which households or enterprises can be called economies, consist of a complex of activities by which a given set of means is allocated in accordance with a unitary plan among the competing ends according to their relative importance. But the domain of human exchange encompasses not a single economy. What is commonly called a social or national economy is in fact a network of many economies. While such an order shares with an economy proper some formal characteristics, it does not share the most important one: its activities are not governed by a single hierarchy of ends. A better term for the extended order of human cooperation, Hayek suggests, is 'catallaxy': an order brought about by the mutual adjustment of many individual economies in a market. The task of economics is to investigate this order; but this also means that economics, ultimately, involves a more general investigation of social institutions.

Hayek's economics is therefore part of a larger social philosophy describing the extended order of society. The key to this account is his concept of 'spontaneous order'. For Hayek, an order is: 'a state of affairs in which a multiplicity of elements of various kinds are so related to each other that we may learn from our acquaintance with some spatial or temporal part of the whole to form correct expectations concerning the rest'. Order can be created by forces outside the system or it may be created from within as an equilibrium is generated by the interaction of elements whose natures impel them towards stable formations. This distinction is between an order that is 'made' and one that is formed spontaneously given the existence of particular elements in an environment. In the social world, the mind, language, law, and indeed society itself, should be understood as spontaneous orders.

In viewing society as a spontaneous order Hayek emphasizes that it is not the product of human design. While it is the result of human intention, it evolves without anyone controlling its development. This is partly because the knowledge possessed by any individual is so limited that no one could understand more than a fraction of the social environment. But it is also because not only society but also the individual is in a state of continuous evolution. Human nature - and mind and reason themselves - are not fixed but evolve with society (see Economics, philosophy of §3).

The important conclusion Hayek draws from this social philosophy is that individual reason is incapable of comprehending the social order in its entirety. Therefore, reason should not overreach itself by attempting to control or redirect the development of society. Such attempts would not only fail in their own terms but also threaten the progress of civilization, and the future evolution of reason itself. This concern about the 'abuse of reason' is the basis of Hayek's political philosophy.

3 Political philosophy

In his politics, Hayek defined himself as a classical liberal. He rejected socialism, but also denied that he was any sort of a conservative.

Hayek's liberalism stems from his social philosophy. His objection to socialism was that its aims, while noble, were unattainable. Its hope to bring about a planned society, organized in accordance with some common purpose, in which social forces were brought under human control, was in Hayek's view incapable of being fulfilled. The cost of the attempt, he argued, would be not only material impoverishment but also the gradual loss of individual liberty. The greatest danger to modern civilization came from the alliance of socialism with nationalism, which threatened to destroy the 'extended order of human cooperation' by drawing boundaries closing off societies in separate, controlled states.

Liberalism, for Hayek was a philosophy opposed to socialism and to nationalism. Its starting point was an understanding of society as a 'spontaneous' order. Any plausible answer to the question of what are the best social and political arrangements for human beings must be based upon this understanding. Hayek's answer is that human relations should be governed by arrangements which preserve liberty, with liberty understood as 'independence of the arbitrary will of another'. His political philosophy thus argues that a liberal society is one governed by the rule of law, and that justice is served only if law delimits the scope of individual freedom. In

short, liberalism favours a 'free' society in which individual conduct is regulated by rules of justice, so that all may pursue their own purposes in peace (see Liberalism §2).

The ideal of equality has a place in this scheme only in so far as Hayek concedes that the aim of the struggle for liberty has been equality before the law. Individual differences do not justify different treatment. However, this will inevitably lead to inequality in the actual positions people occupy and to material inequality. In Hayek's view, the state is not justified in using coercion to try to reduce or eliminate such inequalities. His objection is not to equality as such but to any attempt to impose a chosen pattern of distribution.

For the same reason, he objects to attempts to distribute goods according to 'merit' (see Desert and merit). If the principle of reward according to merit were institutionalized, we would end up with attempts to control remuneration which would in turn require even more controls upon human activity. For Hayek, this would not make for a free society since authority would decide what individuals were to do and how they were to do it.

The fear of this outcome is also the basis of his rejection of demands for equal distribution based upon membership of a particular community or nation. Membership of a national community does not, in Hayek's liberalism, confer entitlements to any share of national wealth. The result of recognizing any such entitlement would be that, rather than admit people to the advantages that living in their country offers, a nation will prefer to keep them out altogether.

In his early political writings, which include *The Road to Serfdom* and *The Constitution of Liberty*, Hayek argued that liberalism required a constitutional regime of limited government (see Constitutionalism §2). Government's essential function is to enforce the abstract rules of the society applying equally to all, although it is also charged with the task of preserving the market order. Beyond these, government also has a legitimate role to play in the administration of the resources of society to render some services to citizens, and also to provide a welfare safety net for the poor. It is not, however, any part of government's role to secure a particular distribution of income or wealth. This argument was developed at greater length in *The Mirage of Social Justice*, volume 2 of *Law, Legislation and Liberty*, which rejected the idea of social justice as not only unattainable but also 'meaningless'.

Yet while *The Constitution of Liberty* conceded a substantial - if limited - role for government in a constitutional regime, Hayek became progressively more critical of government as his political thinking developed. In *Law, Legislation and Liberty*, he began to criticize government's extensive legislative powers. This was an aspect of the development of his philosophy of law, which became increasingly critical of all forms of legal positivism (see Legal positivism). It also ushered in some interesting speculations about constitutional reform, although these sat uncomfortably with his growing scepticism about any kind of intervention in the spontaneous order of society by government.

This was the source of the fundamental difficulties in Hayek's political thought. As an intellectual who was genuinely concerned for the plight of post-war civilization, Hayek was a tireless advocate, arguing about the appropriate role of government and the conduct of policy. Yet his philosophical starting point was an emphasis upon human ignorance and the limits of reason, and the impossibility of humans controlling their social development. When, and for what reason, government could legitimately intervene in the processes of social evolution was thus difficult to establish.

Hayek's thought none the less is of interest as a liberal political philosophy. It is the most ambitious attempt in the twentieth century to develop a comprehensive liberal system of ideas. In its emphasis upon the danger of central control of knowledge, Hayek's thought also offers a liberalism whose core is strikingly postmodern.

Heaven

In Christian theology, heaven is both the dwelling place of God and the angels, and the place where all who are saved ultimately go after death and judgment to receive their eternal reward. The doctrine of the resurrection of the body requires that heaven be a place because it must contain the glorified bodies of the redeemed, but heaven is more theologically important as a state than as a place. This state is traditionally described as involving the most intimate union with God without the elimination of the individual human personality (the beatific vision); it is a state of perfect bliss beyond anything possible on earth. In high medieval theology, the happiness of heaven is understood to be so great that it is even beyond the capability of human nature to enjoy without divine aid. There are varying views on the nature of heavenly society, however, with some theologians (Augustine, Aquinas, Bonaventure) arguing that perfect happiness will be derived from the love of God alone, while others (for example, Giles of Rome) stress the joy that will be derived from the company of the elect. More recently, interest in the nature of heaven has declined, and Christian theology has tended to play down its importance.

1 Heaven in the Bible

The Hebrew word for heaven or the heavens (*samayim*) means ‘that which is above the earth’; in particular, it refers to that which is above the firmament (*raqia*). This, in the book of Genesis, is a solid vault in the visible sky holding back the waters beyond (Genesis 1: 8; Psalms 148: 4-6); it contains windows that open to let rain fall on the earth (Genesis 7: 11; 2 Kings 7: 2, 19), and the stars are suspended from it (Genesis 1: 14). The heavens are God’s handiwork, but are also the special domain of God himself. While it is vicious pride that leads human beings to attempt to reach heaven, as in the tower of Babel (Genesis 11: 1-9), the Hebrew tradition stresses the idea that while God is transcendent, he is also active in the history of his people and comes down repeatedly to intervene in human affairs; he is, in fact, omnipresent (Psalm 139: 8-10). In the New Testament, the ministry of Jesus begins with the heavens opening (Matthew 3: 16) in order that salvation might descend to earth. Christ returns to his Father in heaven (John 6: 62; 13: 1) and prepares a place for his followers (John 14: 3). The Ascension of Jesus into heaven (Mark 16: 19; Luke 24: 51; Acts 1: 9) led Christians to await the return of Christ, when both heaven and earth will be transformed (Isaiah 65: 17; Romans 8: 19-23; 2 Peter 3: 13; Revelation 21: 1). The Book of Revelation contains vivid imagery of resurrection, judgment and the City of God after the Second Coming.

2 Heaven in salvation history

In Hebrew thought, the belief that human beings were raised to heaven after death was not widespread. It was distinctive of Christian faith to interpret the crucifixion of Christ as a victory over death as well as over sin. Belief in a victory over death included not only belief in eternal life beyond the grave, but also belief in a resurrection of the body. This doctrine was predicated on the resurrection of Jesus from the tomb and was connected with the early Christian concern with the end of history and the expectation of the Second Coming (the *Parousia*); at this time, Christ would return in glory, the dead would be raised, all would be judged, and those who were saved would be taken to heaven to enjoy eternal glory. Heaven is therefore the culmination of salvation history. But it has always been a part of Christian belief that even before the general resurrection at least some of the redeemed will be with Christ, although in traditional Roman Catholic teaching some are detained for a time in purgatory. It is possible, then, to enjoy the glory of heaven without the resurrected body, so it must be a place/state for which bodies are not necessary. Still, Aquinas (§10) maintained that the enjoyment of heaven after the resurrection of the body will be greater than in the disembodied state. He argued that this must be the case because the operation of the soul united to a body is more perfect than the operation of the separated soul. Since happiness consists in an operation, he reasoned, the soul’s happiness after bodily reunion will be greater than before (*Summa theologiae* IIIa, q.93, a.1, corpus). Heavenly bliss is therefore enhanced by the union of the human soul with the resurrected body (see Eschatology §3).

Glorified bodies are said by Aquinas to have the qualities of impassibility, subtlety, agility and clarity (*Summa theologiae* IIIa, qq.82-5). Impassibility means that the glorified body does not suffer and does not need to preserve itself from wear or harm from within or without. Aquinas identifies subtlety with the power to penetrate. This was sometimes interpreted as the ability to pass through other bodies, but Aquinas identifies it with the perfect subjection of the body to the soul (*Summa theologiae* IIIa, q.83, a.1, corpus). Agility allows the glorified body to

move about unimpeded and with great rapidity. Clarity makes the glorified body luminous and brilliant to behold even to the non-glorified eye.

In Roman Catholic theology, there is no official position on the spatial characteristics of heaven or its relationship to the physical universe, in part because of the problem of explaining how it can be the abode of non-physical beings. However, some fundamentalist Christians interpret the Bible as referring to heaven as a physical place. The Latter Day Saints (Mormons) believe that the Second Coming will usher in a thousand-year reign of Jesus on earth which will involve the physical transformation of the planet into a Garden of Eden. This belief in a thousand-year reign after the Second Coming (millenarianism) has appeared from time to time in Christian history, in such groups as the Gnostics, the Montanists, the Anabaptists and the Pietists. Millenarianism never dominated the Christian tradition, but many theologians, including Aquinas, maintained that after the general resurrection and last judgment the earth will be transformed in a way analogous to the glorification of the human body (*Summa contra gentiles* IV, ch. 96). Since it was generally thought that the renewed earth would become part of heaven, it followed that heaven, or some part of heaven, has at least quasi-spatial features. On the other hand, Aquinas thought that the transformed physical universe will have no temporal features, but will be permanent and changeless. At the end of time, the earth and all heavenly bodies will stand still (*Summa theologiae* IIIa, q.91, a.2). Heaven itself is a static state to which nothing can be added and nothing taken away.

3 The beatific vision

The essential element in the state of heavenly glory is the beatific vision, which was defined by Aquinas as the intuitive vision of God in his essence. The idea is inspired by Paul: ‘We see now through a glass darkly, but then face to face’ (1 Corinthians 13: 12). This doctrine is theologically important because it indicates that the enjoyment of God in heaven is not only a historical end, or the aim of the divine plan of human salvation, but constitutes the fulfilment of the nature of each individual human person. Adopting Aristotle’s teleological view of nature, Aquinas describes human beings as incomplete and in a state of movement towards an end that fulfils that for which they were designed. Like Aristotle (§21), Aquinas identifies the end of human life as happiness; happiness is what human beings by nature desire. But unlike Aristotle, Aquinas maintains that true happiness is not possible in this life (*Summa theologiae* IaIIae, q.5, a.3). He interprets the desire for happiness as a natural but obscure awareness in each human person that their goal is union with the supreme good. Since the supreme good is God, it follows that there is a natural but obscure desire for union with God, and this union is the supernatural end for which every human being was created. Aquinas thus combines Aristotelian metaphysics with the Christian theology of Augustine (§11), whose famous prayer ‘Our hearts are restless until they rest in thee, oh Lord’ expresses the failure of the fulfilment of human desires in this life.

The doctrine of the beatific vision raises interesting questions about the nature and limits of human knowledge. Aquinas was clearly concerned with the problem of whether a finite created being can actually know an uncreated infinite deity. He decided that it is beyond the nature of created beings to do so, but supernatural help enhances the human and angelic intellects to make this possible. Aquinas calls this aid ‘illumination’. In the beatific vision, Aquinas says, God himself is in direct contact with the human mind; this contact is not via images or concepts, which are the only ways human beings can have knowledge otherwise (*Summa theologiae* IIIa, q.92, a.1). As infinite truth, God alone is able to satisfy fully the human and angelic intellects, which are made for the possession of truth. As infinitely desirable, God alone is able to satisfy the desires of the human heart or the angelic will. The end for which human beings were created is thus a gratuitous gift of God, one which is fully satisfying, but which human beings would be incapable of enjoying without supernatural aid. The blessed in heaven will not all enjoy the beatific vision in equal measure, however. There will be degrees of happiness and union with God corresponding to the degrees of merit of persons at death (*Summa theologiae* IIIa, q.93, a.2-3).

The secondary object of the beatific vision is our continuing knowledge of the beings and events of creation. These will be known through the vision of the divine essence in whom all things are known. This raises a series of questions about the importance of contingent relationships to human happiness. Since human beings in heaven are self-conscious egos, it is reasonable to think that they do not lose their memories of the past or their attachment to particular persons. But what if certain persons loved while on earth are absent from heaven? Aquinas says that no unhappiness would result from this, since all delight is in God and in God there can be no attachment to evil or to evil persons. But as long as it is admitted that there is enjoyment in the company of the elect, it is reasonable to

think that there would have been greater delight had certain loved ones been saved. Furthermore, it is difficult to believe that the blessed in heaven would want to observe the sufferings of the damned. Yet Aquinas not only maintains that they do, but that this enhances their bliss:

> Everything is known the more for being compared with its contrary…. Therefore in order that the happiness of the saints may be more delightful to them and that they may render more copious thanks to God for it, they are allowed to see perfectly the sufferings of the damned.
>
> (*Summa theologiae* IIIa, q.94, a.1, corpus)

4 The society of heaven

McDannell and Lang (1988) raise the problem of how happiness deriving from the particularity of human relationships is related to happiness deriving from the vision of God. They claim that there are two strands in the history of the idea of heaven in Christian thought, one theocentric and one anthropocentric, and that the two are in tension with each other. The dominant theocentric strand either ignores or at least downgrades social joys in heaven. Bonaventure, like Augustine, rejected any idea of individualized friendships in heaven. Likewise, Aquinas says that there will be no sexual love or enjoyment of food in heaven (*Summa contra gentiles*, ch. 83) - a view contrasting with the Islamic heaven - and that friendship is not necessary for perfect happiness: ‘But if we speak of perfect Happiness which will be in our heavenly Fatherland, the fellowship of friends is not essential to Happiness, since man has the entire fullness of his perfection in God’ (*Summa theologiae* IaIIae, q.4, a.8). Aquinas implies, though, that while the love of friends is unnecessary, it will still exist as derived from the love of God: ‘And so if there were but one soul enjoying God, it would be happy, though having no neighbour to love. But supposing one neighbour to be there, love of him results from love of God’ (*Summa theologiae* IaIIae, q.4, a.8, ad.3).

The other strand identified by McDannell and Lang emphasizes the joy of the company of the elect. This strand has appeared from time to time throughout the Christian era. While Aquinas was somewhat reticent about the extent of social life in heaven, his student Giles of Rome was not, and he speculated that the saints form a heavenly *societas perfecta*. During the nineteenth century, a conception of heaven as full of earthly delights, including all the pleasures of social relations, replaced the theocentric conception in the popular imagination and represented the apex of the anthropocentric view of heaven. Although this conception of heaven has largely been discarded in theology (with the exception of Mormon theology), it has not usually been replaced by a well-developed theocentric theology. With a few exceptions (for example, Hick 1976), heaven is not a significant topic in contemporary theology. Occasionally, however, some interesting new problems about heaven have been raised. Examples are the problem as to whether the unchangeability of heaven would make it boring, and the problem of there seeming to be a significant amount of luck involved in getting there. This is because part of what gets a person to heaven is what one does during life, but what one does during life is partly determined by such things as the kind of upbringing one has, the circumstances in which one makes choices, and even the timing of one’s death (see Zagzebski 1994). There is also, of course, the traditional dispute over predestination (see Predestination).

5 The decline of heaven in contemporary theology

There has been a decline of interest in Christian theology regarding what were traditionally called the ‘last things’: death, judgment, the resurrection of the body, and heaven and hell. In the Roman Catholic Church, this may be partly due to embarrassment over the centuries of teaching the faithful to accept their lot in life, no matter how poor, on the grounds that the important thing was the next life. Heaven is mentioned only briefly in the documents of Vatican II, and the influential Jesuit theologian Karl Rahner said late in life that we have but one life and no continued existence after death (1975). Liberal Protestant theologians have little to say about heaven, and when it is mentioned, it is usually described in minimalist terms as a state which concerns our contact with God in the afterlife. There has been more speculation on the existence of hell; and since the traditional theology of heaven is the counterpart to the theology of hell (the former being associated with reward and the latter with punishment) changes in the conception of the latter will require some changes in the former.

The focus of the problems is the doctrine of an eternal heaven and hell, particularly the latter.)

Heaven, Indian conceptions of

*Heaven is an important part of Indian religious cosmology and also figures strongly in Indian philosophical discourse. In the cosmologies of the early period of Indian thought, from the Ṛg Veda to the advent of the so-called heterodox schools of Jainism and Buddhism (*c.*1500-500 BC), heaven was conceived of in relatively simple terms, as a happy and permanent abode for both the deceased (particularly those who performed Vedic sacrifices) and the gods. In all three of the major religious systems of classical India, namely Hinduism, Buddhism and Jainism, heavenly realms expanded in number, and were usually depicted in terms of the deities who inhabited them and the prevailing life-situations of the deceased. Geographically, the heavens of classical India were envisaged as either parallel, occupying separate, bounded, horizontal space, or vertical, existing on separate tiers of upper-level space. Philosophically, the existence and soteriological value of heaven were much debated, from the earliest Upaniṣads (*c.*500 BC) and philosophical* sūtras *of Vedānta and Pūrva Mīmāṃsā (the Brahmasūtra of Bādarāyaṇa and the Mīmāṃsāsūtra of Jaimini respectively) to the later logicians and systematizers of the standard philosophical systems (*c.*1500 and beyond). Religion and philosophy were always intimately linked in India, indeed were often barely distinguishable; thus the soteriology of a religious form would be logically supported and fully explicated by allied philosophical schools. Broadly, two points of view were represented: first, that heavenly realms did exist and were achievable for one's ultimate benefit, or, second, that they existed but were phenomena subject to decay, rather like ordinary reality, or (as the Buddhists thought) were mental constructs. In the second case, heaven was regarded as inferior to variously conceived states of enlightenment or liberation.*

1 Heaven in the Vedas

In the religious and philosophical schools of India, notions and descriptions of heaven follow one of two paths: heavens are either permanent abodes of bliss and happiness based on earthly models, or they are (along with various hells) temporary states where good (or bad) karma (Pāli, *kamma*) is consumed during an all-but-eternal cycle of births and deaths (*saṃsāra*). In the Vedas and most of the religious and philosophical traditions that follow in their wake, the word that comes closest to 'heaven' is *svarga*, from *s(u)var* ('light', 'the sun', 'the realm of celestial light') and *ga*, from the Sanskrit verbal root *gam* ('to go'). Thus the etymological meaning of *svarga* is 'going to the realm of celestial light' (see Gonda 1966: 73-106). Other words are used occasionally in post-Vedic literature, such as *devaloka* or *devālaya*, 'the realm (or abode) of the gods'. *Svarga*, more explicitly, was an abode of religious merit identified with the celestial counterpart of the Vedic sacrificial ritual, located in the highest part of the vault which comprised the tripartite Vedic universe: the earth, mid-region and celestium. *Svarga* was a ritually replicated embodiment of 'Vedic man's desire to live in a pure, strong and perfect "sphere" or "world"' (Gonda 1966: 73). It was connected to this world not just ideologically but physically. The *Ṛg Veda* (10.90.3-4) states that three feet of the archetypal cosmic being (*puruṣa*) obtain immortality in the divine celestium (*amṛtaṃ divi*), while the fourth foot 'is all beings'. This inspired the common Indian trope of the inverted tree, with its many roots in the sky and its leaves on earth, an image which envisages a connection of the world of the gods and the deceased with that of humanity (see Coomaraswamy 1938-9).

In order to grasp fully the significance of the idea of heaven in ancient and classical India, it is important to understand at least the broad outlines of the metaphorical uses of *svar* and *svarga* in the earliest Vedic texts. In the *Ṛg Veda* itself (7.90.6), the patrons of the sacrifice bring *svar*, 'celestial light', to the poets, presumed to take the form of worldly payment for services rendered. Gonda concludes: 'The ideas of sun, sunlight, celestial light are inextricably mixed up with those of well-being, good fortune, happiness, glory' (Gonda 1966: 78; see also Kirfel 1967: 22-).

Svarga is often thought of as the 'yonder world' to which the ritually perfected Vedic sacrificer travels after death to live in a state of happiness or bliss. It is the ultimate abode of the one 'who knows thus', the one who has acquired the esoteric meaning or connections of ritual performance. It is important to understand that this is not just armchair speculation or meditative cognition: ritual action and intent were considered essential to realizing and entering into the celestial region. This 'yonder world' was often identified as both the realm of the gods (*devalokaḥ*) and the realm of the deceased ancestors (*pitṛlokaḥ*), though these were just as often distinguished. *Svarga* was variously described as infinite (*ananta*), immeasurable (*aparimita*), undefined (*anirukta*), whole or complete (*sarva*, hence also identified with the year), immortal (*amṛta*), and as the sacrifice itself (*svargo vai loko*

yajñaḥ, Kauṣītaki Brāhmaṇa 14.1). It was thus every bit as much an abstraction or symbol, an ideal of earthly life, as a paradisiacal abode of the dead. Indeed, the Vedas do not contain florid descriptions of *svarga*. It is merely described as full of pleasures and resplendent. Occasionally it is said to be in the east or northeast; 'up from the earth', according to two Vedic texts (Aitareya Brāhmaṇa 7.5, Śatapatha Brāhmaṇa 3.5.1.9). It is difficult to attain. One mounts or ascends to *svarga* as if on a chariot or ship. 'Becoming a hawk one flies to it' (Taittirīya Saṃhitā (5.4.11.1). The sacrifice, as a ship, was oriented towards the east, for when the priest 'walks towards the east, he steers that [ship] eastward toward the heavenly realm [*svargaṃ lokam*]. By this he attains the heavenly realm' (Śatapatha Brāhmaṇa 2.3.3.16). Similarly, the eastern sacrificial fire (*āhavanīya*) is regarded as the world of heaven, so the sacrificer who is anointed near the *āhavanīya* attains this realm (Śatapatha Brāhmaṇa 9.3.4.11-13). Often *svarga* is associated with Brahman, which in the middle Vedic literature indicates the power of expansion that expresses all things superior in the Vedic universe. Thus this heavenly realm has both geographical and existential status: it is both 'a soteriological "world of heaven" (*svarga loka*) and a cosmological "world of the sky" (*svar*, *dyaus*)' (Smith 1994: 127).

2 Heaven in classical Indian religious systems

Heavenly or celestial realms multiply dramatically - they expand vertically as well as horizontally, which is to say they are multi-tiered and parallel - and receive much more detailed treatment in Jainism and Buddhism than in the Vedic literature, as well as in the Purāṇas and the Hindu *bhakti* traditions that grew out of it and which continue to dominate the Indian religious landscape. Much of the discourse on heaven is intimately connected with notions of karma and retribution. The general rule is that if one performs good actions, one attains a pleasant celestial abode, pleasant in a measure corresponding to the merit accruing from the good actions; but the abode can equally be destructive or frightening as a result of an overflow of bad actions. For example, the Buddhist cosmologies speak of pleasant heavenly realms of sensual pleasures, called *kāmadhātu*; realms in which gods are liberated from sensuality, called *rūpadhātu*; immaterial realms in which one may continue spiritual work, called *arūpyadhātu*; the abode of the 'satisfied' Bodhisattvas, called *tuṣita*; and finally the 'happy universe' or 'pure land', *sukhāvatī*, where blissful creatures are born from lotuses in the presence of the Buddha Amitābha, Avalokiteśvara and certain Bodhisattvas (La Vallée Poussin 1926; see also Hirakawa 1990: 170-; Kirfel 1967: 190-).

The Hindu Purāṇas have, in theory at least, five characteristic features (*pañcalakṣaṇa*), one of which is describing the knowledge of the cosmos (*sarga*, 'the creation'). Included in this cosmology are various heavenly realms (usually seven), which are usually ideal and paradigmatic, and mappable according to both physical, social and mythic notions, and ideas of psychological symmetry, order and justice. One of the common images (not always satisfactorily mapped) is the descent of the Ganges (and other rivers) from heaven. The Ganges, an artery of celestial water, connects the world of humans and the comparatively proximate world of the dead (*pitṛloka*) with the heavenly fountainhead of the gods. Thus, immersion of physical remains in rivers, especially the Ganges, connects the deceased (and the consequent offerings to them by the living) with the higher realms (see Witzel 1984; von Stietencron 1972; Lüders 1951: 138-61, 269-193; Kirfel 1967: 59-, 109-). Heavenly worlds in Jainism are every bit as elaborate as their Hindu and Buddhist counterparts, are equally dependent on notions of karma produced, and are populated by several levels of gods and exalted beings (see Kirfel 1967: 285-; Caillat and Kumar 1981).

Despite their splendour, these higher or heavenly worlds are, in post-Vedic India, almost invariably regarded as impermanent, subject to decay. Indeed, perhaps the most prominent feature of heavenly worlds, at least for Indian philosophical schools, is their ambiguity. The virtue which leads to residence in them and the rewards resulting from such residence are decidedly transitory, yet they represent progress towards emancipation. But it is a peculiar kind of progress, in that it that can be fully realized only when the denizens of heaven, from ordinary mortal souls to the highest of the gods, take rebirth once again in human form. On the whole, the philosophical schools recognize heaven as a reward of properly intended and performed ritual action, action performed for the explicit purpose of otherworldly reward. But as the merit and the corresponding participation in such worlds become exhausted, heavenly beings begin to lose their lustre in preparation for a fall. But the fall is deceptive: although it is a fall from certainty and near immortality in pleasant realms into the uncertainty and suffering of this mortal world, it is necessary and in the interest of the highest good because final liberating knowledge and experience can only be gained from decisively confronting the visage of mortality.

3 Heaven in philosophical thought

In India, philosophy was almost invariably a handmaiden of religious doctrine. Thus, heaven, which was intimately associated with specific religious doctrines, became a point of contention in sectarian and inter-religious debate. In general, the classical schools of Indian philosophy argued against the ultimate value of the Vedic notion of heaven, a place to which deserving humans or even sacrificed animals ascended after death, regarding it as limiting and therefore inferior to the 'higher' goal of spiritual emancipation. Regardless, philosophers regularly appealed in establishing the truth of their respective positions to the authority or verbal testimony (*śabdapramāṇa*) of *Śruti*, which indicated either the Vedic corpus vaguely or the Upaniṣads specifically. The first question considered by the philosophical schools was the very existence of heaven. This question was taken up because heaven is invisible and must therefore be proved to exist (the Cārvāka, or atheist, school declared that it is invisible and thus nonexistent). To this end the philosophers resorted to the authority of scripture. For example, Uddyotakara (a sixth-century logician) says in his *Nyāyavārttika* that, based on descriptions in Vedic texts, heaven and the gods are perceptible, have specific location and exist for the sake of others, but are not eternal (see Potter 1977: 311). He declares that the Veda aims at heaven through ritual means, while self-knowledge can be attained only through understanding of the ontological categories presented in Nyāya-Vaiśeṣika, including, among others, the nature of substances, wholes, parts and proper reasoning (see Nyāya-Vaiśeṣika §§4-5).

The philosophical system that most naturally defends the Vedic notion of heaven is Pūrva Mīmāṃsā (see Mīmāṃsā). Śabara (*c.* second century AD) states in his commentary on Jaimini's *Mīmāṃsāsūtra* (6.1.1, *c.* second-third century BC) that *svarga* is a form of happiness, because that is the way people describe it. Only in a 'secondary figurative sense', he says, is it 'applied to the thing or substance that causes happiness' (Jha 1942: 270). It is a condition in which one is devoid of pain and in which the self alone is the object of consciousness. It is also, according to Pūrva Mīmāṃsā, the result of a desire that is fulfilled by ritual action. The connection between sacrificial action and later residence in heaven is established by the later philosophers of Pūrva Mīmāṃsā (beginning with Kumārila, seventh century) by the assumption of *apūrva*, 'a potency produced by the sacrifice which makes it possible that its fruits be reaped at a later time; it is a bridge between the actions and their promised results' (Halbfass 1980: 275).

The notion of desire, however, which most of the philosophical traditions associate with popular religion, is generally rejected as a causal factor in the acquisition of the highest state of existence. Most of the philosophical schools regard as naïve both the Vedic notion of heaven and the correlative notion of desire as a means to attain it, and replace them with more systematic paradigms of liberation and proper understanding of reality, usually accompanied with programmatic spiritual practice. Indeed, desire and sacrifice come to be regarded as antithetical to the 'higher' goal of enlightenment (*mokṣa*, *mukti*). The major (but partial) exceptions to this are some of the devotionally based schools of Vedānta, including, for example, the Śuddhādvaita of Vallabhācārya (1479-1531), in which passionate attachment to Kṛṣṇa, to be sure a form of desire, can lead to final residence and near partnership in the archetypal realm of Kṛṣṇa's creative matrix. Vallabhācārya regards this blissful condition as superior to the state of enlightenment in which the individual self is absorbed into the abstract absolute (see Vedānta §3).

One example of the classical Advaita Vedānta position is found in Śaōkara's (early eighth century) commentary on Bṛhadāraṇyaka Upaniṣad 3.2-3, which discusses the question 'What is this "death" that the liberated man is freed from?' Śaōkara concludes, against the views of his (rather unfairly represented) Pūrva Mīmāṃsā (opponent, that ritual action cannot lead to liberation but only to heaven, that residence in heaven is not possible after the body has returned to its constituent elements after death, that dissolution cannot result in abidance in any 'state'. Indeed, liberation is characterized by destruction of ignorance (*avidyā*), the underlying cause of the world, and this is only possible through proper understanding of the relationship between the self and the absolute. And, he adds, it does not require dissolution of the physical body (see Śaōkara).

One final position may be mentioned here which allows for both the Pūrva Mīmāṃsā (and the Vedānta views. This is the view of the grammarians (*vaiyākaraṇāḥ*). Nāgeśa (seventeenth century) states in his commentary on Kaiyaṭa's *Pradīpa* on the *Mahābhāṣya* of Patañjali (second century BC) that the study of grammar is useful for the attainment of both *svarga* and *mokṣa*; it results in correct understanding of Vedic texts, which enables one to perform rituals properly, leading to *svarga*, while it is also useful for understanding the Upaniṣads, which lead to *mokṣa*.

Hedonism

Hedonism is the doctrine that pleasure is the good. It was important in ancient discussions, and many positions were taken, from the view that pleasure is to be avoided to the view that immediate bodily pleasure is to be sought. More elevated views of pleasure were also taken, and have been revived in modern times. There are three varieties of hedonism. Psychological hedonists hold that we can pursue only pleasure; evaluative hedonists that pleasure is what we ought to pursue; reflective hedonists that it is what on reflection gives value to any pursuit. Arguments for psychological hedonism suggest that an agent's actions are a function of what they think will maximize their pleasure overall. Explaining altruism can lead such theories into truism. Similar arguments are used for reflective hedonism, and the same problem arises. The difficulty for evaluative hedonism lies in deciding how we can establish certain ends as desirable. The claim that pleasure is to be maximized seems immoral to many. Hedonism also faces problems with the measurement of pleasure.

1 History and varieties of hedonism

Hedonism is the doctrine that pleasure is the good (see Pleasure; Good, theories of the). It has usually been viewed as a doctrine of self-indulgence, and so morally suspect. In classical Greece the pre-philosophical picture of pleasure is given in the Myth of Prodicus, where Pleasure vies with Virtue in tempting Hercules. Among philosophers, some advocated pursuit of immediate bodily pleasures (see Cyrenaics); some, hoping to show disreputable pleasures to be detrimental to overall pleasure, took the maximization of pleasure over one's life as the good (their hope is helped if non-bodily pleasures are included) (see Democritus; Protagoras); some (such as Plato in *Republic* and Aristotle in *Nicomachean Ethics*) held that at least the good life is the pleasantest, and perhaps that, if you understood about pleasure, arguing from hedonistic premises would lead you to the morally right conclusion (see Plato; Aristotle); some held that pleasure is to be avoided (see Cynics). After Aristotle, Epicurus and his followers advocated a life of physical pleasure unadulterated by pain, and of unanxious memory and anticipation of such pleasures. For a number of centuries they were an influential school. The Stoics, by contrast, considered pleasure to be a false belief in the agent's wellbeing (see Stoicism).

In the Middle Ages the topic did not arouse such excitement, although it was treated in commentaries on Aristotle. In post-Cartesian philosophy Claude-Adrien Helvetius was a proponent, and many of the British empiricists adopted some form of hedonism. This was developed into utilitarianism by Jeremy Bentham, James Mill and John Stuart Mill (see Utilitarianism). J.S. Mill (1861) distinguished higher from lower pleasures, declaring the former, more admirable, pleasures pleasanter. Hedonism received judicious consideration from Henry Sidgwick and was vigorously attacked by G.E. Moore, but has benefited from sophisticated development at the hands of Richard Brandt (1979).

Psychological hedonists hold that we can pursue only pleasure; evaluative hedonists that pleasure is what we ought to pursue; reflective hedonists that it is what on reflection gives value to any pursuit. Some have tried to be all three at once, usually through failure to notice the differences. The varieties of hedonism in the first paragraph above will match with types in these three to produce different forms of hedonism. Further variations may be introduced as follows: (a) while the pleasure in question is usually the agent's own, it may be that of any human or sentient being (see Animals and ethics); (b) different views of the nature of pleasure will yield different pictures of the goal in life (see Eudaimonia). For example, if pleasure is the realization of one's own good functioning, we get one picture (see Perfectionism); if it is the satisfaction of desire, another (see Desire).

2 Psychological, evaluative and reflective hedonism

Whether this distinction holds depends on conclusions about the distinction between fact and value (see Fact/value distinction). In classical Greek philosophy it was standard practice to argue from the supposed fact that something is the only thing wanted (or really wanted) by an individual or species, to the conclusion that it is the good of that individual or species. To show that everyone wants only pleasure was thought necessary and sufficient to show that pleasure is the human good, and so what humans ought to pursue. If it is invalid to argue from facts about what people do want to conclusions about what they ought to want, then there will be a clear difference between holding that we all do want pleasure and holding that we ought to. Indeed, it will be a waste of time telling people that they ought to want pleasure if pleasure is the only thing they are capable of wanting. Proponents of evaluative

hedonism seem to suppose the falsity of the psychological variety.

Reflective hedonism is a halfway house. The thesis is that when we reflect on what is valuable in life, then only considerations of pleasure weigh; but in many of our pursuits we lose sight of this. Thus I may become overconscientious and in all my actions be ruled by considerations of duty; when I stand back and review my life, it is its dreary lack of pleasure which convinces me that it is all worthless. This is a psychological thesis about our reflective valuing which allows us to make sense of raising questions about the worth of what we actually pursue.

3 Arguments for hedonism

(a) Psychological hedonism. Arguments may be to the effect that all of every agent’s actions are a function of what they consider will maximize their pleasure overall, or will be the pleasantest thing in itself of the available alternatives. It will depend on how the end of pleasure is conceived. Apparent exceptions, such as altruistic acts, will have to be shown nevertheless to be a function of the goal as specified. Two points are important here. First, suggesting a way in which an agent might see an act as maximizing pleasure is not showing that they do: hypotheses have to be substantiated. Second, showing that an act is a function of what the agent thinks the most titillating in prospect of the available alternatives is not showing it to be a function of what they think will maximize pleasure overall. In other words, one has to ensure that one has evidence for the hypothesis, and to be sufficiently precise about its formulation to be sure that the evidence tells in favour of it and not some other view.

Faced with apparent counterexamples, such as altruism, there is a temptation to claim that if the agent does not envisage some pleasure from their altruism, or view it with pleasure, then they do not really want to act as they do. This saves the thesis but at the cost of making it truistic; pleasure can no longer illuminate why we desire anything: if pleasure is absent we do not count as desiring.

In these arguments, not only is it important to beware the slide into making the thesis truistic; one must also take care about the relations between various explanations in terms of pleasure. If I am depressed, I may recoil from the prospect of going to a party which I know I should enjoy if I made the effort. Evidence about what I view with pleasure does not seem relevant to the question of what I think will produce pleasure, or conversely. It is necessary to argue the connection.

(b) Evaluative hedonism. The issue here depends on the possibilities for establishing the desirability of ends. Is it intuitively obvious that in some sense pleasure is (the) good? Or by some account of rationality is it the only rational thing to pursue? Or does pleasure alone make sense of our moral concerns? The argument is not now about actual pursuits, nor about what counts as wanting, but about how one might argue that pleasure ought to be pursued or desired.

(c) Reflective hedonism. Points paralleling those on psychological hedonism hold. First, there are arguments as to whether all our reflective valuing does in the last resort rely on appeal to hedonistic considerations; second, there is the possibility of arguing that we count as evaluating only if we refer to hedonistic grounds. There is the same risk of lapse into truism.

4 Problems for hedonism

Hedonism may be aimed at supplying either a rationale for morality, or an alternative to it. Since most forms of hedonism judge the worth of courses of action by their consequences in terms of pleasure, they encounter the problems, as rationales of morality, of consequentialism (see Consequentialism): moral judgments of worth seem often partly or wholly independent of consequences, certainly of pleasure, however long-term (see Deontological ethics; Intuitionism in ethics). For egoistic forms of hedonism, there is the problem of explaining the apparently anti-egoistic bias of morality (see Egoism and altruism).

Whether considered as a rationale of morality or an alternative, hedonism has problems with the measurement of pleasure. It is not clear what to make of the question whether a given episode of skating gave as much pleasure as the supping of a glass of wine. They seem incommensurable. If these problems can be surmounted, there remain problems, for non-egoistic hedonists, of comparing different people’s pleasures.

Hegel, Georg Wilhelm Friedrich (1770-1831)

Hegel was the last of the main representatives of a philosophical movement known as German Idealism, which developed towards the end of the eighteenth century primarily as a reaction against the philosophy of Kant, and whose main proponents, aside from Hegel, include Fichte and Schelling. The movement played an important role in the philosophical life of Germany until the fourth decade of the nineteenth century. Like the other German Idealists, Hegel was convinced that the philosophy of Kant did not represent the final word in philosophical matters, because it was not possible to conceive a unified theory of reality by means of Kantian principles alone. For Hegel and his two idealistic predecessors, a unified theory of reality is one which can systematically explain all forms of reality, starting from a single principle or a single subject. For Hegel, these forms of reality included not only solar systems, physical bodies and the various guises assumed by organic life, for example, plants, animals and human beings, but also psychic phenomena, social and political forms of organization as well as artistic creations and cultural achievements such as religion and philosophy. Hegel believed that one of the essential tasks of philosophy was the systematic explanation of all these various forms starting from one single principle, in other words, in the establishment of a unified theory of reality. He believed this because only a theory of this nature could permit knowledge to take the place of faith. Hegel's goal here, namely the conquest of faith, places his philosophical programme, like that of the other German Idealists, within the wider context of the philosophy of the German Enlightenment.

For Hegel, the fundamental principle which explains all reality is reason. Reason, as Hegel understands it, is not some quality which is attributed to some human subject; it is, by contrast, the sum of all reality. In accordance with this belief, Hegel claims that reason and reality are strictly identical: only reason is real and only reality is reasonable. The considerations which moved Hegel to identify reason with reality are various. On the one hand, certain motives rooted in Hegel's theological convictions play a role. According to these convictions, one must be able to give a philosophical interpretation of the whole of reality which can simultaneously act as a justification of the basic assumptions of Christianity. On the other hand, epistemological convictions also have to be identified to support Hegel's claim that reason and reality are one and the same. Among these convictions belong the assumptions (1) that knowledge of reality is only possible if reality is reasonable, because it would not otherwise be accessible to cognition, and (2) that we can only know that which is real.

According to Hegel, although reason is regarded as the sum total of reality, it must not be interpreted along the lines of Spinoza's model of substance. Reason is rather to be thought of as a process which has as its goal the recognition of reason through itself. Since reason is the whole of reality, this goal will be achieved when reason recognizes itself as total reality. It is the task of philosophy to give a coherent account of this process which leads to self-knowledge of reason. Hegel conceived this process by analogy with the model of organic development which takes place on various levels. The basic presupposition governing the conception of this process is that reason has to be interpreted in accordance with the paradigm of a living organism. Hegel thought of a living organism as an entity which represents the successful realization of a plan in which all individual characteristics of this entity are contained. He called this plan the concept of an entity, and conceived its successful realization as a developmental process, in the course of which each of the individual characteristics acquires reality. In accordance with these assumptions, Hegel distinguished the concept of reason from the process of the realization of this concept. He undertook the exposition of the concept of reason in that section of his philosophical system which he calls the Wissenschaft der Logik (Science of Logic). In this first part of his system, the various elements of the concept of reason are discussed and placed into a systematic context. He presented the process of the realization of this concept in the other two parts of his system, the Philosophie der Natur (Philosophy of Nature) and the Philosophie des Geistes (Philosophy of Spirit). Apart from their systematic function, which consists in demonstrating reason in the Hegelian sense as total reality, both parts have a specifically material function in each case. In the Philosophy of Nature, Hegel aims to describe comprehensively all aspects of natural phenomena as a system of increasingly complex facts. This system begins with the simple concepts of space, time and matter and ends with the theory of the animal organism. The Philosophy of Spirit treats of various psychological, social and cultural forms of reality. It is characterized by the assumption of the existence of something like genuine, spiritual facts, which cannot be described as subjective states of individual persons possessing consciousness, but which have an independent, objective existence. For Hegel, examples of such facts are the state, art, religion and

history.

In spite of the relatively abstract metaphysical background of his philosophy, which is difficult to reconcile with common sense, Hegel's insights in his analysis of concrete facts have guaranteed him a permanent place in the history of philosophy. None the less, for contemporary readers these insights are interesting hypotheses, rather than commonly accepted truths. Of lesser importance among these insights should be counted Hegel's results in the realm of natural philosophy, which soon suffered considerable criticism from practising natural scientists. The important insights apply more specifically to the spheres of the theory of knowledge as well as the philosophy of right, and social and cultural philosophy. Hegel is thus regarded as an astute and original representative of the thesis that our conception of objectivity is largely determined by social factors which also play a significant role in constituting the subject of cognition and knowledge. His criticisms of the seventeenth- and eighteenth-century concepts of natural law and his thoughts on the genesis and significance of right in the modern world have had a demonstrable influence on the theory of right in juridical contexts. Hegel's analysis of the relationship and interplay between social and political institutions became a constituent element in very influential social theories, in particular that of Marx. The same applies to his central theses on the theory of art and the philosophy of religion and history. Hegel's thoughts on the history of philosophy made that topic a philosophical discipline in its own right. Thus Hegel was a very influential philosopher. That his philosophy has none the less remained deeply contentious is due in part to the fact that his uncompromising struggle against traditional habits of thought and his attempt to establish a conceptual perspective on reality in contrast with the philosophical tradition of the time remains characterized by a large measure of obscurity and vagueness. Unfortunately these characteristics also infect every summary of his philosophy.

1 Life and works

Hegel was born on 27 August 1770 in Stuttgart, son of a Württemberg official. In the autumn of 1788, after attending the local grammar school, he began a course of study at the Protestant Seminary in Tübingen in preparation for a career as a Protestant clergyman. Two of his fellow students and friends were F.W.J. Schelling and F. Hölderlin. In autumn 1793, after successfully completing this period of study, Hegel became a private tutor in Berne, Switzerland, and remained there until 1796. From January 1797 until the end of 1800 he was a private tutor in Frankfurt am Main, where he again came into contact with Hölderlin, who played an important role in the formation of Hegel's early philosophical convictions. Thanks to a legacy, Hegel was able to abandon his position as a tutor and pursue his academic ambitions. Early in 1801 he went to Jena. His student friend Schelling had become Fichte's successor and was lecturing in philosophy at the university there. With Schelling's energetic support Hegel qualified as a *Privatdozent* in the autumn of 1801 with a thesis on natural philosophy. Initially, Schelling and Hegel worked closely together, a fact which is documented by a philosophical periodical which they published jointly from 1802 (although it ceased publication following Schelling's departure from Jena in 1803). In 1805 Hegel was appointed Extraordinary Professor, but financial difficulties forced him to abandon his activities at the University of Jena in the autumn of 1806. A friend's intervention enabled him to take over as editor of a daily newspaper in Bamberg in March 1807. In November 1808 the same friend then ensured that Hegel was nominated rector and professor at a grammar school in Nuremberg. After a few years in this capacity, Hegel was able to return to university life. In 1816 he was called to the University of Heidelberg, which he left again in 1818 to take a chair at the University of Berlin, as Fichte's successor. There he revealed a considerable talent for academic teaching and succeeded in assuring a dominant position in contemporary discussions for his philosophical doctrines. Hegel died in Berlin during a cholera epidemic on 14 November 1831, at the height of his fame.

Hegel's works can be divided into three groups: (1) texts written by Hegel and published during his lifetime; (2) texts written by him, but not published during his lifetime; and (3) texts neither written by him nor published during his lifetime. Two texts from his early years in Frankfurt do not fit into this scheme. The first is the translation of a pamphlet by Cart, a Berne lawyer, on the political situation in the Canton of Vaud, which was translated and annotated by Hegel, and which he published anonymously in 1798. This is the first printed text by Hegel; the second is a fragment dating from the same period and known as the *Systemprogramm des deutschen Idealismus (System-Programme of German Idealism)*. The text has survived in Hegel's handwriting, but his authorship remains controversial.

The earliest writings in the first group date from the beginning of Hegel's time in Jena. His first philosophical

work is entitled *Differenz des Fichte'schen und Schelling'schen Systems der Philosophie* (*The Difference between Fichte's and Schelling's System of Philosophy*) (1801b). This was followed later during the same year by the essay which he had to submit in order to qualify as *Privatdozent*, *De Orbitis Planetarum (On the Orbits of the Planets)*. In 1802-3 Hegel published various philosophical works in the periodical which he edited with Schelling, the *Kritisches Journal der Philosophie (Critical Journal of Philosophy)*. The most important among these were *Glauben und Wissen (Faith and Knowledge)*, *Verhältnis des Skeptizismus zur Philosophie (The Relationship of Scepticism to Philosophy)* and *über die wissenschaftlichen Behandlungsarten des Naturrechts (On the Scientific Ways of Dealing with Natural Law)*. Immediately after his period as a university teacher in Jena and at the beginning of his period in Bamberg, Hegel published his first great philosophical work, the *Phänomenologie des Geistes* (*Phenomenology of Spirit*) (1807). During the eight years in which he taught at the grammar school in Nuremberg, Hegel published his three-volume *Wissenschaft der Logik* (*Science of Logic*) (1812, 1813, 1816). While in Heidelberg, the complete presentation of his system appeared for the first time, in his *Enzyklopädie der philosophischen Wissenschaften in Grundrisse* (*Encyclopedia of the Philosophical Sciences in Outline*) (1817), which was reprinted twice during his Berlin period in two completely revised editions (1827, 1830). Also during this period he published *Naturrecht und Staatswissenschaft im Grundrisse. Grundlinien der Philosophie des Rechts (Natural Law and Politics in Outline. The Principles of the Philosophy of Right)* (1821). Apart from these, Hegel published only minor writings during his lifetime. These were written partly in response to events at the time, although most articles were for the *Jahrbücher für wissenschaftliche Kritik (Yearbooks of Scientific Criticism)*, which he co-edited from 1827. Among these is his final published work, *Über die englische Reform-Bill (On the English Reform Bill)* (1831).

The second group of texts includes those works which were written by Hegel but not published by him. Almost all these texts first became accessible in a more or less authentic form during the twentieth century. They can again be divided into three groups. The first group consists of the manuscripts which Hegel wrote between the end of his time as a student and the end of his time in Jena. Among the most important are the so-called *Theologische Jugendschriften* (*Early Theological Writings*), which were published in 1907 at the instigation of Wilhelm Dilthey by his pupil, H. Nohl. Today they are known as Hegel's *Frühschriften (Early Writings)*. Further important texts from this period are the three *Jenaer Systementwürfe* (*Jena Drafts of a Philosophical System*), written between 1803 and 1806, partly for publication and partly as lecture notes. The second group of writings not published by Hegel consists of works produced during his period in Nuremberg. Hegel's first biographer, K. Rosenkranz, presented excerpts from these writings as the *Philosophische Propädeutik (Philosophical Propaedeutic)* (1840). In this text Hegel attempted to present his philosophical views in a form suitable for use within the framework of his grammar-school teaching courses. The third group of texts comprises manuscripts and notes which he wrote in connection with his lectures in Heidelberg and Berlin. They are partly contained in the editions in which his pupils and friends published his works after his death.

The third major group of texts covers those works which were neither written nor published by Hegel. They form almost half the texts contained in the first complete edition of Hegel's works. Among them one finds Hegel's extremely influential lectures on aesthetics, the philosophy of history, the history of philosophy and the philosophy of religion. In the form in which they have become influential, these texts are the product of students, in most cases representing the result of notes compiled during Hegel's lectures. Insufficient attention has been paid to this remarkable fact, that is, that some of Hegel's most influential texts actually have the status of secondhand sources.

The first complete edition of Hegel's work, published during the years 1832-45, proved to be influential but highly unreliable both from a historical and a critical point of view. Since the beginning of the twentieth century several attempts have been made to produce a new edition. To date, none has reached a successful conclusion. Since 1968 a new historical and critical edition of Hegel's complete works has been in preparation. By the end of 1996 fifteen volumes had been published.

2 The development of the system: the early writings

The early years of Hegel's intellectual career were characterized less by philosophical ambitions than by interests in public enlightenment and public education. In contrast to his student friends Hölderlin and Schelling, whose activities were directly based on internal philosophical discussions, Hegel aimed in his early works to find ways 'to influence men's lives' (as he wrote to Schelling). He regarded as an appropriate starting point for these

attempts the analysis of the role and consequences which must be attributed to religion, especially Christianity, for the individual and for the social context of a nation. In this early approach two different interests are at work. On the one hand, Hegel aims to show how religion had developed into a power hostile to life, which produces its effect through fear and demands submission. On the other hand, however, he would like to understand the conditions under which it can prosper as a productive element in the life of the individual and society. Hegel's investigations of religion under these two aspects were strongly influenced during the early years (1793-1800) by the cultural criticism and social theories of Rousseau as well as the religious philosophy of Kant (§§11, 13), and by his critical assessment of the theological positions of his academic theology teachers in Tübingen (G.C. Storr and J.F. Flatt). The most important works during this period are represented by the texts which have been preserved as fragments, and which have become known under the titles *Die Positivität der christlichen Religion (The Positivity of the Christian Religion)* (1795-6) and *Der Geist des Christentums und sein Schicksal (The Spirit of Christianity and its Fate)*, (1798-9).

Hegel's religious criticism centres on the concept of 'positive religion'. For Hegel, a positive religion is one whose fundamental content and principles cannot be made comprehensible to human reason. They thus appear unnatural and supernatural, and are seen to be based on authority and to demand obedience. For Hegel, the Jewish religion represents the paradigm of a positive religion. Hegel also considers that the Christian religion has been transformed into a positive religion during the course of its history, in other words into a religion which alienates human beings from themselves and from their fellow creatures (see Alienation §1). He tries to identify cultural and social developments as an explanation for this transformation. In direct opposition to positive religion, Hegel conceives what he calls 'natural religion', which he defines as one whose doctrines correspond with human nature: one which permits or even encourages people to live not only in harmony with their own needs, inclinations and well-considered convictions, but also without being alienated from other people. Hegel's belief in the value for mankind of harmony with oneself (and others), which is strongly influenced by the Stoic ethic (which also via Rousseau had an impact on Kant's practical philosophy), is grounded in a quasi-metaphysical conception of love and life. It owes a considerable debt to the philosophical approach of Hölderlin, with whom Hegel again associated closely during his Frankfurt period. According to this conception, there is a sort of moral emotion of love, which rises above all separations and conflicts, in which persons might be involved in relation to themselves and to others. It is this emotion of love which makes people aware of their unity with others and with themselves. It cannot be adequately thematized by philosophy, which is based on reflection and (conceptual) distinction. It demonstrates vividly, however - and here metaphysics enters - the true constitution of reality, which consists of a state of unity forming the basis for all separations and conflicts and making these possible. This reality, which has to be thought of as unity, Hegel calls 'Life' (*Leben*) and also 'Being' (*Sein*). Hegel's efforts at the end of his Frankfurt period are directed towards thinking of reality in these terms in a sufficiently differentiated manner. In doing so he pursues above all the goal of conceiving of life as a process which generates as well as reconciles oppositions, a dynamic unity of generation and reconciliation. To explain this complex structure, which he conceives what he calls 'life' to be, Hegel devised in the so-called *Systemfragment von 1800* the formula 'Life is the connection of connection and non-connection'. This formula and the concept of life on which it is based already point clearly towards Hegel's later organicist metaphysics.

3 The development of the system: the Jena writings

The work of Hegel's Jena period (1801-6) can be divided into critical and systematic writings. Among the critical writings are his first philosophical publication, *The Difference between Fichte's and Schelling's Systems of Philosophy*, and most of the essays which he published during the years 1802-3 in the *Critical Journal of Philosophy*. In these essays, Hegel reveals himself as a critic of the philosophy of his age, especially of the positions of Kant, Jacobi and Fichte whom he accuses of practising a 'reflective philosophy of subjectivity' as he calls it in the sub-title of his essay *Faith and Knowledge* (1802). For Hegel, reflective philosophy is initially an expression of an age or historical situation. Such an age is subject to the dichotomies of culture (*Bildung*), which are the products of the understanding and whose activities are regarded as divisive and isolatory. Being subject to those dichotomies, it is impossible for such an age to overcome them and restore the harmony which the understanding has destroyed. A philosophy committed to such an age shares its fate, being also unable to remove, at least in theory, the conflicts which appear as the concrete forms of dichotomy. For even when philosophy strives to overcome these conflicts - according to Hegel, 'the only interest of reason' - and thus makes reference to a

particular idea of unity or harmony, even then it remains committed to the conditions of its age and will achieve nothing except newer and even more acute conflicts. According to Hegel, we can characterize the general form underlying the various conflicts as the conflict between subjectivity and objectivity. The attempts of reflective philosophy to overcome them fail, in Hegel's view, because they are largely abstract: that is, they fail to take into account either the subjective or the objective component of the conflict, and declare it to be resolved by neglecting or abstracting from either of these components. In abstracting from subjectivity, objectivity (in Hegel's terminology) is posited as absolute, which leads to the subordination of subjectivity. This way of reconciling the conflict between subjectivity and objectivity is characteristic of all religions describable as positive by Hegel's definition. If, on the other hand, abstraction is made from objectivity, and subjectivity is thus posited as absolute, then objectivity is regarded as being dependent on subjectivity. This one-sided absolutization of subjectivity is Hegel's objection to the philosophies of Kant, Jacobi and Fichte and the reason he describes their theories as forms of a reflective philosophy of subjectivity.

During his early years in Jena, in contrast to the philosophical attitudes which he criticized, Hegel assumes along with Schelling that the described conflict between subjectivity and objectivity can only be overcome by a philosophy of identity. A philosophy of identity is characterized by the preconditions (1) that for each opposition there is a unity which must be regarded as a unity of the opposing factors, and (2) that the opposing factors are nothing more than their unity under the description or *in the form* of the opposing factors. These preconditions suggest that one should understand the overcoming of the opposition between subjectivity and objectivity as a single process which *reconstructs* the unity underlying the opposing factors and makes them possible in the first place. Following the conceptual assumptions favoured by Hegel at the time, the unity to be reconstructed in a philosophy of identity is defined as the 'subject-object', and the subject and object themselves are characterized as 'subjective subject-object' or 'objective subject-object' respectively. The process of reconstruction of the subject-object by means of the assumptions of the philosophy of identity consists of recognizing the subjective and objective subject-object in their specific one-sidedness or opposition to each other, and thus gaining an insight into the internal structure of the subject-object as the unity which underlies the two conflicting factors and makes them possible in the first place. Although Hegel did not persist in using this terminology for long, for most of his time in Jena he nevertheless remained faithful to the project of the development of a unity which he considered to be comprehensive and which consists of its internal opposing elements. The various attempts at a formal description of a process which was aimed at a unity led Hegel to various system models. All of them contained - albeit with variations of terminology and detail - a discipline initially defined by Hegel as 'logic and metaphysics' as well as a so-called 'real philosophy' (*Real-Philosophie*), in other words a 'philosophy of nature' as well as what he later called a 'philosophy of spirit'.

The systematic works of the Jena period, apart from the *Phenomenology of Spirit*, principally include the three *Jena Drafts of a Philosophical System*. Of these (in some cases) comprehensive fragments, mainly the sections dealing with the philosophy of nature and of spirit are extant. As regards the philosophy of nature, in all the Jena versions of this part of Hegel's system the description of all natural phenomena, the analysis of their processes and their interrelationships is achieved by recourse to two essential factors, which Hegel calls 'Ether' and 'Matter' (*Materie*). 'Ether' describes something like a materialized absolute, which expresses and develops itself within the realm of space and time. This entity is now introduced by Hegel in connection with the development of the determinations of nature as absolute matter or alternatively as absolute being, and the task of philosophy of nature lies in interpreting the various natural phenomena - from the solar system and the laws governing its movements to illness and death of animal organisms - as different manifestations of this absolute matter. Hegel is concerned not merely to show that any particular natural phenomenon is in its peculiar way a specific expression of absolute matter. Above all, he is concerned to prove that nature is a unity ordered in a particular manner. As a specific expression of absolute matter, each natural phenomenon represents an element in the ordered succession of natural phenomena. The position of a natural phenomenon in the order of nature is laid down by the specific way in which absolute matter is expressed in it. A consequence of this approach is that here the natural order is understood as determined by certain postulates which result from the structural conditions of the absolute matter and the methodological maxims of the complete description of these conditions. Differences between the Jena versions of Hegel's philosophy of nature mainly result from the inclusion of new facts made available by current science; but they leave his basic assumptions untouched.

Things are different in the case of the Jena writings on the second part of real philosophy - the philosophy of spirit - initially still described by Hegel as the ‘philosophy of ethical life’ (*Philosophie der Sittlichkeit*). They reveal many changes, all linked to modifications of his conception of spirit. Initially, he presents his philosophy of spirit as a theory of ethical life, which he then transforms into a theory of consciousness. For reasons linked to a renewed preoccupation with Fichte and certain new insights into the logical structure of self-consciousness, towards the end of his Jena period Hegel found himself obliged to present an approach which had occupied him since at least 1804-5. This approach enabled him to liberate the philosophy of spirit from its narrow systematic links to a conception of ethical life based on assumptions incompatible with his new conception of spirit. It assumes that only the formal structure of self-consciousness, which consists in its being a unity of generality and singularity, can provide the framework within which the logical-metaphysical determinations, the natural world and psychosocial phenomena unite to form a meaningful systematic context. For the philosophy of spirit this means in particular that as far as method is concerned it is better equipped for the implementation of its systematic task of being the representation of the processes of self-realization of what Hegel calls ‘reason’. This insight into the formal structure of self-consciousness is the final achievement of his Jena period, and one which he never subsequently abandoned.

4 The system: metaphysical foundations

Hegel’s systematic philosophy attempts to comprehend reality in all its manifestations as a self-representation of reason (*Vernunft*). His conception of what he calls ‘reason’ combines various specifically Hegelian connotations, both ontological and epistemological. For him, ‘reason’ is not merely the name for a human faculty which contributes in a specific manner to our gaining knowledge; he also uses ‘reason’ to describe that which is ultimately and eminently real. This is the ontological connotation. Reason is reality, and that alone is truly real which is reasonable. This programmatic credo, which has become famous from the foreword to Hegel’s *Philosophy of Right*, is the basic precept determining the entire approach to his system.

At least three different convictions make up this basic precept of the ontological dignity of reason. The first is that the totality of that which in one sense or another is real must be considered as the differentiation and partial realization of a primary structure which forms the basis for all facts which are real in that specific sense. Hegel calls this primary structure ‘the absolute’ or ‘reason’. He shares this conviction of the necessity of assuming a primary structure called ‘reason’ (interpreted ontologically) with Fichte, Schelling, Hölderlin and other members of the post-Kantian idealistic movement whose monistic approach is, indeed, defined by this assumption. For Hegel, therefore, this conviction does not require detailed philosophical justification. For him, it is justified because it alone offers a basis for systematic philosophical considerations, following the failure of all previous philosophical attempts to conceive of a unified and complete representation of the world.

This first conviction, which forms a part of Hegel’s ontological conception of reason, is still too imprecise to provide a clue as to why exactly the concept ‘reason’ can be used to characterize the primary structure. Hegel’s second important conviction, however, makes this clearer. It relates to the internal constitution of the structure which he characterizes as reason. He understands this structure to be a complex unity of thinking and being. The relevant motives for this conviction can be summarized as follows: the only philosophical approach which can organize the whole of reality into a unified and coherent picture accessible to knowledge is one which insists that everything taken to be real is only real inasmuch as it can be comprehended as the actualization of some specific structural elements of reason. This assertion of the essential reasonableness of all being, together with the first conviction of the necessity of assuming a primary structure, leads directly to the concept of this primary structure as a unity of thinking and being, understood in the very radical sense that thinking and being are one and the same, or that only thinking has being. If we now call this unity of thinking and being ‘reason’, and if, like Hegel, we are convinced that the requisite primary structure must be thought of as this unity of thinking and being, then reason will be declared on the one hand to represent what in the final analysis is ultimately real, and on the other that which alone is real. Since a monistic position is one in which a single entity is maintained as the ultimate and sole reality, Hegel’s philosophical conception has rightly been called a ‘Monism of Reason’ (see Monism).

The third conviction which enters into Hegel’s basic assumption of reason as the primary structure constituting reality and thus being ultimately and only real is that this structure constitutes reality and thus its own objectivity in a teleological process which must be understood as a process of knowledge. It is this conviction which leads to

the characteristically Hegelian dogma that there can be no adequate theory of reality without a dynamic or process-oriented ontology (see Processes). The formula which Hegel uses to characterize this process from his early Jena works onwards shows very clearly the dominant role which he assigns to what he defines as ‘reason’ in the systematic approach designed to elaborate his third conviction. This process is described as ‘self-knowledge of reason’ (*Selbsterkenntnis der Vernunft*). Hegel tries to integrate within this formula various aspects of his conception of reason. The first aspect is that it is necessary to take reason, understood as the primary structure, as something which is essentially dynamic. By this he means that the element of self-realization forms part of the moments which determine the primary structure. It is difficult to understand the way in which Hegel links this element of self-realization into his idea of reason as the unity of thinking and being. In order to get a rather over-simplified idea of the background for Hegel’s claim, it might help to rely metaphorically on the theory of organism: just as an organism can be described as an entity whose development is linked to the concept or the structural plan of itself in such a way that the (more or less) successful realization of this concept or structural plan belongs to its being real, so we should think of Hegelian reason, understood as the ontologically relevant primary structure, as realizing in a quasi-organic developmental process the unity of thinking and being which characterizes its concept, thereby representing itself as real or as reality.

The second aspect Hegel has in mind when he speaks of ‘self-knowledge of reason’, describing a process which must indeed be understood as that of the self-realization of reason, is that this process represents a process of *recognition* for reason. It is apparently not sufficient for Hegel to embed his idea of reason as the ontological primary structure in a conception of realization based on the paradigm of the organism. Such a grounding seems to be too unspecific for him, because it does not show how to describe a process which is typical of *all* organisms in such a way that we understand more precisely and in detail what it means for the process to be one of self-realization of *reason*. The specific way in which reason realizes itself is to be characterized first of all as a process of recognition, because only this characterization takes into account the fact that that which is being realized, namely reason, must be thought of strictly as nothing more than thinking *qua* recognition. But even this way of conceiving the realization of reason is still too imprecise, unless one includes in the concept of realization the thesis that reason is the ultimately and only real ontological primary structure. The inclusion of this thesis then leads directly to the teleologically conceived description of the process of the realization of reason as a process of self-recognition. For if only reason - by which is meant the unity of thinking and being - is real, and if an integral part of this concept of reason is the conception of its realization in the form of a process of recognition, then this process can only be directed towards the recognition of reason itself, because nothing else exists. Since this process aims to make reason aware that it alone is real, the presentation of this process, in Hegel’s view, must take on the form of a system in which each manifestation of reality documents its reasonable nature. His philosophy aims to elaborate this system.

The project of exhibiting reason not only as the basis for all reality, but also as the whole of reality itself, was Hegel’s sole, lifelong philosophical goal. It took him some time to be able to formulate this project explicitly. This is linked to his intellectual development (see §2 above). He also considered various approaches to the realization and development of this project (see §3 above), but he never felt any need to question the project itself.

5 The system: *Phenomenology of Spirit*

The *Phenomenology of Spirit* (1807) is Hegel’s most influential work. It serves as an introduction to his philosophical system by means of a history of the experience of consciousness. The *Phenomenology of Spirit* represents only one of a number of introductory attempts he made. In the Jena writings and system drafts, a discipline which Hegel calls ‘logic’ assumes this function. This logic is intended to fulfil its introductory function by raising our ‘normal’ thinking, which is characterized by its confinement to irreconcilable oppositions, to the level of ‘speculation’ - Hegel’s term for philosophical thinking. Speculative thought is characterized by the knowledge of the reconcilability of oppositions and of the mechanisms of their coming about. That thinking, which by its insistence on oppositions simultaneously maintains their basic irresolvability, Hegel referred to at this time as ‘reflection’. He regarded the elevation of this thinking to the position of speculation as a destruction of the structures which characterize reflection, and which together constitute the finiteness of reflection. ‘Finiteness’ of reflection or (used by Hegel as a synonym) of the understanding (*Verstand*) is initially a way of saying that thinking whose oppositions are irreconcilable moves within limits and must thus be regarded as finite. According to Hegel, it is now the task of logic to carry out the destruction of the finiteness of reflection or of the thinking of

the understanding, thereby simultaneously leading to the standpoint of speculation or of the thinking of reason. Hegel sees the problem of a logic, which he understands as an introduction to philosophy, to be to carry out this destruction in such a way that not only the limitations of the thinking of the understanding and its preconditions are presented as mistakes and absurdities, but also that during this destructive process those structures become clear which guarantee a reasonable (that is, an intrinsic speculative) insight into the basic structures of reality.

Towards the end of his Jena period, Hegel abandoned the project of developing a system of logic as an introduction to philosophy, and in its place presented a new discipline which he called the 'Science of the Experience of Consciousness' or 'Phenomenology of Spirit'. The declared goal of this discipline is twofold: on the one hand, it should destroy our supposedly natural picture of the world, and thus also our understanding of ourselves as the more or less consistent holders or subjects of this view, by demonstrating the contradictions which arise in our normal, complex view of the world. And second, it should thereby demonstrate that our view of the world as something which is both alien and different from us is not tenable, but that we and the world represent a structural unity with the essential characteristic of self-knowledge and thus being conscious of itself.

Hegel pursues this dual goal in a complex and ambitious thought-process, which attempts to combine and position within a comprehensive context a wide range of themes - historical, epistemological, psychological, meta-scientifical, ideological-critical, ethical, aesthetical and religio-philosophical. This whole thought-process is based on two convictions which govern Hegel's entire construction: (1) It is possible to conceive of all epistemic attitudes of a consciousness towards a material world as relations between a subject termed 'cognition' (*Wissen*) and an object termed 'truth' (*Wahrheit*). That which is presented as cognition or truth is in each case determined by the description which the consciousness is able to furnish of its epistemic situation and its object corresponding to this situation. (2) 'Knowledge' (*Erkenntnis*) can only be taken to be that epistemic relation between cognition (subject) and truth (object) in which cognition and truth correspond with each other, which for Hegel is only the case if they are identical. A necessary, though not sufficient, condition for claiming this relationship of identity between cognition and truth is that what is regarded as cognition or as truth respectively is not formulated in a self-contradictory or inconsistent manner. For the Hegel of the *Phenomenology of Spirit*, and of the writings which were to follow, knowledge in the strict sense is thus really self-knowledge.

In characterizing the various epistemic attitudes of a consciousness to the world in the *Phenomenology of Spirit*, Hegel takes as his starting point something which he calls 'sense certainty'. He uses this term to describe an attitude which assumes that in order to know the true nature of reality we must rely on that which is sensually immediately present to us as a spatiotemporally given single object. Hegel demonstrates the untenability of this attitude by attempting to prove that in such an immediate reference to objects nothing true can be claimed of them. Moreover this immediate approach shows that any attempt to gain knowledge of what an object really is implies at the outset a different attitude towards objects. This attitude is determined by the assumption that what we are really dealing with if we refer to objects in order to know them is not the immediately given object, but the object of perception, which is characterized by Hegel as an entity defined through its qualities. According to Hegel, however, even this attitude is not tenable. Neither the perceiving consciousness nor the object perceived nor the relationship which is believed to exist between the two can be accepted in the manner in which they appear in this constellation: the subject, which aims to perceive the object of perception as that which it really is, can neither formulate a consistent concept of this object nor describe itself in unequivocal terms. The consciousness is thus led to a concept of an object which differentiates between what the object is in itself and what it appears to be. In order to differentiate in this manner, the consciousness must define itself as understanding, to which the inner constitution of the object in itself is disclosed as being constituted by its own laws, that is, by the laws of the understanding. Although, according to Hegel, this interpretation of the objective world through the cognizing subject also produces neither a truthful concept of the cognizing consciousness nor of the object in question, it none the less leads to the enforcement of an attitude according to which consciousness, when referring to an object, is referring to something which it is itself. The realization of this insight - that consciousness, when referring to objects, in reality relates to itself - converts consciousness into self-consciousness.

The various ways in which consciousness deals with itself and the objective manifestations corresponding with these ways as reason and spirit are comprehensively discussed by Hegel in the remainder of his *Phenomenology of Spirit*. It is in this context that he presents some of his most famous analyses, such as the account of the master-servant relationship, his critique of the Enlightenment and the French Revolution, his diagnosis of the

strengths and weaknesses of the ancients' ideas of morality and ethical life and his theory of religion. The conclusion of the *Phenomenology of Spirit* forms what Hegel calls 'absolute knowledge'. Hegel characterizes this knowledge also as 'comprehending knowledge' (*begreifendes Wissen*), aiming thereby to highlight two ideas: (1) that this knowledge is only present when the subject of the knowledge knows itself to be identical *under every description* with the object of that knowledge. Comprehending knowledge therefore only occurs when the self knows itself to be 'in its otherness with itself', as Hegel puts it at the end of the *Phenomenology of Spirit*. He also aims to point out (2) that this type of identity of a subject with an object is that which constitutes the essence of that which he calls the 'Concept' (*Begriff*) of reason. The task of the *Science of Logic* is to develop this 'Concept' of reason in all its logical qualities. The goal of the *Phenomenology of Spirit*, the discipline which is to provide an introduction to logic, is achieved when it becomes evident to the consciousness that (Hegelian) truth only belongs to the (Hegelian) Concept.

But the *Phenomenology of Spirit* is not just an introduction to the system. From another point of view, Hegel describes the phenomenological process as 'self-fulfilling scepticism'. By means of this metaphor he attempts to establish a link to a subject closely connected with his critical assessment of his cultural and political environment, namely that of dichotomy (*Entzweiung*). For Hegel, the modern age is characterized by the fact that unity has disappeared from people's lives. The all-embracing unity of life can no longer be experienced, as people are no longer in a position to integrate the various aspects of their understanding of the world in a conflict-free context. So, for example, their moral convictions will force upon them a view of the world in which something like freedom and consequently something like the belief in the possibility to cause events based on free decisions occupies an irrefutable position. This view, based on moral convictions, stands in a conflicting and, finally, aporetic relationship to their scientific view of the world, which commits them to an understanding of the world in which there are no first causes or unconditioned facts, because each cause must itself be interpreted anew as an effect, whose cause can only be seen as determined by previous circumstances. In this view of the world there is apparently no place for freedom. The conflict between various aspects of the understanding of the world, cited here by way of example, is for Hegel by no means singular; instead, it runs like a leitmotif through the modern conceptualizations of all spheres of life. He initially interprets it wholly in the spirit of Rousseau as a product of culture and civilization. This conflict is what separates a human being from itself, so that it continues to be denied a coherent image of the world. As a creature living in dichotomies, the modern person is an example of what Hegel calls the 'unhappy consciousness'.

Modern consciousness now attempts to solve this conflict by making each in turn of the conflicting views into the dominant attitude of its entire interpretation of the world. In this way, however, it can only achieve a one-sided interpretation of reality, which is just as incapable of doing justice to the true nature of reality as to the need of human consciousness to integrate all aspects of reality into its understanding of the world as a coherent unity. According to Hegel, it is in this situation that the need for philosophy arises. It is philosophy's task to destroy these one-sided total interpretations of consciousness and in this destruction to lay the foundation for the true complete interpretation of reality. The *Phenomenology of Spirit* describes this process of destruction and foundation-laying. The consciousness experiences it as a process of permanent destabilization of all the convictions on which it has always based its one-sided interpretations of the world. In this sceptical approach it is forced to doubt everything and to abandon all its supposed certainties. While the phenomenological process thus concedes a philosophical value to scepticism, in Hegel's understanding it simultaneously overcomes this scepticism by claiming a truth-revealing function for it. It is also Hegel's intention that the *Phenomenology of Spirit* should in this respect be understood as a treatise on the cathartic effect of philosophical scepticism.

Two questions have often been raised in connection with Hegel's conception of the *Phenomenology of Spirit* as an introduction to his 'System of Science', especially his logic. The first is whether Hegel does not assume in advance certain central theses of the discipline to which the *Phenomenology of Spirit* is intended to provide an introduction. This question draws attention to a methodological problem which originates from Hegel's assertion that the process of consciousness described in the *Phenomenology of Spirit* is not guided by any preconditions external to this process. This assertion seems difficult to square with certain manoeuvres which Hegel makes during the course of the *Phenomenology of Spirit*. The second question is of a more intrinsic nature and concerns the categorical apparatus employed by Hegel in the *Phenomenology of Spirit*. In this context, in particular his phenomenological conception of negation and identity as well as his concept of knowledge aroused critical interest

from the very beginning.

It is difficult to determine exactly how Hegel himself later assessed the success of the *Phenomenology of Spirit* as an introduction to the point of view which is assumed at the beginning of his *Science of Logic*. On the one hand, he seems to have allotted it a certain value throughout his entire life, not only as a history of consciousness but also as an introduction. This is shown not only by the fact that he made arrangements for the publication of a second edition of the work immediately before his death, but also by later statements in the various editions of the *Science of Logic* and the *Encyclopedia of the Philosophical Sciences*. However, it is in precisely these statements that one finds Hegel expressing an increasingly critical attitude towards his project of a phenomenological introduction to the system. In this context it should also be recorded that by 1827 at the latest (that is, from the second edition of the *Encyclopedia of the Philosophical Sciences*) Hegel no longer has recourse to a version of phenomenology as ‘a more detailed introduction, in order to explain and lead to the meaning and the point of view which is here allotted to logic’, but for this purpose uses instead a discussion which deals with three different ‘attitudes of thought to objectivity’.

6 The system: *Science of Logic*

The real centre of the Hegelian system is the discipline he described as ‘Logic’. It contains his doctrine of the categories, to use traditional terminology (see Categories §1). Hegel dedicated his most comprehensive and complex work to this discipline, the *Science of Logic* (1812-16), later adding a much shorter version within the framework of the *Encyclopedia of the Philosophical Sciences*.

The starting point of the *Logic* is the insight, justified in Hegel’s view by the result of the *Phenomenology of Spirit* (1) that all true knowledge is knowledge of oneself, and (2) that the subject of this knowledge, that is to say, that which knows about itself, is reason. Because Hegel - following Schelling - only considers that to be real which can also be known, he concludes from the results of the *Phenomenology of Spirit* that only reason is real. He thinks of this reason as, internally, an extremely complex entity. Hegel now distinguishes between the ‘Concept’ of reason and the process of its realization. The object of the *Science of Logic* is the conceptual, that is to say, for Hegel, the logical development of this Concept. Since this Concept is the Concept of that which alone is real, Hegel can maintain that his *Science of Logic* takes the place of traditional metaphysics, which concerned itself with the elucidation of the basic ways in which we can think of reality.

Since the object whose Concept is to be logically discussed is reason, understood to be the sum of reality, the Concept of reason must include not only those aspects which account for reason’s character of reality or of being, but also those aspects which do justice to the peculiar character of reason as thinking. Hegel calls these aspects ‘Determinations of the Concept’ (*Begriffsbestimmungen*). Those aspects of the Concept of reason which take into account its character of being are developed by Hegel in the section ‘Objective Logic’ in the *Science of Logic*. He presents those aspects which are intended to do justice to its thinking character in the section called ‘Subjective Logic’. He further subdivides ‘Objective Logic’ into ‘Logic of Being’ and ‘Logic of Essence’.

In his ‘Objective Logic’, Hegel tries to show how it is possible to generate from very simple, so-called ‘immediate’ determinations such as ‘Being’, ‘Nothing’ and ‘Becoming’ other categories of quality and quantity as well as relational and modal determinations, such as ‘Cause-Effect’, ‘Substance-Accidence’ and ‘Existence’, ‘Necessity’ and the like. As in the ‘Subjective Logic’, the basic strategy here for the creation of categories or determinations of the Concept, assumes that (1) for every category there is an opposing one which upon closer analysis reveals itself to be its true meaning, and that (2) for every two categories opposing each other in this manner there is a third category whose meaning is determined by that which makes the opposing categories compatible. Hegel considers these two assumptions justified because only they can lead to what in his eyes is a complete and non-contingent system of categories. Hegel himself, however, did very little to make their exact meaning clear, although he uses them with great skill. Immediately after his death this led to a confused and still inconclusive discussion regarding their interpretation. Many judgments concerning the worth or worthlessness of Hegel’s philosophy are linked to this discussion, which has taken its place in the annals of Hegel research as a discussion concerning the meaning, significance and value of the so-called ‘dialectical method’. (Hegel himself preferred ‘speculative method’.)

In particular, Hegel’s claims about the truth-generating function of contradiction have played a major role in the

discussion of the ‘dialectical method’ described in the *Science of Logic*. Though highly praised by Hegel himself, his doctrine of the nature and methodological merits of contradiction has proved to be inaccessible and obscure. This may have been caused in part by Hegel’s extremely concise and provocative formulations of this methodical maxim. The reader is reminded in this context not only of the succinct formulation which he chose to defend on the occasion of his Jena Habilitation - ‘contradiction is the rule of truth, non-contradiction the rule of falsehood’ - but also of his provocative version of the principle of contradiction, according to which ‘everything is inherently contradictory’. The difficulties associated with the comprehension of the Hegelian conception of contradiction have perforce a link with his particular unconventional concept of contradiction. Two points are particularly important, in that they differentiate his concept from the classical concept of contradiction of traditional logic: (1) A contradiction between two propositions cannot be confirmed solely on the basis of their ascription to a single subject of two contradictory predicates; it is also necessary to take into account the meaning of the subject of these propositions. If the contradictory predicates cannot meaningfully be attributed to the subject, then no contradiction arises. ‘Legible’ and ‘illegible’ are predicates which will only lead to contradiction if attributed to texts, but not, for example, to bananas. For Hegel, this means among other things that the relation of contradiction is dependent on the context. (2) Hegel thinks of contradictions as analogous to positive and negative determinations, which neutralize each other but without making that whose neutralizing determinations they are into a contradictory concept which has absolutely no meaning, which therefore means nothing (the Kantian ‘Nihil negativum’). Rather, the way in which positive and negative determinations neutralize each other tells us something informative about the object to which the neutralizing determinations apply. For example, possession of DM100 neutralizes a debt of DM100, without thereby making the concept of property a contradictory concept. Instead, the way in which this neutralization takes place makes clear that the concept ‘property’ means something which must be thought of as of a quantifiable size. For Hegel this is a consequence of ‘the logical principle that what is self-contradictory does not dissolve itself into a nullity, into abstract nothingness, but essentially only into the negation of its *particular* content’. Whether these two convictions are sufficient to justify Hegel’s thesis that contradictions play a ‘positive’ role in cognition procedures is rightly controversial.

Hegel’s ‘Subjective Logic’, the second part of the *Science of Logic*, contains not only his so-called ‘speculative’ interpretation of the objects of traditional logic, that is, his own doctrine of concepts, judgments and syllogisms, but above all his theory of the ‘Concept’. This theory is deeply rooted in Hegel’s critique of traditional metaphysics, and is thus most easily comprehended when placed in that context. He presents this critique most tellingly in the third edition of the *Encyclopedia of the Philosophical Sciences*. What matters in philosophy, and what philosophy aims at, is the ‘scientific recognition of truth’. This means among other things that philosophy is concerned with the recognition of ‘what objects really are’. According to Hegel, the question of what objects really are has been approached in philosophy from a variety of angles, but all the different modes in which the question has been answered to date are unacceptable because they are based on false premises. Traditional metaphysics is one of the ways of approaching the question of what objects really are. Hegel characterizes this approach as ‘the *impartial* method’, which is motivated by the assumption that ‘through *thinking the truth becomes known*, what objects really are is brought to one’s consciousness’. In contrast to other philosophical approaches that deal with the question posed, metaphysics, according to Hegel, is in principle certainly capable of contributing to the cognition of what things in truth are, because it starts from the correct assumption that ‘the determinations of thought’ are to be seen as ‘the fundamental determinations of things’. But traditional metaphysics has not made a significant contribution to the cognition of truth, because it was only able to transform its correct initial assumption in a systematically erroneous manner.

According to Hegel, the crucial weakness of traditional metaphysics is to use the form of judgment *in an unreflective manner*, and this shows itself in various ways. First it shows in the unfounded assumption of traditional metaphysics that judgments provide a particular and direct insight into the constitution of reality or that which really exists. In Hegel’s view this unfounded assumption has two consequences: the first is that it tends without reason to favour a particular ontological model of reality because it regards the subject-predicate form as the standard form of the judgment; the second consequence, in Hegel’s view incomparably more problematic, consists of the unfounded tendency of traditional metaphysics to conclude from the unquestioned and assumed correspondence between the form of judgment and constitution of reality that one can express by means of judgments what objects really are. Hegel does not find problematic the assumption contained in this conviction that one can make judgments concerning objects. He believes that the problem lies rather in the fact that one can

assume *without examination* that 'the form of the judgment could be the form of truth'. In Hegel's view, however, such an examination is essential because the traditional understanding of subject and predicate does not justify the assertion that a subject-predicate judgment actually contributes something to the determination of a real object. An additional problem lies in the fact that the unconsidered use of the form of judgment has led traditional metaphysics erroneously to use a 'natural' interpretation of the concepts of subject and predicate. The consequence of this interpretation is that judgments of the subject-predicate form can lay no claim to 'truth'.

Hegel's chief criticism of traditional metaphysics therefore lies in the lack of clarity associated with its interpretation of the form of the judgment. In particular he rejects its tendency to interpret the judgment 'naturally', which for him means to encourage a subjectivist interpretation of the judgment built on the concept of representation. Such a subjectivist interpretation cannot show how to guarantee for the judgment some sort of claim to truth or recognition of what something really is. Therefore the subjectivist metaphysical interpretation of the judgment is problematic at the very outset. Moreover, it becomes downright dangerous when one considers its ontological implications, for it leads erroneously to the assumption that the objects corresponding to the subjects of the judgment are to be thought of as substances to which are attributed the characteristics described by the predicate-concepts. The unreflective subjectivist interpretation implies or at least suggests what may be called a substance-ontology, according to which substances which are independent of each other are taken as the fundamental entities of reality, determined predicatively by accidental characteristics which are applicable or not applicable to them. It is this commitment to a substance-ontology which Hegel critically imputes to traditional metaphysics. From this criticism, he deduces that it is first necessary to reach an agreement as to what the object really is before one can adequately assess the function and the achievement of the judgment in the context of knowledge. To reach this agreement is the task of the Logic of the Concept.

The starting point of Hegel's theory of the Concept is the assumption which he imputes to traditional metaphysics as an insight which is in principle correct. This was the insight that only through thinking can one recognize what something really is. Since in Hegel's view thinking is concerned not with intuitions or representations, but with concepts, he identifies that which something in truth or really is with its Concept. Because of this identification, talk of the Concept acquires an ontological connotation. Hegelian Concepts must not be confused with the so-called general concepts of traditional logic. They are difficult to understand precisely and are characterized by the fact that they are (1) non-sensible - which means that they are a particular type of thought-object - and that they are (2) something objective as opposed to subjective. Regarded as these objective thoughts, these Concepts are determined in the sense that in them different relations of determinations of the Concept are to be encountered which occur as determinations of thinking or of thought (*Denkbestimmungen*). These determinations of thought can themselves be regarded as a kind of predicative characteristic. They make up the multitude of all those determinations on the basis of which the Concept of an object can be seen as completely fixed.

Now, in Hegel's view, not everything has a Concept which in one sense or another is ordinarily thought of as an object. A (Hegelian) Concept is only allotted to objects which can be thought of on the model of an organism. Hegel thus maintains that one can only regard those objects as real or as existing in truth for which there is a Concept which can be interpreted on the organic model. If, then, the 'scientific recognition of truth' consists in recognizing the Concept of something, and if a Concept is always a Concept of a organic-type object, then the question arises how one should conceive of such a Concept. For Hegel it is clear that in his concept of a Concept, he must include everything needed to describe an organism. This includes first of all what Hegel calls the subjective Concept, which one can best regard as the sum of all characteristics whose realization represents an organic-type object. For Hegel, in the case of the concept of reason, whose Concept the *Science of Logic* elaborates, these characteristics are exclusively logical data which can be presented in the form of determinations of concepts, judgments and syllogisms. Furthermore, Hegel's Concept must include the element of objectivity. 'Objectivity' here means more or less the same as reality or the state of being an object and suggests the fact that it is part of the Concept of an organism to realize itself. Since, however, Hegel holds that there is ultimately only one object which really exists, namely reason, the Concept of this object must include a characteristic which is exclusively applicable to itself. This characteristic must permit the justification of the claim that in reality there is only one Concept and therefore also only one object. Hegel calls this characteristic 'subjectivity'.

Although it is easy to see that the term 'subjectivity' describes a central element of Hegel's logical theory, it is very difficult to shed light upon its meaning and function therein. It is relatively obvious only that Hegel attributes

the characteristic of subjectivity not just to his Concept, but also to entities such as 'I', 'self-consciousness' and 'spirit'. We are therefore on safe ground if we assume that the subjectivity which is to be attributed to the Concept is precisely that which is also attributed to the I, self-consciousness or spirit and which distinguishes them from other types of organism. The ground becomes more dangerous when it is a matter of stating what subjectivity actually means. This is not merely because Hegel distinguishes between different types of subjectivity, but also because the subjectivity which is constitutive of the Concept is tied to conditions which are difficult to state with any precision. In general it seems to be correct to say that subjectivity occurs when something recognizes itself as being identical with something else. If we follow the *Science of Logic*, then this relationship of identity known as 'subjectivity' can only be established between entities which themselves can be thought of as being particular complexes of relations of similar elements or moments. Subjectivity in this sense is thus intended to describe a certain form of self-reference or self-relationship. According to Hegel, there should be only one entity to which the term 'subjectivity' can be attributed as a characteristic in the sense which has just been explained - the Hegelian 'Idea'. He says of it, 'The unity of the Idea is subjectivity'. This Idea now forms the end of the *Science of Logic*, because through it the Concept of reason has been completely explicated. He also describes this Idea as the absolute method, for it is not only the result, that is, the Concept which comprehends all his moments, but also the complete and systematically generated series of these moments.

The results of the Logic of the Concept represent the justification for Hegel's belief that, apart from a system of logic, a complete system of philosophy must include a so-called 'real philosophy', which is divided into a philosophy of nature and a philosophy of spirit. Hegel undertakes this justification within the framework of the exposition of what characterizes the fully developed (Hegelian) Concept. This exposition only becomes comprehensible if one remembers that Hegel is a supporter of the organological paradigm in metaphysics, according to which that which really is must be regarded as a particular type of organism. Hegel describes the type of organism relevant to his metaphysics as an object which has realized or objectivized its Concept in such a way that it comprehends itself as the objectivization of this Concept of itself. On the basis of this conception, Hegel now develops the following consideration: the (Hegelian) Concept is something which is to be regarded as a unity of (in some ways incompatible) determinations of the Concept. Among these determinations also belong, as Hegel believes he can show, that of objectivity. By this he means that it is a part of the nature of a Concept to become objective, to manifest itself as an object. Now, the only object which is an adequate realization of the Concept is the one to which what Hegel calls 'subjectivity' can be attributed. 'Subjectivity' is the name of a relational characteristic which is present when something *knows* itself to be identical with something else. For Hegel, it follows from these stipulations that subjectivity can only be attributed to the object which knows itself to be identical with its Concept. To produce this knowledge is therefore a demand inherent in the nature of the Concept. Since it is the sole task of the *Science of Logic* to exhibit the Concept of reason, and since this Concept contains the demand for the production of a form of knowledge which can only be acquired when (1) the Concept objectivizes itself, that is, becomes an object, and (2) this object comprehends itself as being identical with its Concept, then it is already a demand inherent in the Concept of reason that reason should be discussed (1) from under the point of view of its objectivity or as an object, and (2) under the aspect of its known identity with its Concept. The first of these topics is the subject of a philosophy of nature; the second that of a philosophy of spirit.

7 The system: philosophy of nature

Hegel's philosophy of nature is an attempt to explain how it is possible that we can recognize nature as a complex whole standing under a set of laws. He thereby takes up the question, important in particular to both Kant and Schelling, of which epistemological and ontological preconditions underlie our conviction that nature can be known. Although Hegel had thought about the problems of a philosophy of nature since his time in Frankfurt, and although he produced several versions of a philosophy of nature during his Jena period, he only published this part of his system once, quite late, in his *Encyclopedia of the Philosophical Sciences*. Hegel's philosophy of nature is of interest mainly in three respects. The first concerns the way in which he transforms his logical theory into an interpretation of natural phenomena. The second relates to the question of how far Hegel's conceptions in the field of the philosophy of nature take into account the scientific theories current at the time. Finally, the third leads to the question of what we should make of Hegel's approach to a philosophy of nature within the framework of present-day philosophy of science. Since the philosophy of nature is that part of the Hegelian system which is

traditionally regarded with the greatest suspicion and which for this reason has received the least scholarly attention, the assessment of the second and third aspects of this philosophy of nature has so far produced very few uncontroversial results.

As far as the construction of a philosophy of nature according to the requirements of the logical theory of the Concept is concerned, Hegel assumes in accordance with his organological conception of reason that we should think of nature '*in itself* as a living whole'. This living whole has to be conceived of primarily under three different determinations, which reproduce to a certain extent the central characteristics of the Concept of reason as developed by the logical process. According to the first of these determinations, nature is to be considered as a whole defined by space, time, matter and movement. This way of looking at nature makes it the object of what Hegel calls 'mechanics'. According to Hegelian mechanics, space, time, matter and movement, their characteristics and the laws of nature which describe their relationship are generated by the formal structural moments of the (Hegelian) Concept. The utilization of such a 'conceptual' procedure to gain and secure scientific results was never seen by Hegel himself as a direct alternative procedure to empirical scientific research. On the contrary, he was of the opinion that (for instance, by means of his philosophical mechanics) he only makes explicit the conceptual elements and secures for them a rational foundation which is implicitly contained in every scientific mechanical theory that acquires its data 'from experience and then applies the mathematical treatment'.

According to Hegel, his philosophical mechanics leads to the insight that we must think of the whole of physical nature as 'qualified matter', that is, as a totality of bodies with physical characteristics. This provides the second main determination by which nature is to be comprehended. Hegel ascribes to this way of comprehending nature a discipline which he calls 'physics', including under this heading everything which can in any way be linked with the material status of a body. Accordingly, from phenomena like specific weight, through those like sound, warmth, shape, electricity and magnetism, to the chemical reactions of substances, everything is described as being a consequence of and following from the constitution of the (Hegelian) Concept. He also adds theses concerning the nature of light and a doctrine concerning the elements earth, fire, water and air. It was this part of Hegel's philosophy of nature in particular which drove Hans Scholz, among others, to the following crushing judgment: 'Hegel's philosophy of nature is an experiment which set the philosophy of nature back several centuries instead of furthering its cause, returning it to the stage it had reached at about the time of Paracelsus'. Whether this dictum has substance, however, depends very much on what conception of nature and science one favours.

The third part of Hegel's philosophy of nature consists of the so-called 'organic physics' or 'organics'. In this section the characteristic of subjectivity, familiar from his logical theory, is the determination under which nature is to be regarded. Since in the context of the philosophy of nature, Hegel interprets subjectivity as an essential characteristic of organic life, this section of his philosophy of nature is concerned with nature as a hierarchy of organisms or as an 'organic system'. He distinguishes between three forms of organic life which are exemplified in three types of organism: the general form, which is represented by the geological organism, the particular, which is realized in vegetation, and the individual, which finds its expression in animal organisms. He regards these forms as hierarchically ordered by increasing degree of complexity. In some ways Hegel thematizes relations and conditions of dependence: just as vegetable life-forms presuppose geological structures and processes, so animal organisms presuppose a fully developed plant world. Hegel links this last part of his philosophy of nature to his philosophy of spirit by means of an analysis of the phenomenon of the death of an individual natural being. Here the leading idea is that although through death all natural determinations of the individual are removed, so that we can speak of the 'death of the natural element', none the less death does not annihilate the principle of life, that which is responsible for the essential unity of animal organization and which Hegel calls the 'soul'. Since Hegel interprets the soul as a form of spirit, and since according to his conception the soul is not destroyed by death, he can now postulate the reality of spirit independently of natural determinations as the result of his philosophy of nature, and investigate this reality in its various forms within the framework of a philosophy of spirit.

The question whether Hegel's philosophy of nature integrates in a relatively informed manner the state of science during his lifetime has provoked a number of fairly controversial answers, as has the question whether his approach can still provide any promising perspectives which are relevant today. During the nineteenth century, Hegel's philosophy of nature was broadly considered scandalous by the majority of scientists, an attitude which contributed in no small measure to the discrediting of his philosophy as a whole. This assessment also meant that Hegel's philosophy of nature has never really been taken seriously again. Since 1970, however, the situation has

changed somewhat. Starting from and relying on recent investigations in the history of science regarding the development and state of the sciences during the early nineteenth century, increasing numbers of scholars are inclining towards the view that Hegel was indeed much more familiar with the science of his time and its problems than was generally believed during the nineteenth and most of the twentieth century. It seems advisable at present to refrain from passing final judgment on this matter. The same cannot, however, be said with regard to the present relevance. Here one cannot ignore the fact that Hegel's theses concerning philosophy of nature are, quite simply, meaningless for present-day scientific theory.

8 The system: philosophy of spirit

Hegel's philosophy of spirit is divided into a theory of subjective, objective and absolute spirit. The philosophy of subjective spirit contains Hegel's philosophical psychology; his philosophy of objective spirit is devoted to his theory of law and politics and his conception of world history; and his philosophy of absolute spirit presents his theory of art, religion and philosophy. Hegel presented his philosophy of subjective spirit and in particular his philosophy of absolute spirit to a wider public only in outline in a few paragraphs of the *Encyclopedia of the Philosophical Sciences*. He presented his philosophy of objective spirit not only in the *Encyclopedia*, but also in detail in a work which was already highly regarded during his lifetime, *Natural Law and Politics in Outline: The Principles of the Philosophy of Right* (1821). In this part of his system Hegel again relies on the principle developed in his logical theory that something - here the entity called 'spirit' - must experience a process of realization in order to be able to recognize its truth, or what it is.

The philosophy of subjective spirit contains an anthropology, a phenomenology of spirit and a psychology. In these sections Hegel describes and analyses all the phenomena that influence the somatic, psychophysical and mental characteristics, conditions, processes and activities of the individual. The gamut of subjects he covers runs from the natural qualities of the individual, expressed in temperament, character and physiognomy, via sensibility, feeling, awareness and desire, to self-awareness, intuition, representation, thinking and wanting. Here one finds Hegel's theory of language acquisition, of practical feeling, of the achievements and function of imagination, his defence of the life-preserving power of habit, his solution of the mind-body problem, his understanding of the origin and treatment of mental illnesses and many other subjects. In these analyses Hegel's aim is to replace the 'ordinary approach' of empirical psychology with a 'philosophical perspective' towards psychological phenomena. The dominant characteristic of this philosophical attitude, it is claimed, is that it permits an interpretation of the subject of psychic processes as the product of psychic activity and not as an object to be thought of as a substance possessing certain powers and capacities which are its characteristics.

While the philosophy of subjective spirit really only attracted attention up to the middle of the nineteenth century, Hegel's philosophy of objective spirit, in other words his theory of law and politics, received a great deal of attention during the nineteenth and especially the twentieth century. This was not only because of the theory's great importance for the Marxist and other anti-liberalistic social theories (see Marx, K.; Western Marxism). It has also repeatedly been the object of violent controversy, especially because of its political implications. In all its versions, Hegel's political philosophy rests on three main convictions which he cherished from his early years and held for the rest of his life. The first is that every modern philosophy of law and politics must incorporate the conception of freedom which was central to the European Enlightenment, and in particular to that of Germany (see Enlightenment, Continental). The second is that, especially in the case of modern political philosophy, the insight that the whole takes priority over its separate parts, an insight formulated by Aristotle in his *Politics*, must be maintained and brought up to date. Finally, the third conviction consists in an application of the principle which shapes Hegel's whole philosophical enterprise, namely, that political philosophy must play its part in the confirmation of the thesis that only reason is real. Hegel attempts to do justice to these three convictions within the framework of his theory of objective spirit by (1) introducing an extravagant conception of freedom, (2) identifying the whole of Aristotle with the phenomenon which he calls 'ethical life' and (3) declaring this phenomenon called 'ethical life' to be the 'reality of reason'.

Hegel fulfils his self-imposed demand for the integration of freedom by making the conception of free will the fundamental concept of his philosophy of the objective spirit; this is where his characteristic conception of freedom comes into play. According to Hegel, a will is free not because it can choose its ends from a virtually limitless number of objective alternatives; the truly free will is the will which only determines itself. For Hegel,

self-determination means to refer willingly to oneself, that is, to will oneself. Thus he thinks of freedom as a case of self-reference and in this way assimilates it into his concept of cognition, which is also based on the idea of self-reference (see §5 above). This assimilation is utterly intentional on Hegel's part, because it gives him the opportunity to interpret the process of the systematic unfolding of the various determinations of the will not only as different ways of the realization of free will but also as a process of cognition (see Freedom and liberty; Free will).

Against this background, Hegel first develops his theories of law and morality, which derive all legal relationships and the obligatory character of moral acts from the concept of free will. In his theory of law, Hegel makes his contribution to the discussion of the philosophical foundations of civil and criminal law. His basic thesis is that property, the acquisition and use of which is a presupposition for being able to act freely, is the necessary condition of law in all its different variations. In his theory of morality, Hegel discusses the moral behaviour of autonomous subjects under the aspect of the gaining of moral standpoints for the purpose of judging actions and of the conversion of moral goals into actions. According to Hegel, however, legal relationships and moral standards are *founded* in social institutions. He thinks of these institutions as forms of what he calls 'ethical life' (*Sittlichkeit*). In Hegel's language, ethical life as the basis for the possibility of law and morality is the truth of free will, that which free will really is. Since it is a characteristic of the truth of free will to be real, it follows that, for Hegel, ethical life is also the reality of free will. This reality is thus the 'presupposed whole', without reference to which the discussion of law and morality makes no sense at all. This thesis of the function of real ethical life as the basis for law and morality is intended to account for the Aristotelian maxim of the primacy of the whole in political philosophy (see Legal idealism §§1-2).

For Hegel, ethical life appears in three institutional forms: family, bourgeois society and the state. The theory of the family contains his thoughts on the ethical function of marriage, his justification of monogamy, his views on family property and the laws of inheritance and his maxims for bringing up children. The theory of bourgeois society became well-known and influential, above all because of Hegel's diagnosis of the difficulties which will arise within a society based solely on economic interests and elementary needs of its individual members. This diagnosis is grounded in Hegel's analyses of a society founded solely on economic relationships. They owe much to the works on political economy by Adam Smith, J.P. Say and Ricardo, to whom Hegel often explicitly refers. According to Hegel, a bourgeois society considered as an economic community is defined by the fact that in it people can satisfy their needs through labour. The manifold nature of these needs means that they can only be satisfied by division of labour within the society. This leads economic subjects to join together into estates (*Stände*) and corporations whose members each undertake specific tasks with regard to the socially organized satisfaction of their needs. Hegel recognizes three estates: the peasant estate, which he calls the 'substantial estate'; the tradesmen's estate, among which he includes craftsmen, manufacturers and traders; and what he calls the 'general estate', whose members fulfil judicial and policing functions. Corporations are formed mainly in the tradesmen's estate. Although this entire realm of bourgeois society organized along these lines does involve legal restrictions, and is regulated by a civil and criminal legal code, it none the less cannot remain indefinitely stable. For it is not possible to prevent the polarization of the poor majority and the rich minority which leads to overpopulation, so that eventually the entire social wealth will not suffice to satisfy even the most elementary needs of all. The consequences are colonization and the formation of the 'proletariat'. Both will tend to destroy this bourgeois society.

If one follows Hegel's arguments, bourgeois society can only avoid this fate if its members act not according to their own particular interests and needs, but recognize the state as their 'general purpose', and direct all their activities to maintaining it (see Civil society §1; State). Hegel thinks of the state as a constitutional monarchy with division of power. For Hegel, the constitution of a state is in no sense the product of some constitution-creating institution or the work of individual persons. It is 'absolutely essential that the constitution, although the product of past history, *should not be seen as a finished entity*'. A constitution is rather the manifestation of the spirit of a people, created during the course of history through their customs and traditions. This view permits Hegel to maintain on the one hand that each people has the constitution 'which is appropriate to it and fits it', and on the other to insist that there is not much leeway for the modification of constitutions. The constitutional form of a reasonably organized state must be a monarchy because its characteristic individuality can only be appropriately represented by a concrete individual to whom as a person the sovereign acts of the state can be attributed. Hegel

also favours a hereditary monarchy, since he sees the process of determining a person as monarch by virtue of its origin as the method which is least dependent upon arbitrary decisions. Hegel's theory of the powers of the state (*Staatsgewalten*) recognizes, in addition to the princely power (*fürstliche Gewalt*) which represents the instance of ultimate decision-making within the constitutional framework, the governmental power (*Regierungsgewalt*) and the legislative power (*gesetzgebende Gewalt*). It is the task of the governmental power, which for Hegel also includes the judicial power, to pursue the general interests of the state, ensure the maintenance of right and enforce the laws. The legislative power is responsible for the 'further determination' of the constitution and laws. It is executed by an assembly of the estates which is divided into two chambers. The first chamber consists of a certain group of powerful landowners chosen by virtue of their birth; the second chamber comprises representatives of the corporate associations of the bourgeois society, who are sent to the assembly by their various corporations. Thus in Hegel's model state, both chambers are constituted without the direct political involvement of the population. Hegel's theory of the state provoked considerable controversy, particularly during his own time, because of its resolute defence of the hereditary monarchy and its strongly anti-democratic characteristics in all questions concerning the political representation of the citizens of the state. It was this section of his political philosophy in particular which, as early as the mid-nineteenth century, gave rise to the statement that Hegel was the philosopher of the Prussian state.

Hegel forges the link to his theory of the spirit, which contains his political philosophy, by interpreting what he calls 'ethical life' as the 'spirit of a people'. This allows him to elaborate his conception of history on the one hand and on the other to introduce his theory of the absolute spirit. The philosophy of history is introduced by the idea that ethical life as the reality of free will takes on different forms for different peoples. These forms differ from each other in the degree to which the different institutions of ethical life are actually developed. Now, Hegel believes that this development has taken place during the course of a historical process which he calls 'world history' (see History, philosophy of). This process of world history, which he sees as 'progress in the consciousness of freedom', can be divided into four distinct epochs, which correspond to four 'empires of world history'. Hegel describes this process of world history as beginning with the 'Oriental Empire', which is followed by the 'Greek' and then by the 'Roman' empires. The process is brought to a conclusion by the 'Germanic Empire', in which the 'Germanic peoples are given the task of accomplishing the principle of the unity of divine and human nature, of reconciling…bjective truth and freedom'. Hegel now interprets this reconciliation as the conclusion of the process of the self-recognition of reason. The result of this process consists of the insight that reason *knows itself* to be the whole of reality. Thus Hegel links the theory of the objective spirit with his metaphysics of reason and can now concentrate on the various aspects of this self-knowledge of reason as a theory of absolute spirit.

Hegel's philosophy of absolute spirit contains his philosophy of art, his philosophy of religion and his theory of philosophy. Although from the very first all these subjects had a fixed place in Hegel's attempts at a system, and although his philosophies of art and religion were to become very influential (the one in the history of art and the theory of aesthetics and the other in theology), none the less these sections of Hegel's philosophy are relatively little elaborated in the works published by Hegel himself. Apart from a few sketch-like hints in his first work, *Difference between the Systems of Fichte and Schelling* (see §3 above), and the two final chapters of the *Phenomenology of Spirit*, Hegel devoted only a few paragraphs to these themes at the end of the *Encyclopedia of Philosophical Sciences*. We can gather from these paragraphs that there are three different ways in which reason, which knows itself, relates to itself; these are manifested in art, religion and philosophy. They differ from each other in the way in which in each of these ways reason knows itself. In art, reason relates to itself *intuitively* or, as Hegel says, *knows itself immediately*, while in religion this knowing relationship with itself realizes itself in the form of *representation*, which is linked with the sublation of the immediacy of knowledge. In philosophy, the self-reference of reason is accounted for in the mode of *cognition*. The theory of epistemic modes which underpins this functional analysis of art, religion and philosophy, though obviously relying on the results of the Hegelian theory of the subjective spirit, none the less contains a number of difficulties which are hard to unravel.

Against this background of different forms of knowledge, Hegel first reveals his theory of art in the form of a theory of styles of art (*Kunstformen*) and of individual arts (*Kunstarten*). He recognizes three different styles of art, which he calls symbolic, classical and romantic. They differ from each other in their various means of expressing the distinguishing characteristics of the spiritual, which belong to the sensible and therefore to the intuitive

manifestations which reason gives itself. These styles themselves are characterized by the ways in which a spiritual content presents itself as the meaning of a sensible object. The symbolic style of art is thus the one in which the relationship between meaning and sensible appearance is relatively contingent, since it only arises through a randomly chosen attribute. By way of example Hegel takes the lion, which symbolizes strength. In the classical style of art the sensible appearance expresses adequately what it is intended to signify. For Hegel, the human figure serves as a paradigm for this adequate symbolization of the spiritual, especially in the way in which it is represented in sculpture and painting. Finally, the romantic style of art takes as its subject the representation of the ‘self-conscious inwardness’ of the spirit. In it, the emotional world of the subject is expressed by reference to sensible characteristics. Hegel interprets the various individual arts as realizations of styles of art in various materials. Although each individual art can present itself in each style of art, there is for each individual art an ideal style, which he calls its basic type. The first individual art which Hegel discusses is architecture. Its task is to deal with nonorganic nature in an artful manner. Its basic type is the symbolic style of art. The second individual art is sculpture, the basic type of which is the classical style. Sculpture aims to transform nonorganic nature into the physical form of the human body. The remaining individual arts are painting, music and poetry, whose basic type is represented by the romantic style of art. Painting marks the beginning of the separation of the direct processing of natural materials and thus a certain intellectualization of matter, which makes it capable of representing feelings, emotions, etc. Music is the romantic style of art *par excellence*. Its material is sound, which is matter only in a figurative sense and is therefore particularly suitable for the representation of even the most fleeting affects. Finally poetry, the last of the romantic arts, has as its material only signs, which here play no part as material entities, but as bearers of meaning. These meanings refer to the realm of imagination and other spiritual content, so that in poetry a spiritual content can be presented in a manner appropriate to its spirituality. Hegel could not resist the temptation to use his theory of individual arts and styles of art as a model for the interpretation of the history of the development of art. His historicizing of individual arts and styles of art played a significant role in making the concept of an epoch an important tool in the history of art.

In the philosophy of religion Hegel holds that only in Christianity are the conditions fulfilled which are characteristic of the representational self-knowledge of reason. Philosophy of religion has as its subject not only God, but also religion itself, and for Hegel that means the way in which God is present in the religious consciousness. By this characterization he aims to distinguish philosophy of religion from the traditional *theologia naturalis*. On the basis of the two components which make up its nature, the philosophy of religion attempts in the first instance to characterize more closely the concept of God and the various kinds of religious consciousness which Hegel takes to be feeling, intuition and representation. This will be found in the first part of the philosophy of religion, which thematizes the ‘concept of religion’. The second part of the philosophy of religion discusses what Hegel calls ‘determinate religion’. Here, he is concerned with something resembling a phenomenology of religions, the exposition of their various forms of appearance and objectivizations. This exposition starts with so-called natural religion, which according to Hegel assumes three forms: the religion of magic, the religion of substantiality and the religion of abstract subjectivity. The specific characteristic of natural religion is that it thinks of God in direct unity with nature. Natural religion finds its historical concept in the Oriental religions. Hegel regards the ‘religions of spiritual individuality’ as a second stage; these assume the forms of the religion of sublimity, the religion of beauty and the religion of teleology. At this stage, God is regarded as the primary spiritual being, which is not only nature but which also rules over and determines nature. Hegel puts the Jewish, Greek and Roman religions in this category. Finally, the third stage represents the ‘perfect religion’, to the discussion of which he devotes the third section of his philosophy of religion. In it, God is presented as He in reality is, namely the ‘infinite, absolute end in itself’. To the religious consciousness, the God of the perfect religion appears in the trinitarian form as the unity of the Father, Son and Holy Ghost. According to Hegel, this idea of religion was first realized adequately in Christianity. Hegel’s philosophy of religion greatly influenced theological discussions and points of view. None the less, it was not without its critics, for whom it represented a theory which, as, for example, R. Haym claimed in the last century, contributed to the dissolution of the Godly in reason and of Piety in knowledge.

As far as philosophy is concerned, Hegel maintains that its distinguishing mode of knowledge, namely cognition, is present when something is seen to be necessary. Since reason within the sphere of the absolute spirit relates only to itself, the achievement of the cognitive reference of reason to itself lies in the fact that it understands the progress of its realization in logic, nature and spirit as a necessary process. Philosophy is the representation of this

process in its necessity. This philosophical process also has its appearance in time in the form of the history of philosophy. For Hegel, the history of philosophy presents itself as a historical succession of philosophical positions in which in each case one of the essential characteristics of (Hegelian) reason is made the principle of a philosophical interpretation of the world in a one-sided and distorted way that is characteristic of its time. He sees the existence of political freedom as a necessary precondition for a philosophical interpretation of the world. Only in societies in which free constitutions exist can philosophical thought develop. Since, he claims, the concepts of freedom and constitution only arose as the products of Greek (that is, occidental) thought, philosophical discourse is really a specifically Western achievement. He therefore absolutely refuses to ascribe any philosophically relevant intellectual achievements to the Oriental world, the principle proponents of which are in his view China and India. All the doctrines of wisdom of the Orient can at most be accepted as codifications of religious ideas. If, for a Westerner, some of these doctrines none the less seem to express a philosophical thought, this is because they confuse the abstract generality of Oriental religious ideas with the generality which is applicable to the thoughts of reason engaged in thinking itself. Hegel divides Western philosophy into two main periods: Greek and Germanic philosophy. Up to a certain point, Greek philosophy also includes Roman, and Germanic philosophy includes not only German philosophy but that of other European peoples as well, since these peoples have ‘in their totality a Germanic culture’. The difference between Greek and Germanic philosophy lies in the fact that Greek philosophy was not yet in a position to comprehend the conception of spirit in all its profundity. This only became possible through Christianity and its acceptance throughout the Germanic world. For only in this historical context was it possible for the insight to establish itself that the essence of spirit is subjectivity and hence knowledge of itself. Hegel regards it as a great merit of his philosophy that it adequately explains this, and thus reconciles reason with reality in thought. In the last analysis, his message consists of a single proposition: Reason is and knows itself to be the ultimate reality. His system is brought to a conclusion in what is, in his view, a successful justification of that proposition. Even during the nineteenth century, the optimism of reason underlying Hegel’s system aroused criticism, for example, from Nietzsche and the representatives of Neo-Kantianism. It seems doubtful whether, at the end of the twentieth century, Hegel’s indomitable faith in reason can continue to convince.

List of works

German editions of major works

Hegel, G.W.F. (1968-) *Gesammelte Werke*, ed. von der Rheinisch-westfälischen Akademie der Wissenschaften, Hamburg: Meiner.(This is the historical-critical edition in progress which aims at completeness. Up to the end of 1996 fifteen volumes have appeared.)

Hegel, G.W.F. (1832-45) *Werke. Vollständige Ausgabe durch einen Verein von Freunden des Verewigten*, 18 vols in 21, Berlin: Duncker & Humblot.(This is the first edition - inaugurated by an association of friends of Hegel - which contains a large amount of material from Hegel’s lectures. Of particular importance are vol. 9 *Lectures on the Philosophy of History*, vols 10, 1-3 *Lectures on Aesthetics*, vols 11-12 *Lectures on the Philosophy of Religion*, vols 13-15 *Lectures on the History of Philosophy*.)

Hegel, G.W.F. (1970) *Werke in 20 Bänden (Theorie-Werkausgabe)*, ed. E. Moldenhauer and K.M. Michel, Frankfurt: Suhrkamp.(This is a modified and slightly enlarged reprint of the 1832-45 edition.)

Hegel, G.W.F. (*c*.1793-1800) *Theologische Jugendschriften*, ed. H. Nohl, Tübingen: J.C.B. Mohr, 1907, reprinted 1968.(Collection of manuscripts and fragments written before 1801.)

Hegel, G.W.F. (1801a) *De Orbitis Planetarum*, Jena: Seidler.(Hegel’s Habilitation Essay.)

Hegel, G.W.F. (1801b) *Differenz des Fichte’schen und Schelling’schen Systems der Philosophie*, Jena: Seidler. (Hegel’s first philosophical publication.)

Hegel, G.W.F. (1802) *Glauben und Wissen oder die Reflexionsphilosophie der Subjektivität*, in *Kritisches Journal der Philosophie*, ed. F.W.J. Schelling and G.W.F. Hegel, Tübingen: Cotta.(Contains his early criticism of Kant, Jacobi and Fichte.)

Hegel, G.W.F. (*c*.1803-4) *Jenaer Systementwürfe I*, newly ed. K. Düsing and H. Kimmerle, Hamburg: Meiner, 1986.(Contains fragments of the first system draft.)

Hegel, G.W.F. (*c*.1804-5) *Jenaer Systementwürfe II*, newly ed. R.P. Horstmann, Hamburg: Meiner, 1982. (Documents his early conception of logic and metaphysics and contains a fragmentary version of his philosophy of nature.)

Hegel, G.W.F. (*c*.1805-6) *Jenaer Systementwürfe III*, newly ed. R.P. Horstmann, Hamburg: Meiner, 1987. (Incomplete versions of his philosophy of nature and of spirit.)

Hegel, G.W.F. (1807) *System der Wissenschaft. Erster Theil, die Phänomenologie des Geistes*, Bamberg & Würzburg: Goebhardt.(The famous introduction to the system.)

Hegel, G.W.F. (1812-16) *Wissenschaft der Logik*, Nürnberg: Schrag, 3 vols.(The most extensive elaboration of his metaphysical logic.)

Hegel, G.W.F. (1821) *Naturrecht und Staatswissenschaft im Grundrisse. Grundlinien der Philosophie des Rechts*, Berlin: Nicolai.(Contains his theory of law and morality as well as his social and political philosophy.)

Hegel, G.W.F. (1830) *Enzyklopädie der philosophischen Wissenschaften im Grundrisse. Dritte Ausgabe*, Heidelberg: Winter.(The last and most comprehensive version of his system.)

Hegel, G.W.F. (1952-81) *Briefe von und an Hegel*, ed. J. Hoffmeister and F. Nicolin, Hamburg: Meiner, 4 vols.(A richly commented edition of his correspondence.)

Hegel, G.W.F. (1983-) *Vorlesungen. Ausgewählte Nachschriften und Manuskripte*, Hamburg: Meiner.(Contains a large number of manuscripts which are based on student notes of Hegel’s lecture courses. Many of these manuscripts have been discovered only recently.)

Hegelianism

As an intellectual tradition, the history of Hegelianism is the history of the reception and influence of the thought of G.W.F. Hegel. This tradition is notoriously complex and many-sided, because while some Hegelians have seen themselves as merely defending and developing his ideas along what they took to be orthodox lines, others have sought to 'reform' his system, or to appropriate individual aspects and overturn others, or to offer consciously revisionary readings of his work. This makes it very hard to identify any body of doctrine common to members of this tradition, and a wide range of divergent philosophical views can be found among those who (despite this) can none the less claim to be Hegelians.

There are both 'internal' and 'external' reasons for this: on one hand, Hegel's position itself brings together many different tendencies (idealism and objectivism, historicism and absolutism, rationalism and empiricism, Christianity and humanism, classicism and modernism, a liberal view of civil society with an organicist view of the state); any balance between them is hermeneutically very unstable, enabling existing readings to be challenged and old orthodoxies to be overturned. On the other hand, the critical response to Hegel's thought and the many attempts to undermine it have meant that Hegelians have continually needed to reconstruct his ideas and even to turn Hegel against himself, while each new intellectual development, such as Marxism, pragmatism, phenomenology or existential philosophy, has brought about some reassessment of his position. This feature of the Hegelian tradition has been heightened by the fact that Hegel's work has had an impact at different times over a long period and in a wide range of countries, so that divergent intellectual, social and historical pressures have influenced its distinct appropriations. At the hermeneutic level, these appropriations have contributed greatly to keeping the philosophical understanding of Hegel alive and open-ended, so that our present-day conception of his thought cannot properly be separated from them. Moreover, because questions of Hegel interpretation have so often revolved around the main philosophical, political and religious issues of the nineteenth and twentieth centuries, Hegelianism has also had a significant impact on the development of modern Western thought in its own right.

As a result of its complex evolution, Hegelianism is best understood historically, by showing how the changing representation of Hegel's ideas have come about, shaped by the different critical concerns, sociopolitical conditions and intellectual movements that dominated his reception in different countries at different times. Initially, Hegel's influence was naturally most strongly felt in Germany as a comprehensive, integrative philosophy that seemed to do justice to all realms of experience and promised to preserve the Christian heritage in a modern and progressive form within a speculative framework. However, this position was quickly challenged, both from other philosophical standpoints (such as F.W.J. Schelling's 'positive philosophy' and F.A. Trendelenburg's neo-Aristotelian empiricism), and by the celebrated generation of younger thinkers (the so-called 'Young' or 'Left' Hegelians, such as Ludwig Feuerbach, David Strauss, Bruno Bauer, Arnold Ruge and the early Karl Marx), who insisted that to discover what made Hegel a truly significant thinker (his dialectical method, his view of alienation, his 'sublation' of Christianity), this orthodoxy must be overturned. None the less, both among these radicals and in academic circles, Hegel's influence was considerably weakened in Germany by the 1860s and 1870s, while by this time developments in Hegelian thought had begun to take place elsewhere.

Hegel's work was known outside Germany from the 1820s onwards, and Hegelian schools developed in northern Europe, Italy, France, Eastern Europe, America and (somewhat later) Britain, each with their own distinctive line of interpretation, but all fairly uncritical in their attempts to assimilate his ideas. However, in each of these countries challenges to the Hegelian position were quick to arise, partly because the influence of Hegel's German critics soon spread abroad, and partly because of the growing impact of other philosophical positions (such as Neo-Kantianism, materialism and pragmatism). Nevertheless, Hegelianism outside Germany proved more durable in the face of these attacks, as new readings and approaches emerged to counter them, and ways were found to reinterpret Hegel's work to show that it could accommodate these other positions, once the earlier accounts of Hegel's metaphysics, political philosophy and philosophy of religion (in particular) were rejected as too crude.

This pattern has continued into the twentieth century, as many of the movements that began by defining themselves against *Hegel (such as Neo-Kantianism, Marxism, existentialism, pragmatism, post-structuralism and even 'analytic' philosophy) have then come to find unexpected common ground, giving a new impetus and depth to*

Hegelianism as it began to be assimilated within and influenced by these diverse approaches. Such efforts at rapprochement began in the early part of the century with Wilhelm Dilthey's attempt to link Hegel with his own historicism, and although they were more ambivalent, this connection was reinforced in Italy by Benedetto Croce and Giovanni Gentile. The realignment continued in France in the 1930s, as Jean Wahl brought out the more existentialist themes in Hegel's thought, followed in the 1940s by Alexander Kojève's influential Marxist readings. Hegelianism has also had an impact on Western Marxism through the writings of the Hungarian Georg Lukács, and this influence has continued in the critical reinterpretations offered by members of the Frankfurt School, particularly Theodor W. Adorno, Max Horkheimer, Herbert Marcuse, Jürgen Habermas and others. More recently, most of the major schools of philosophical thought (from French post-structuralism to Anglo-American 'analytic' philosophy) have emphasized the need to take account of Hegel, and as a result Hegelian thought (both exegetical and constructive) is continually finding new directions.

1 The Hegelian School in Germany 1816-40

Initially, Hegel's influence was naturally most strongly felt in Germany, and can be seen in the relatively rapid formation within the philosopher's lifetime of something like a 'Hegelian school'. The representatives of this school procured a considerable influence for themselves not only through the personal prestige of Hegel, but also through the foundation of important journals more or less expressly designed to propagate and disseminate the philosophical principles of Hegel himself and apply them to central theoretical and practical issues of the day. But the very comprehensiveness and richness of Hegel's systematic synthesis placed his more original students in an ambiguous and paradoxical position. Eduard Gans wrote 'Hegel has left behind a number of gifted students but no successor. For philosophy has now for the first time completed the cycle of its existence; further advance can only be expected as the further intelligent penetration of the material of knowledge.'

One of the earliest explicit champions of Hegel's thought was Georg Andreas Gabler (1786-1853), a student from Hegel's Jena period 1801-07, who later succeeded to Hegel's chair in Berlin (1835) and was one of the few students to write intensively on (part of) the *Phenomenology*, with the*Kritik des Bewußtseins (Critique of Consciousness)* (1827). When Hegel moved to take up his first chair in Heidelberg in 1816 he also found an ardent supporter in the theologian Karl Daub (1765-1836), who expounded a thoroughly Hegelian approach to religious questions with *Die dogmatische Theologie jetziger Zeit (The Dogmatic Theology of Our Times)* (1833). But it was essentially during his final Berlin period (1819-31) that Hegel began to develop a proper 'School' around him, with the founding of a *Gesellschaft für wissenschaftliche Kritik* (Society for Scientific Criticism) in 1825 and the consequent launching of the journal *Jahrbücher der wissenschaftlichen Kritik (Yearbook of Scientific Criticism)* under the editorship of Hegel and his more prominent students. The journal explicitly began to disseminate a Hegelian line on contemporary philosophical and cultural issues and was soon dubbed the 'Hegel newspaper' by its opponents.

Other followers at this time who produced Hegelian interpretations in the fields of ethics, history of philosophy, speculative theology, law and political thought were Leopold von Henning (1791-1866) with his *Prinzipien der Ethik in historischer Entwicklung (Principles of Ethics in Historical Development)* (1824), Karl Ludwig Michelet (1801-93) with the *Geschichte der letzten Systeme der Philosophie in Deutschland (History of the Most Recent Systems of Philosophy in Germany)* (1837-38), Philipp Karl Marheinecke (1780-1846) with *Die Grundlehren der christlichen Dogmatik als Wissenschaft (The Fundamental Doctrines of Christian Dogmatics as Science)* (1827) and, one of the most interesting and original, Eduard Gans (1798-1839). Gans had become a friend of Hegel's in Heidelberg and strongly under his influence produced his major work *Das Erbrecht in weltgeschichtlicher Entwicklung (The Law of Inheritance Considered in its World-Historical Development)* (1824-35) which forcefully pursued Hegel's own criticism of the 'Historical School' of jurisprudence defended by Karl von Savigny. Gans also lectured on the philosophy of world history from a liberal-progressive Hegelian perspective as well as upon law and may well have been a powerful influence upon the young Karl Marx who heard him lecture in Berlin in the mid-1830s (see Marx, K. §2). These early protagonists of Hegel's thought are sometimes described as the 'Old Hegelians' because they represented the first generation of the 'School', by contrast with the later so-called 'Young Hegelians' of the 1840s, but the label is often quite uninformative about the substance of their teachings or their political and religious persuasions.

Karl Rosenkranz (1805-1879) was another of these early disciples who remained perhaps most faithful to the

original Hegelian vision but also showed himself an independent thinker in his wide-ranging oeuvre. Rosenkranz consciously strove to defend and re-articulate Hegel's position in all its dialectical complexity and, unlike most of Hegel's followers, laid particular stress upon Hegel's fundamental debt to Kant and aspects of the Enlightenment heritage. Rosenkranz expressed his faith in the Hegelian 'middle' in declaring that 'only all of his students taken together are the equal of Hegel; each one on his own account merely represents a one-sided moment of Hegel' (Rosenkranz 1840a: xxxv).

2 The Critique of Hegelian idealism 1840-70

Rosenkranz's preface to his biography of Hegel, *Hegels Leben (Hegel's Life)* (1844), reveals something of the fervent ideological climate of the early 1840s and reflects the various splits within the Hegelian school which had developed in the previous decade, not to mention the counter-reaction to Hegel's influence in the later work of Schelling, Hegel's former friend and collaborator (see Schelling, F.W.J. §4). For it was during the 1830s that the apparent solidity and impressive unity of Hegel's achievement gradually began to fissure and the potentially centrifugal tendencies of the system revealed themselves under the pressure of significant new social and cultural developments.

These divisions first appeared in theology and the philosophy of religion as Hegel's successors attempted to clarify the contemporary implications of Hegel's famous philosophical appropriation of Christianity as the 'consummate' religion corresponding to the 'absolute' perspective of the speculative system. Nevertheless, it was far from clear how much of what many of Hegel's contemporaries still took to be the essence of Christianity really was preserved and adequately reformulated in Hegel, especially traditional dogmatic beliefs concerning individual immortality and the afterlife, the personal and transcendent God of theism, the uniqueness of the incarnation and the entire eschatological dimension.

The figure who brought the interpretation of Hegel's philosophy of religion to a head under all these aspects was David Friedrich Strauss, whose *Das Leben Jesu, kritisch bearbeitet* (*The Life of Jesus, Critically Examined*) (1835-6) represents a watershed in nineteenth-century religious Protestant thought (see Strauss, D.F. §1). Hegel himself had spoken of religious language in terms of pictorial representation, symbolism and on occasion myth, but it was Strauss who fearlessly subjected the received Gospel accounts to a 'demythologizing' technique and attempted to reveal the intelligible ethical and spiritual truths misleadingly couched in archaic symbolic form in the original texts of the tradition. He not only expressed doubts about the historical verisimilitude of the stories and discounted the miraculous and supernatural elements, but also reinterpreted the idea of special revelation in terms of an unfolding historical revelation and rejected traditional accounts of Christ's uniquely divine status. Thus Strauss brought latent tensions in Hegel's legacy into the open and considerably sharpened the ensuing debate. It is in this theological context that Strauss himself first made the distinction in his *Streitschriften zur Vertheidigung meiner Schrift (Polemical Writings in Defence of My Work)* (1837) between 'right', 'centre' and 'left' positions in the spectrum of Hegelian philosophy: the right held to orthodox tradition in emphasizing divine transcendence, personal deity and the doctrine of immortality; the left dissolved the radical uniqueness and sometimes even the historicity of Christ and adopted a progressive humanistic domestication of Christianity as a social creed not so far removed from the 'religion of humanity' of Auguste Comte, (see §6); while the centre attempted the most difficult task of all, upholding the complexity of the original Hegelian 'middle' and avoiding alike the extremes of traditional theism, romantic pantheism or humanist reduction.

Some of those who attempted to negotiate this path in a sensitive and interesting way, apart from Rosenkranz, fell into neglect once the poles of the ensuing debate had ossified into fixed positions. Thus Ferdinand Christian Baur (1792-1860), although he never considered himself a strict adherent of the 'School' in any of its forms, developed in his *Die christliche Gnosis oder die christliche Religionsphilosophie in ihrer geschichtlichen Entwicklung (Christian Gnosis, or the Christian Philosophy of Religion in its Historical Development)* (1835) a kind of speculative hermeneutic of biblical texts and traditional dogmas that remained closer in certain important respects to Hegel's spirit than the investigations of Baur's pupil Strauss. And Strauss' friend Wilhelm Vatke (1806-82) brought a Hegelian perspective to the study of Judaic thought, a neglected subject at the time, with *Die Religion des alten Testaments (The Religion of the Old Testament)* (1835), and produced detailed work on central religio-philosophical questions with *Die menschliche Freiheit in ihrem Verhältniss zur Sünde und Gnade (Human Freedom in its Relation to Sin and Divine Forgiveness)* (1841). Alois Emanuel Biedermann (1819-1885) was

another thinker who engaged with the theological debates on the left and later continued to exploit Hegelian ideas in the quest for a responsible modern Christology which would avoid the pitfalls of anthropological reduction and antiquated supranaturalism in his *Christliche Dogmatik (Christian Dogmatics)* (1868).

The traditional division between 'right' and 'left', with the 'centre' being largely ignored, is an extremely inadequate intellectual shorthand that threatens to obscure rather than illuminate the complexity of the central issues, especially in the 1830s. For it is really only with the development of a radically secular and increasingly naturalistic worldview in the next couple of decades that the earlier Hegelian positions could globally be labelled as 'right-Hegelian', and it is historically anachronistic to regard thinkers such as Gans and most of Hegel's earlier students as politically 'conservative'. In fact many representatives of the 'School' supported liberal-progressive causes and were not initially disappointed by the revolutionary events of 1848.

From the end of the 1830s and throughout the 1840s the ideological fronts sharpened radically in the context of social and political thought. Thus the continuing concern with 'saving' historical Christianity through philosophy on the part of nearly all the original Hegelians came increasingly to seem an antiquated and regressive debate with the growing importance of radical humanistic political thought as the primary site of opposition to entrenched and anti-liberal state social policies in the period up to 1848. It was symptomatic of this trend when the Polish Count August von Cieszkowski reinterpreted Hegel's philosophy of religion in terms of a secularized eschatological philosophy of history with practical intent in his *Prolegomena zur Historiosophie (Prolegomena to the Wisdom of History)* of 1838. He had concluded that the ultimate logic of Hegel's thought demanded not a contemplative or predominantly theoretical relation to reality but rather a 'philosophy of action' ('praxis'). If, as Hegel had claimed, the future could not be predicted, it could nevertheless be shaped with will and consciousness: the task therefore was no longer to recognize the supposed actuality of reason, but actively to procure a place for the emerging rationality of the future. In emphasizing the open and dynamic element of Hegel's thought, stressing the immanent negativity of the dialectical 'method' at the expense of the apparently static 'system', and in elevating the active will over purely retrospective thought, Cieszkowski epitomized the Young Hegelian approach to Hegel's philosophical legacy. A similar position was adopted by Moses Hess who also preached the transformation of traditional religious ideas into an ethical programme for the future with *Die heilige Geschichte der Menschheit (The Sacred History of Humanity)* (1837).

The remarkable intellectual career of Bruno Bauer vividly illustrates these developments since he began as a protagonist of the theological Hegelian right and subsequently progressed through the centre towards a radically atheistic stance: in his *Die Posaune des jüngsten Gerichts über Hegel den Atheisten und Antichristen* (*The Trumpet of the Last Judgement upon Hegel the Atheist and Antichrist*) (1841), Bauer ventriloquized strategically from an apparently orthodox theological perspective precisely in order to reveal the ultimately heterodox and destructive implications of Hegelian philosophy for traditional Christian belief. These radical developments within the Hegelian school were most clearly registered in the journal founded by Arnold Ruge and T. Echtermeyer in 1838, the *Hallische Jahrbücher für deutsche Wissenschaft und Kunst (Halle Yearbook for German Science and Art)*. Although initially representatives of the whole spectrum of the school published articles in the journal, the general tenor of the contributions soon began to reflect the most advanced position of the left. In this respect the article 'Zur Kritik der Hegelschen Philosophie'(Towards a Critique of Hegelian Philosophy) (1839) by Ludwig proved symptomatic. Indeed it was Feuerbach's influential book *Das Wesen des Christentums* (*The Essence of Christianity*) (1841) which seemed in the eyes of many to draw the ultimate conclusions from Hegel's philosophy of religion and Strauss's development of it by 'unmasking' all theological discourse as an alienated and 'inverted' projection of human imagination and desire. He proposed to reveal through his 'transformational method' that the ultimate truth of theology is anthropology (in the sense that chemistry is the truth of alchemy). This interpretation of religion generally as a compensating 'ideology' has proved enormously influential in modern thought (see Feuerbach, L.A. §2).

Feuerbach also turned his critique of religion against Hegel's philosophy itself, and in particular against his idealism, accusing speculative philosophy of making the same mistake as theology: it prioritizes the infinite over the finite, thought over sense, the abstract over the concrete, and so ends up as a panlogistic idealism which sets essence above existence. This nominalistic attack on Hegel exerted a great influence, and marks the beginning of a turn away from idealism towards a new materialist metaphysics, as the dominant philosophical outlook ceased to be speculative and became anthropological and naturalistic.

3 The critique of Hegelian idealism 1840-70 (cont.)

Under the influence of this critique of Hegel’s idealism, those who succeeded Feuerbach among the so-called ‘Young Hegelians’ (such as Ruge, Friedrich Engels, Hess and the early Marx) extended it to include Hegel’s political thought, while at the same time this turn towards naturalism was treated as a key to the reinterpretation and radicalization of some of Hegel’s fundamental doctrines. Thus, in the first place, Ruge objected that Hegel’s ‘metaphysics of politics’ lacks a proper critical standpoint because it ‘would offer us the passing realities of history as eternal figures’, and is thereby rendered ‘impotent’: ‘Hegel undertook to present the hereditary monarch, the majority, the bicameral system, etc, as *logical necessities*, whereas it had to be a matter of establishing all these as products of history and of explaining and criticizing them as *historical existences*’ (Ruge (1842: 763) 1983: 228). In a similar vein, Marx accused Hegel of ‘logical, pantheistic mysticism’, of attempting ‘to provide the political constitution with a relationship to the abstract Idea, and to establish it as a link in the life-history of the Idea - an obvious mystification’ (Marx 1975: 69-70). It is evident, therefore, how the turn against Hegel’s idealism decisively influenced the Young Hegelians in their attitude to his *Philosophy of Right* and its place in the speculative system.

In the second place, the Young Hegelians saw the need (in Marx’s famous phrase) to locate properly the ‘rational kernel within the mystical shell’ of Hegel’s philosophy: to rescue what is valuable in Hegel from his idealistic metaphysics. So, for example, Engels argued that Hegel’s dialectical procedure, while apparently based on an abstract logic of concepts, is (as Marx’s work showed) nothing more than a *historical* method, ‘which ultimately amounts to the discovery of the general laws of motion which assert themselves as the ruling ones in the history of human society’ (Engels (1886) 1968: 612). Likewise, Marx himself took Hegel’s analysis of the estrangement between man and nature, based on his conception of nature as the ‘otherness of the idea’, and interpreted this in anthropological terms, as the separation of man from the human process of productive activity. By approaching Hegel in this heterodox manner, the Young Hegelians hoped to recover the radical historicism, humanism and social critique that lay obscured in the empty abstractions of his metaphysical idealism.

If most of the Young Hegelians of radical political persuasion tended to substitute the idea of a new collective humanity or an appropriately transformed ‘species being’ for the spiritual teleology of Hegel’s thought, it was left to Max Stirner (pseudonym of Johann Kaspar Schmidt) to develop the other individualistic extreme of the Hegelian mediation with *Der Einzige und sein Eigentum* (*The Ego and Its Own*) (1845), exalting the sovereign negativity of the singular ego in an almost proto-Nietzschean sense to create and recreate its own value systems and emancipate itself from all heteronomous givenness through tradition and previous history. In drawing the ultimate conclusions from the modern liberal emphasis upon subjective freedom Stirner’s philosophy of the liberated ‘self’ represents the extreme counter-position to Feuerbach’s and Marx’s conception of the ‘social individual’.

Alongside this revolt against idealism brought about by the turn towards naturalism and materialism by the Young Hegelians, Hegel’s alleged panlogicism also came under attack from F.W.J. Schelling and his ‘positive philosophy’, which he adopted from around 1827 until his death in 1854. This position was explicitly conceived in contrast to the ‘negative philosophy’ Schelling claimed to find in Hegel, which is confined to concepts and essences, but neglects being or existence; as a result, it overlooks the fact that it cannot answer the fundamental question ‘Why does anything exist at all? Why is there not nothing?’, and so cannot make the transition from the Idea to nature. Schelling therefore insists that Hegel fails to surmount the ‘nasty broad ditch’ between the first and second parts of the *Encyclopedia*, because concepts are mere abstractions from the empirical world, and so cannot be treated as ideal forms from which the latter can be deduced; on the contrary, the limits of Hegel’s rationalistic metaphysics are shown by the fact that existence must be taken (by us) to be an inexplicable *prius*. In attacking Hegel’s idealism in this way, Schelling began an antirationalistic revolt against his panlogicism which has become one of the fundamental critical reactions to his thought.

Another significant strand in this broadly existentialist critique of Hegel’s idealism which emerged in the 1840s lies in the assertion that Hegel is unable to grasp the reality of becoming, finitude and temporality, despite his talk of movement in his dialectical treatment of the categories. The claim (made, for example, by F.A. Trendelenburg (1802-72) and echoed by Kierkegaard) is that like all idealists, Hegel posits a world of abstract essences behind the world of time and transience, and so fails to give due weight to the reality of finite existence; where Hegel is

deceptive, however, is in the way in which he attributes a dynamic interrelation to the categories, and talks in terms of 'transition', 'development' and 'movement'. Hegel's critics insisted, however, that this talk of movement can only be figurative, and that in fact it is senseless to talk of real change and development in connection with Hegel's Logic. Hegel's followers tried to respond to this wave of anti-idealist criticism: Rosenkranz, for example, insisted in vain that Hegel was not a Platonist, to be 'reproached with offering up the world of blooming life to the idea as to a desolate Hades' (Rosenkranz (1870: 125) 1993 I: 283-4); on the contrary, he argued, Hegel saw universals as more like souls that must be embodied in concrete particulars.

None the less, the effect of this materialist and existentialist critique meant that from around 1860 only the more moderate epistemological idealism of the Neo-Kantians was taken seriously as a systematic philosophy; among those self-confessed Hegelians who remained academically active, the scope of their operations was considerably narrowed, so that Johann Erdmann (1805-92), Eduard Zeller (1814-1908) and Kuno Fischer (1824-1907) are principally known as historians of philosophy. Another figure whose considerable output reflects something of the vicissitudes of the Hegelian tradition in Germany throughout this period is the prolific writer and critic Friedrich Theodor Vischer (1807-87). His earlier works, such as *Über das Erhabene und Komische (On the Sublime and the Comic)* (1837) and the monumental *Ästhetik oder Wissenschaft des Schönen (Aesthetics or the Science of Beauty)* (1845-57), express more or less total commitment to Hegel's philosophy as a whole; but his later contributions represent a progressive abandonment of all ambitious metaphysical claims for art and religion in the modern world in favour of an increasingly sceptical and critical relationship to social reality and to the classical Hegelian project of reconciliation as he had earlier understood it.

4 Hegelianism outside Germany in the nineteenth century: France, Northern Europe and Italy

While Hegelianism in Germany was gradually eclipsed, in several other countries it continued to have an impact into the second half of the nineteenth century. Although in its earlier stages, the reception of Hegel in these countries broke little new ground, none the less an inevitable diversification occurred as Hegel's ideas were taken up in different climates of thought, while Hegel was later read both as part of the broader development of German Idealism, and as closer in outlook to some of his critics. This process has continued into the twentieth century, and has yielded some profound reassessments of his ideas.

France. Although French Hegelianism is best known for its influence on European thought in the 1930s onwards (see §6 below), France was also one of the first countries outside Germany to feel the impact of Hegel's ideas in the nineteenth century, largely due to the efforts of Victor Cousin. Having met Hegel in Heidelberg in 1817, Cousin became an enthusiastic admirer, returning several times to Germany thereafter. He helped give currency to Hegel's ideas through his lectures of 1828-9 at the École Normale in Paris, and with the advent of the July Monarchy in 1830, he was able to acknowledge Hegel's influence explicitly. In his later work, however, he was more guarded, partly due to his growing support for Schelling, and partly due to his increasingly conservative and conformist position. None the less, it was through Cousin that many in France came to know of Hegel's work (such as Pierre-Joseph Proudhon), while he also encouraged others, such as the Italian Augusto Vera (1813-85), who later translated several of Hegel's works into French.

With the advent of the Second Empire in 1852, Cousin lost his official posts, while the growing influence of Auguste Comte meant that the outlook of many thinkers in France became increasingly positivisitic. As a result, Hegel came to be viewed in a new light, as attempts were made to find a fruitful synthesis of both positions, particularly by Ernest Renan (1823-92) and Hippolyte Taine, both of whom had discovered Hegel in the 1840s. Renan sought to develop a less secularized positivism, using Hegel's conception of progress as bringing a divine consciousness into existence through the realization of reason. Taine was likewise attracted to Hegel's idea of a temporal development of reason, and tried to use it to give a historical dimension to the static metaphysics of Spinoza, while fusing the rationalism of the latter with a positivistic recognition of empirical knowledge and apparent contigency.

By the 1850s and 1860s there was a growing awareness of the critical debate surrounding Hegel that had developed in Germany, while Vera attempted to win disciples for the Hegelian cause in France with his *Introduction à la Philosophie de Hegel (Introduction to the Philosophy of Hegel)* (1855), though with little obvious success. Publications by Vera, Rosenkranz and Hegel's critic Rudolf Haym, were reviewed by Edmond Scherer in 1861, who commented that 'Hegel cannot begin to be known, and his philosophy assessed, since there

are no longer any Hegelians' (Scherer 1861: 813). He himself offered an influential assessment of what was valuable in Hegel's thought, emphasizing broadly Left Hegelian themes (such as Hegel's notion of contradiction and historical change), and analysing his *Philosophy of Right* and philosophy of religion (which he considered in relation to D.F. Strauss' *Leben Jesu*). However, positive discussion and dissemination of Hegel's ideas was brought to a halt by the Prussian invasion of France in the 1870s, as (not for the first time) he was blamed for fostering the expansionist nationalism of his country.

The credit for subsequently rehabilitating Hegel in France is usually given to Lucien Herr (1864-1926), who wrote an article on him for the *Grande Encyclopédie* (1893-4). Moreoever, as librarian at the École Normale Superieure from 1886, Herr was able to introduce a large number of philosophy students to Hegel's ideas during this period. In his article, Herr emphasized and appreciated Hegel's systematic ambitions, and placed considerable emphasis on the *Logic*. Though he did not try to resolve any of the philosophical cruxes of his thought, Herr did none the less present a reasonably clear and appealing synopsis of Hegel's views. An equally sympathetic but more partisan view of Hegel, intended as a rebuttal of positivism and Neo-Kantianism, was offered by Georges Noël in his study of Hegel's *Logic*. It is significant, too, that by this time Hegel was being recognized as an important precursor of Marxist thought, and that this rapprochement led to a less panlogistic and quietistic reading of his work (as can be seen in René Bertholet's address to the French Philosophy Society of 1907).

Northern Europe. Around the middle of the nineteenth century, Hegelian ideas had an important impact on the intellectual life of several northern European countries.

In Denmark, the person most responsible for introducing these ideas was the dramatist and man of letters Johan Ludwig Heiberg (1791-1860). Heiberg met Hegel in Berlin in 1824, and in the same year he brought out his *Om den menneskelige Frihed (On Human Freedom)*, in which he makes several references to Hegel, while using distinctly Hegelian ideas and terminology in his dispute with F.G. Howitz over this issue. Heiberg subsequently produced other works that established him as a spokesman for Hegelianism, and in June 1837 he began publication of *Perseus, Journal for den speculative Idee*. At the same time, Hegel's ideas were also being critically discussed by Poul Martin Moller (1794-1838) and Frederich Christian Sibbern (1785-1872). The former left Denmark to occupy a chair at Oslo University from 1826-31, and introduced the study of Hegel into Norway.

Among a slightly younger generation, Hegelian ideas were enthusiastically taken up by Hans Martensen (1808-84) and Rasmus Nielsen (1809-84). Martensen saw Hegel in much the same way as he presented himself - as attempting to bring modern philosophy to its highest standpoint by overcoming all previous one-sided approaches, and as therefore forming the culminating point of philosophical development. Martensen also argued that Christian orthodoxy had nothing to fear from Hegel, whom he followed in seeking to reconcile philosophy and theology by making the latter speculative, and applying the methods of philosophy to the received dogmas of the church. Nielsen also lectured and wrote extensively on Hegel, and his main work *Grundidéernes Logik (The Logic of Fundamental Ideas)* of 1864-6 gave a full account of his Hegelian views in this area. None the less, he came under the influence of Kierkegaard's attack on Hegel's treatment of religion, and so criticized Martensen's position as being too complacent in this regard. In 1860, Nielsen was joined at Copenhagen as a professor by Hans Bockner (1820-75), who also thought and wrote as a Hegelian, principally on the history of philosophy.

As well as having an influence on Hegel's reception in Denmark, Kierkegaard is clearly the most philosophically significant thinker to have responded to his work in this country. While Kierkegaard attacked Hegel from a theistic perspective, his own form of Christianity was sufficiently radical to set him apart from any standard Right Hegelian approach; his critique can rather be seen as undermining Hegel's entire project, which was apparently to provide a systematic, rational and complete conception of the world, of the sort traditionally associated with a divine understanding. In rejecting this ambition as 'comic' and 'absurd', Kierkegaard therefore gave a very special twist to some of the themes found earlier in Schelling, and so deepened this existentialist reaction to Hegel's work. Kierkegaard came to this position out of a desire to save the religious outlook from the claim (made by Martensen, for example) that this Hegelian standpoint could give Christianity a rational basis. Kierkegaard argued that this was impossible, as philosophical speculation could never assimilate both the metaphysical and ethical paradoxes of true Christian faith: that God has become man, that religious knowledge can be based on subjective feeling, and that the religiously inspired individual (such as Abraham) may act out of a purely individual sense of the will of God. Kierkegaard therefore sets Christianity *against* the Hegelian conception of philosophy and philosophical

reason, in order to demonstrate the limitations of the latter (see Kierkegaard, S.A. §2).

In Holland, Hegel's earliest follower was P.G. van Ghert (1782-1852), who was a student of his in Jena and later became his friend. A more significant spokesman for Hegelianism was G.J.P.J. Bolland (1854-1922), who, as professor at Leiden (from 1896), established a kind of Hegelian sect which later infiltrated all parts of Dutch intellectual life (J. Hessing (1874-1944), J.G. Wattjes (1879-1944) and Esther Vas Nunes (1866-1929) being his most important pupils). However, this school lost its influence after the Second World War, due to the anti-Semitic views of Bolland himself, and the extreme right-wing affiliations of his pupils.

Italy. While Gioberti and Rosmini drew in a general way on aspects of post-Kantian German Idealist metaphysics, Hegel's ideas were more explicitly introduced into mainstream Italian culture through the efforts of Augusto Vera and Bertrando Spaventa (1817-82), who founded an influential Hegelian school in Naples and expounded Hegel's social and political thought with his *Studi sull'etica hegeliana (Studies on Hegelian Ethics)* (1869). Hegelian ideas were also represented by Francesco de Sanctis (1817-83), whose classic literary history, *La storia della letteraria italiana* (*History of Italian Literature*) (1870-1) is much influenced by Hegel's aesthetics, and by Raffaele Mariano (1840-1912) and Pasquale d'Ercole (1831-1917). One of Spaventa's pupils was Antonio Labriola, who later proved to be an independent Marxist thinker who appreciated the importance of Hegel for the evolution of historical materialism. He avoided the reductive positivist interpretation of Marxism which was currently being codified as a system of 'dialectical materialism' and was not inhibited from drawing freely on his Hegelian teachers and predecessors. For him as for them the living heritage of Hegel lay in his profoundly historical conception of social and political life, not in his metaphysical ambitions. In regarding Hegel as pre-eminently a great philosopher of culture Labriola anticipated much of the later Italian reception of Hegelian thought, by Marxists and non-Marxists alike. Labriola's expressly non-positivist interpretation of Marxism as essentially a 'philosophy of praxis' rather than a supposedly scientific and comprehensive worldview was a significant precursor of the Hegelian-Marxist approach that would emerge in Germany in the 1920s.

5 Hegelianism outside Germany in the nineteenth century: America and Britain

America. In the second half of the nineteenth century, Hegel's ideas came to play an important part in the intellectual life of the USA, where two centres of Hegelian thought began to develop. The first was a loosely associated group of friends and acquaintances based at this time in Cincinnati, Ohio, the most important of whom were John Bernard Stallo (1823-1900), August Willich (1810-78) and Moncure Conway (1832-1907). Broadly speaking, the Cincinnati Hegelians offered a left-wing interpretation of his views, which stressed his conception of a cosmos 'full of life and reason' (as Conway put it), in which scientific and social progress were possible, leading to a more liberal and rational political and religious order.

A similar outlook can be found in the second centre of Hegelian ideas at this time, in St Louis. The leading figures here were Henry Conrad Brokmeyer (1826-1906) and William Torrey Harris (1835-1909). After the Civil War, members of the Kant Club in St Louis formed the Philosophical Society, inaugurated in 1866 with Brokmeyer as president, Harris as secretary, and Denton Snider (1841-1925), G.H. Howison (1834-1916), A.E. Kroeger (1837-82) and Thomas Davidson (1840-1900) among its leading members. All were to contribute articles and translations to *The Journal of Speculative Philosophy*, which Harris edited from 1867 to 1893. The *Journal* had considerable influence in making Hegelian ideas part of the mainstream philosophical discussion in America, while Harris's own large output made a major contribution to the study of Hegel's works. Many of the St Louis Hegelians (including Brokmeyer and Harris) also had important institutional positions, in which they tried to apply his ideas in the fields of government and education.

Of this group, Harris was perhaps the most successful in developing a general philosophical outlook that is clearly Hegelian in character. He argued that in its highest stage, knowledge reveals 'independence and self-relation underlying all dependence and relativity' (Easton 1966: 481); and he used this structure, as Hegel had done, to develop a dialectical conception of 'identity-in-difference' that provided the basis for his account of the universe, God's relation to the world and the place of the individual in society.

By the end of the nineteenth century, many of the major academic posts in America were occupied by self-styled idealists, who accepted Hegel's central place in this tradition of thought. At this time, Hegel in particular and idealism in general were used to come to terms with the growing impact of Darwinian ideas on theology and

philosophy, in part by using the notion of the dialectic to find reason in the process of evolution itself.

From the 1880s onwards, however, the claim by Hegel's earlier American disciples that he represented the highest point of German thought began to be challenged, as pragmatism started to make its mark in academic philosophical circles (see Pragmatism). This drew on a much broader range of idealist thinkers than just Hegel, who was no longer viewed as the culminating point of the tradition. Thus, for an influential figure such as William James, the less rationalistic and metaphysical idealism of Kant, Schopenhauer and Lotze was more congenial to his pragmatic outlook. The central target of James' attack was Hegel's 'vicious intellectualism', to which he opposed his own radical empiricism (James 1909: 105). James argued that the concrete world of experience has a different structure from the world of thought, and that the particularity of things can never be adequately conceptualized. He criticized intellectualism for substituting 'a pallid outline for the real world's richness', and (like Kierkegaard) claimed that it sought to transcend becoming and temporality by abandoning the human point of view. In voicing these misgivings about Hegel's alleged essentialism, James was developing a familiar line of criticism, but in a way that was new in the American reception of Hegel's work.

The effect of this critique can be seen in the writings of James' Harvard colleague and contemporary, Josiah Royce. Unlike James, Royce was prepared to follow through the developments in idealism that led to Hegel, and so became his most sympathetic and sophisticated interpreter in this period, basing his conception of the Absolute on Hegel's account of the concrete universal as an organic unity of individual minds. In his posthumously published lectures on 'Aspects of Post-Kantian Idealism', delivered in 1906, Royce broke new ground by laying greater stress on the *Phenomenology of Spirit* than the *Logic*, emphasizing the voluntaristic aspects of the former, as showing that 'for Hegel, thought is inseparable from will' (1919: 145). By adopting this approach, Royce hoped to show that Hegel's real intention was to portray a 'logic of passion', and of the conflicts of the will, and not a system of abstract thought; this would demonstrate the continuity of Hegel's ideas with the outlook of pragmatism.

The other leading American pragmatists, C.S. Peirce and John Dewey were also influenced by their encounter with Hegel. While Peirce was quick to distance himself from American Hegelianism as a school (entering into a sharp critical exchange with W.T. Harris in 1868), he none the less acknowledged the affinities that existed between Hegel's outlook and his own, while more broadly he may be seen as a Neo-Kantian. The greatest convergence comes in Peirce's phenomenological deduction of the categories of Firstness, Secondness and Thirdness, and his demonstration that our immediate perceptual judgments (Firstness) and our relational judgments (Secondness) require mediation by reference to generalities (Thirdness); as Peirce admits in his *Lectures on Pragmatism* (1903), this deduction echoes Hegel's opening arguments in the *Phenomenology* (see Peirce, C.S. §7). None the less, Peirce complains that Hegel appears to reduce Firstness and Secondness to Thirdness, instead of recognizing that all three categories must be present in any coherent conception of the world. In Dewey, the influence of Hegel is more diffuse, as he was attracted more to his 'dissolution of hard-and-fast dividing walls', rather than any particular doctrine, although he was prepared to defend Hegel's criticisms of Kant in his important early essay 'Kant and Philosophic Method' (1884) (see Dewey, J. §1).

Britain. If the pragmatists took Hegel seriously, this was not just because of his impact in America, but also because of the importance of Absolute Idealism in Britain in the 1880s and '90s, which represented the high point of Hegel's influence there.

In Britain, the initial reception of Hegel's work came relatively late. His ideas were given some limited attention in the writings of William Hamilton and James Ferrier, and figured briefly in the historical accounts of German Idealism by J.D. Morrell and G.H. Lewes, while the first translation (of part of Hegel's *Logic*) appeared in 1855. It was not until J.H. Stirling's *The Secret of Hegel* (1865), however, that any substantial sympathetic treatment of Hegel's work became available, and it marks the real beginning of Hegel's influence. While he was aware of the sustained critique of Hegel as a Platonic idealist and essentialist that had gained currency in Germany in the 1840s and '50s, Stirling still adopted this reading, proclaiming that for Hegel 'organic Reason (is) a self-supported, self-maintained, self-moved life, which is the all of things, the ultimate principle, the Absolute' (Stirling (1865) 1898 I: 96).

Stirling's book was followed in 1874 by a translation of Hegel's *Encyclopedia Logic* by William Wallace (1844-97), together with a long introduction entitled *Prolegomena to the Study of Hegel's Philosophy*. Like Stirling, Wallace sought to use Hegel in the critique of positivism and scientific naturalism, and interpreted his

idealism as a kind of thoroughgoing holism, while, like his American contemporaries, he sought to show how Hegel's notion of the dialectic might be used to bring out the rationality of Darwinian evolution. A similar set of concerns is reflected by Edward Caird (1835-1908) in his *Hegel* (1883), for whom 'the task of philosophy is to gain, or rather perhaps to regain, such a view of things as shall reconcile us to the world and to ourselves' (Caird 1892 I: 191). It was this search for unity that Caird found in Hegel's work, particularly in relation to the opposing claims of freedom and necessity, subject and object, God and the universe, and he therefore interpreted Hegel's Absolute as such a reconciling principle.

As well as these published accounts of Hegel's thought, a positive view of Hegel also began to emerge more indirectly, as he was taken up by the important group of idealist thinkers who were becoming increasingly influential at this time. One of the first of these was T.H. Green, who was led to read Hegel by his tutor and later colleague at Balliol, Benjamin Jowett. Green's critique of empiricism had both Kantian and Hegelian elements, while his account of self-consciousness as a single, actively self-distinguishing spiritual principle which expresses itself in temporal human intelligence reflected his understanding of Hegel's conception of *Geist*. None the less, Green declared himself unhappy with Hegel's method for arguing to this conception, stating that 'it must all be done again'. Likewise, while he was clearly helped to his own account of freedom by his reading of Hegel, he remained suspicious of what he took to be the latter's uncritical acceptance of the modern state, in which this freedom was to be realized.

This equivocal attitude is also reflected in the relation of one of the other leading British Idealists to Hegel, F.H. Bradley. Hegel's influence can be traced in Bradley's critique of Kantian ethics in his early *Ethical Studies* (1876); in his hostility to the classical empiricist's view of our experience of reality as divisible into discrete simple elements; in his treatment of judgment, the concrete universal and the problem of relations; and in his conviction that from the perspective of the Absolute, all *aporiai* in our understanding of reality would be overcome. None the less, Bradley remained critical of central aspects of Hegel's thought and method, famously dismissing his *Logic* as an 'unearthly ballet of bloodless categories', and with it the panlogist metaphysics this seemed to represent.

Bradley's contemporary Bernard Bosanquet was less openly critical of Hegel, as he developed Bradley's Hegelian approach to the logical forms of thought (such as judgment and syllogism), in order to show how in these forms, all abstraction from the whole turns out to be incoherent. Bosanquet carried this holism over into what was seen as a Hegelian conception of the individual and society, claiming that for human beings 'their true individuality does not lie in their isolation, but in that distinctive act or service by which they pass into unique contributions to the universal' (Bosanquet [1899] 1923: 170). In his work on aesthetics, Bosanquet focused attention on this aspect of Hegel's system, with his translation of the introduction to Hegel's *Lectures on Aesthetics* (1886), and his account of Hegel in his influential *History of Aesthetics* (1892).

Bosanquet was not alone among the British Idealists in offering interpretative commentaries on Hegel's work, although towards the end of the 1880s, these became increasingly critical and critically informed. A decisive moment came in 1887, with the publication by Andrew Seth (later Andrew Seth Pringle-Pattison) (1856-1931) of *Hegelianism and Personality*, in which he followed Schelling, Trendelenburg and others, and criticized Hegel's apparent panlogicism; following the Left Hegelians, he gave this attack an ethical and political dimension, arguing that by hypostatizing universality, Hegel gives priority to the species over and above the individual, a move which Seth set out to oppose with his own so-called 'Personal Idealism'. For Hegel's followers in Britain Seth therefore represented a parallel to the existentialist critique of his system already developed in Germany, but which had not been properly addressed by the British Idealists before.

In response, interpretations of Hegel emerged which played down his apparent panlogism, and instead began to treat the *Logic* as a kind of category theory. For example, in an influential article on 'Darwin and Hegel' (1890-1), D.G. Ritchie (1853-1903) argued that Hegel does not have to be read as a speculative cosmologist; rather, 'we (will) find that his logic and the whole of his philosophy consist in this perpetual "criticism of categories", i.e. in an analysis of the terms and concepts which ordinary thinking and the various special sciences use as current coin without testing their real value' (Ritchie 1890-1: 61). This approach was most fully developed in the commentaries on Hegel's system by J.M.E. McTaggart. McTaggart argued that the aim of Hegel's dialectic was to show how the categories of ordinary thought provide only partial or imperfect conceptions of the truth, which point towards a highest form of thought - the Absolute Idea - in which these imperfections are finally overcome. Where McTaggart

criticized Hegel was for underestimating the difficulty which we have, as limited intellects, in conceiving of the world in these terms, so that although he accepted the Hegelian claim that a resolution of all *aporiai* must be possible, he questioned whether such a view of reality was achievable by us. This approach to the reading of Hegel led McTaggart to emphasize the many apparent contradictions in how things appear to us (most famously, as events occuring in time), and to claim that therefore these appearances must be unreal, opening the way for him to indulge in extravagant metaphysical theorizing about ultimate reality at odds with our experience of the world.

By the beginning of the First World War, the taste for such theorizing had changed, as the Idealist's claims about the contradictory nature of how things appear to us seemed increasingly spurious, thereby disposing of the need to overcome these contradictions in a view of reality as somehow monistic, atemporal, changeless or immaterial. Anglo-Hegelian idealism was therefore increasingly viewed as irrelevant and poorly grounded by the leaders of the next generation of philosophical thinkers (such as Bertrand Russell and G.E. Moore), while at the same time the 'New Liberals' (such as J.A. Hobson and L.T. Hobhouse) submitted the idealist's theory of the 'organic' state to merciless attack, an attitude which hardened once the war against Germany had begun.

6 Hegelian influence in the twentieth century: Germany, Italy

While towards the end of the nineteenth century it may have appeared that Hegel's philosophy was destined to have only a marginal significance in twentieth-century thought, in fact its impact has been remarkable. This renewed interest in Hegel's position was made possible by a broader understanding of his project, which made many of the standard nineteenth-century criticisms (of panlogism, quietism, anti-individualism and theistic romanticism) appear crude and simplistic, reflecting a misconception of his work.

Germany. During a period in which various forms of positivist naturalism or Neo-Kantian schools dominated the German philosophical scene the Hegelian and idealist legacy generally had found some refuge within the traditional humanistic disciplines which escaped subjection to the methodological canons of the natural sciences. A broadly Hegelian approach thus survived in a largely non-systematic and non-metaphysical hermeneutic form which seemed to offer significant elements at least for the construction of an alternative methodology for the newly developing social and human sciences, the '*Geisteswissenschaften*'. Wilhelm Dilthey was particularly influential in reawakening interest in the world of early German Idealism with his path-breaking study of Hegel's early development, *Die Jugendgeschichte Hegels (The Young Hegel)* (1905). It was also under Dilthey's direct encouragement that his student Hermann Nohl first thoroughly edited and published most of Hegel's surviving early manuscripts of 1790-1800 as *Hegels theologische Jugendschriften* (*Hegel's Early Theological Writings*) in 1907, an event which inaugurated that German resurgence of interest in Hegel's philosophy during the first couple of decades of this century which culminated in the broad movement known as '*Neuhegelianismus*'. Hegel's early writings challenged the image of the systematic rationalist metaphysician of tradition and seemed rather to reveal a thinker passionately concerned with restoring a concrete sense of cultural wholeness and identification with the natural and historical world of lived experience.

The interest in Hegel and the tradition of German Idealism in general did not simply displace the still vigorous forms of Neo-Kantianism but rather entered initially into a complex symbiotic relationship with certain trends within that movement, especially the so-called Southwest School associated principally with Heinrich Rickert (1863-1936) and Wilhelm Windelband (1848-1915) (see Neo-Kantianism §4). Like Dilthey, these thinkers were attempting to develop an appropriate philosophical approach to the entire sphere of cultural and spiritual life as an autonomous domain alongside the sphere of the natural and the exact formal sciences. Many of them believed that the Kantian tradition required significant extension and supplementation to do justice to this dimension of experience and looked to Hegel in particular for intellectual resources adequate to the task. A symptomatic document for the period was Windelband's influential address of 1910, 'Die Erneuerung des Hegelianismus' (The Renewal of Hegelianism). Eventually a fully-fledged neo-Hegelian school began to form as part of a broader cultural project of German intellectual renewal, a process that was actually encouraged rather than weakened by the catastrophic experience of the First World War and the ensuing social and political instability.

An important figure in this development was Georg Lasson (1862-1932) who tirelessly promoted a strongly religious interpretation of Hegel's philosophy as the appropriate antidote to the disintegrative and sceptical tendencies and sense of cultural alienation of the time. The intrinsic philosophical significance of Lasson's work is negligible and often represents little but nationalistic edification, as in *Was heisst Hegelianismus? (What is*

Hegelianism?) (1916), but he performed an extremely important role as an indefatigable editor of Hegel's works.

Other principal figures associated with or broadly sympathetic with *Neuhegelianismus* were Hermann Glockner (1896-1978), also important as an editor of Hegel, with his synoptic monograph *Hegel* (1929-40); Nicolai Hartmann (1882-1950), who drew strongly on Hegel in his own work and provided a classical ontological interpretation of the philosopher in his *Die Philosophie des deutschen Idealismus (The Philosophy of German Idealism)* (1923-9); Richard Kroner (1884-1974) perhaps the purest and most dedicated representative of the movement, who wrote a standard neo-Hegelian history of German Idealism *Von Kant bis Hegel (From Kant to Hegel)* (1921-4) but reverted in his later writings to a more Kantian position influenced by Kierkegaard; Theodor Litt (1880-1962) who remained strongly influenced by Dilthey's philosophy of culture and Heidelberg Neo-Kantianism and later attempted to synthesize contemporary trends in a quasi-Hegelian fashion in *Denken und Sein (Thought and Being)* (1948), *Mensch und Welt (Man and World)* (1948) and *Hegel* (1953). Kroner helped to establish the journal *Logos* which functioned as the organ of the German neo-Hegelians and sympathetic Neo-Kantians during the 1920s. There were also a number of more important and original thinkers on the fringes of the movement who were profoundly influenced by the resurgence of interest in German Idealism and Hegel in particular. These included Georg Simmel, Ernst Cassirer and Franz Rosenzweig, who all engaged with central Hegelian problems in their work and occupied something of an ambiguous and contested space between Kant and Hegel.

By the end of the 1920s, in the context of the German crisis of democracy and the rise of fascism, the vague romantic and undifferentiated aspiration to living 'wholeness' as a supposed alternative to social atomism readily lent itself to ideological mystification and exploitation. Some neo-Hegelians made uncritical appeal to the idea of '*Sittlichkeit*' or concrete ethical life as a model of organic community, but increasingly detached from its original context in Hegel's elaborate conception of the rational modern constitutional state as the climax of the philosophy of history and the evolution of the consciousness of freedom. The Hegelian notion of the '*Volksgeist*' or 'spirit of the people' was also interpreted more in the spirit of Savigny and the 'Historical School' than in that of Montesquieu or even Herder, and the resulting simplification was urged in support of an illiberal communitarian ideology. Certain tendencies in this direction are clearly discernible in the works of Lasson, Glockner and in the monumental study by Theodor Haering (1884-1964) of Hegel's development, *Hegel. Sein Wollen und sein Werk (Hegel: His Project and his Work)* (1929-38). In all these authors romantic over-interpretation and a celebration of the supposedly 'irrational' character of the dialectic almost completely effaces the universalist and rationalist dimension of Hegel's thought and minimizes the significance of his relationship to Kant and eighteenth-century thought. None the less, except for similar interpretations by fascistically inclined legal theorists such as Julius Binder and Karl Larenz the official ideology showed little interest in reclaiming Hegel for the cause of National Socialism.

The significant alternative to the repristination of Hegel under the sign of cultural philosophies of life and value during this entire period was provided by the intellectual renewal of Marxist thought and the emergence of what later became known generically as 'Western Marxism' and 'Critical Theory'. The early work of Karl Korsch (1886-1961), especially his *Marxismus und Philosophie (Marxism and Philosophy)* (1930) and of Georg Lukács, with *Geschichte und Klaßenbewusstsein* (*History and Class Consciousness*) (1923), proved to be the initial stimulus for this development. Both rejected the positivist interpretation of Marxism as a scientific worldview supposedly in secure possession of the 'laws' of social and historical development and regarded the 'dialectics of nature' as a theoretical illusion and a practical irrelevance. Lukács extrapolated from Marx's mature work to his Hegelian origins and outlined a non-deterministic philosophy of praxis and potential self-liberation which owed much to Hegel's *Phenomenology*. Although Lukács later repudiated his earlier work in certain respects as 'idealist revisionism', he continued to emphasize the enduring significance of the Hegelian legacy in Marx against the Marxist-Leninist orthodoxy with *Der junge Hegel* (*The Young Hegel*) (1948), and drew equally heavily on Hegel in his own later works, like the massive study on aesthetics (*Die Eigenart des Asthetischen (The Specificity of the Aesthetic)*) (1963) and the unfinished treatise *Zur Ontologie des gesellschaftlichen Seins* (*The Ontology of Social Being*) (1971-2). The contemporary need to reinvestigate the entire relationship of Hegelian and Marxist thought was also stimulated during this period by the continual publication of previously unknown texts by both Hegel (especially the Jena writings then issued as his *Realphilosophie* in 1933) and Marx (particularly the *Economical and Philosophical Manuscripts* in 1932), writings which did much to confirm the insights of Lukács'

contested interpretation of Marx's debt to Hegel.

Herbert Marcuse was influenced in his early period by Diltheyan philosophy of life, Heidegger's existential phenomenology, and the rediscovery of Hegel's early work. After his study *Hegels Ontologie* (*Hegel's Ontology*) (1932), Marcuse turned explicitly to Marx whose thought he interpreted in a humanist manner in the light of the early Hegelian manuscripts, stressing like Lukács the key concept of alienation and the ineliminable moment of social subjectivity against more standard mechanistic interpretations. Marcuse also defended the Hegelian tradition directly against the charge of totalitarianism and articulated the deep continuity between the thought of Hegel and Marx in *Reason and Revolution* (1941). In his later work Marcuse focused on the question of the aesthetic dimension and its emancipatory potential as a prefiguring of a non-repressive relation to inner and outer nature, attempting to mediate the heritage of classical German philosophy with elements of Freudian thought.

Although Theodor-Wiesengrund Adorno repeatedly made Hegel an object of privileged critique, as in the *Drei studien zu Hegel* (*Three Studies on Hegel*) (1963), he could also be regarded as the most profoundly Hegelian of modern thinkers in terms of the fundamental themes of his philosophy and its elaborate dialectical conceptuality. His major works, *Negative Dialektik* (*Negative Dialectics*) (1966) and *Ästhetische Theorie* (*Aesthetic Theory*) (1970) are a sustained critical engagement in a Marxist spirit with the tradition of Hegel and German Idealist thought and are unintelligible without constant reference to the concepts of totality and dialectic subject-object identity. Adorno sought to reclaim the concept of reconciliation (of social antagonism, spirit and nature, universal and particular) from its apologetic use in speculative philosophy and employ it as a critical measure of existing contradiction and unfreedom. He drew strongly on Hegelian patterns of argument to criticize other thinkers, such as Kierkegaard, Husserl and Heidegger.

Italy. At the turn of the century the tradition of neo-Hegelian thought in Italy was principally represented by Benedetto Croce and Giovanni Gentile. Croce's reception of Hegelian thought was selective and highly reconstructive, in some respects paralleling the initial German renewal of Hegelian studies in Dilthey's wake. Again it was not the metaphysical dimension of Hegel's thought, but rather the doctrine of concrete spiritual agency and its self-objectification in social and cultural life which attracted Croce, as can be seen from his *Ciò che è vivo e ciò che è morto nella filosofia di Hegel* (*What is Living and What is Dead of the Philosophy of Hegel*) (1907). However, Croce's aesthetics owes at least as much to Kant in its emphasis upon the priority of intuition and the total autonomy of the art work; he also rejected the concept of aesthetic genre which was central to Hegel's historical construction of art. He also repudiated the supposed 'death of art' thesis which he influentially took to be implied in Hegel's subordination of art to religion and philosophy. However, Croce entertained no qualms about the apparent supercession of the religious dimension in speculative philosophy and his appropriation of Hegel was thoroughly immanent and humanistic.

If Croce stressed the autonomy of the different domains of spiritual activity, his erstwhile friend and collaborator Gentile followed Hegel more directly in grasping all human activities as interrelated manifestations of creative spirit. Similarly in his philosophy of art Gentile defended a less formalist position than Croce. Gentile's philosophy generally is also marked by a strong voluntarist emphasis and an ardent educational idealism that has affinities with Fichte. Croce finally broke with Gentile when the latter attempted to provide a Hegelian justification of the new, fascist 'Corporate State' as the concrete realization of ethical life. In spite of his political affiliations Gentile's thought continued to exercise a significant influence on Italian thought at both ends of the political spectrum. Hegel's influence was also strongly registered by the Marxist theoretician Antonio Gramsci through the contemporary example of Croce and Gentile. Gramsci developed a philosophy of praxis that closely paralleled Lukács' interpretation of Marx and rejected the quasi-naturalistic conception of dialectical materialism, seeking rather to transcend and preserve the heritage of bourgeois culture and philosophy and endow the Marxist perspective with the potential for cultural hegemony. As with the Western Marxists generally, Gramsci distrusted the mechanical application of any simple basis/superstructure distinction and attempted to grasp the complex mediation between social determinants and the collective self-consciousness of human agents in more dialectical fashion.

7 Hegelian influence in the twentieth century: Britain, America and France

Britain and America. The appropriation of Hegelian idealism by Croce and Gentile influenced R.G. Collingwood, who was one of Hegel's few sympathetic readers in Britain between the wars. Like the Italians, Collingwood

believed that Hegel's Platonism had stopped him properly overcoming the opposition of art and logic, feeling and thought, and in his own method of question and answer he sought to present Hegel's dialectic in less panlogistic, more historicist terms, which did not seek to escape the 'absolute presuppositions' of its time. Moreover, in taking up a Crocean approach to the historical method (summed up in Croce's dictum that 'every true history is contemporary history'), Collingwood drew attention back to Hegel's philosophy of history, from which Croce's was a critical development.

In America in this period, direct interest in Hegel had also waned, although a continuing commitment to the idealist tradition can be found in the work of W.M. Urban (1873-1952) and Brand Blanshard (1892-1966), whose coherence theory of truth refers back to the British school of Absolute Idealism, and thus indirectly to Hegel.

France. As in Germany and Italy, the view of Hegel that emerged in France in the twentieth century no longer set him in opposition to the humanistic, non-metaphysical, anti-essentialist perspective of his critics, but instead treated him as an important precursor and source of this very perspective. Within French thought, the beginnings of this reassessment can be traced back to Jean Wahl's *Le Malheur de la Conscience dans la Philosophie de Hegel (The Unhappy Consciousness in the Philosophy of Hegel)* (1929). In this work, Wahl (1888-1974) attempted to uncover a side to Hegel's thought that was darker, more romantic and less rationalistic than had previously been noticed, and to cast fresh light on the whole direction of his philosophy. He was helped towards this reinterpretation by the publication of Hegel's early writings by Dilthey and Nohl, which revealed to Wahl that Hegel's real preoccupations and concerns were close to those of a Christian existentialist like Kierkegaard, a fact that had been obscured by the speculative approach of the later Encyclopedic system. Wahl was therefore led to look anew at the *Phenomenology of Spirit*, treating it not merely as a prolegomenon to the mature system, but as the highest expression of Hegel's troubled vision; at the centre of his reading of the *Phenomenology*, Wahl placed Hegel's treatment of the Unhappy Consciousness, in which (he argued) the sense of loss is epitomized. Thus, although Wahl himself was not prepared to call Hegel an existentialist, his influential study of the *Phenomenology* showed how existentialist themes could be uncovered in Hegel's thought (see Existentialism).

In the wake of Wahl's study, the Hegel renaissance in France was taken further and given greater impetus by the work of Alexandre Kojève and Jean Hyppolite (1907-68). Kojève gave an important series of seminars on the *Phenomenology* from 1933 to 1939 at the École Pratique des Hautes Études, which was attended by many who were to become leading luminaries of French intellectual life, as well as influential interpreters of Hegel in their own right, including Maurice Merleau-Ponty, Eric Weil (1904-77), Georges Bataille and Jacques Lacan. The text of these seminars was published in 1947, and it remains one of the most challenging readings of Hegel's thought. Equally important were the efforts of Hyppolite, who published the first volume of his magisterial translation of the *Phenomenology* in 1939 and the second in 1941, and in 1946 completed his commentary on the text, entitled *Genèse et structure de la Phénoménologie de l'esprit de Hegel* (*Genesis and Structure of Hegel's Phenomenology of Spirit*).

Kojève made the master-slave dialectic the key to his treatment, into which he wove both Heideggerian and Marxist themes. He cites as an epigraph to his lecture on the *Phenomenology* Marx's comment that 'Hegel… sees *labour* as the *essence* of man, the self-confirming essence, of man' (Marx 1975: 386) and, like Marx, identifies the work of the slave as an essential moment in self-objectification. At the same time, with Heidegger he emphasizes the slave's experience of death, and his recognition of finitude, out of which the slave also feels liberation from the natural world. Kojève therefore interprets Hegel's move to idealism in this light: it is an attempt to show how the human mind can overcome the material world of nature, by creating its own world through the power of speech, language and thought, an ideological realm in which we feel at home and free. This free creativity also has a more tragic aspect, however, as it is limited and defined by an awareness of finitude and death; at the same time the capacity to die represents our liberation from the control of any transcendent creative power, such as God, and is thus the dialectical expression of our highest freedom.

Perhaps Kojève's best-known and most remarkable contribution to the interpretation of Hegel arises directly from the conjunction of Marxist and existentialist aspects in his account: for, drawing on both Heidegger and Marx, Kojève argues that for Hegel history began with the sense of otherness, and can end in the universal satisfaction of the desire for recognition, putting a stop to our urge to negate and overcome all externality. Thus Kojève arrives at a non-metaphysical, secularized conception of Hegel's philosophical history, and reads the end of his system in

anthropological, not theological terms; he therefore takes another step away from the nineteenth-century image of Hegelianism, and offers a new vision of this notoriously problematic aspect of Hegel's work.

For readers of Hegel, however, Kojève's interpretation raises almost as many problems as it solves, and many have felt (with Jean Wahl) that 'it is quite false but very interesting'. Hyppolite's approach is rather more judicious, while he too is influenced in his reading by existentialism and Marx. Like Wahl, he holds that 'unhappy consciousness is the fundamental theme of the *Phenomenology*…. The happy consciousness is either a naïve consciousness which is not yet aware of its misfortune or a consciousness that has overcome its duality and discovered a unity beyond separation. For this reason we find the theme of unhappy consciousness present in various forms throughout the *Phenomenology*' (Hyppolite 1946 I: 184; 1974: 190). Also like Wahl, Hyppolite argues that 'we find (Hegel) in his early works and in the *Phenomenology*, a philosopher much closer to Kierkegaard than might seem credible' (Hyppolite 1971 I: 93): although Hegel admittedly ends in Absolute Knowledge which seems to transcend all diremptions, the journey of consciousness is nevertheless characterized as 'the way of despair'. At the same time, Hyppolite emphasizes Hegel's foreshadowing of Marx's account of alienation, and agrees with Kojève that recognition is capable of overcoming the tension between self and other. None the less, in his later writings on Hegel (such as *Logique et existence (Logic and Existence)* and 'Essai sur la *Logique* de Hegel' ('On the Logic of Hegel')), Hyppolite gave greater weight to the *Logic* than hitherto; for, he argues, the claim to Absolute Knowledge, and the transition to the *Logic* must be made, if 'the phantom of the thing-in-itself' is to be avoided, and with it the sense that we are out of touch with Being. Hyppolite acknowledges, however, that there is a tension between this return to the Logic and metaphysics, and the more humanistic, anthropological method of the *Phenomenology*, a tension which he sees as fundamental to Hegel's thought.

It is partly thanks to this reading of Hegel by Kojève and Hyppolite that Marxism and existentialism became so interlinked in the intellectual life of post-war France; and it is clear that they helped bring about a rapprochement between Hegel and Marx in this period by treating existentialism as a kind of common ground on which Hegelianism and Marxism could be reconciled. While some (such as Althusser) remained hostile to this development, existentialism also served to bring about the same kind of reconciliation outside France, as the themes of alienation, reification and estrangement from nature were discovered in both their works.

8 Contemporary developments

In the last third of the twentieth century, Hegel has continued to have a considerable influence on philosophical thought, both as a major figure within the canon of 'continental' philosophy, and (more recently) within Anglo-American 'analytic' and post-analytic philosophy.

France. Since the end of the 1960s the reception of Hegelian thought in France has been significantly determined by successive waves of intellectual reaction to the previously dominant philosophies. The structuralist movement which partially supplanted the phenomenological and existentialist tradition tended to minimize the Hegelian elements in Marx's thought and emphasize the radical incompatibility of 'idealist' and scientifically 'materialist' approaches to the constitution of social reality. The emergence of a genealogical mode of critical discourse in Michel Foucault, the libidinal materialism of Gilles Deleuze and the postmodern pluralism of Jean Lyotard represented a decided antirealism and anti-foundationalism which questioned the central assumptions of the classical philosophical tradition and its metaphysics of truth. The pervasive influence of Nietzsche and Heidegger, and the perceptible political retreat from a hitherto powerful Marxist tradition, has conspired in the French context to produce something resembling a regnant anti-Hegelianism as a negative mirror image of the era of Kojève, Merleau-Ponty and Sartre. The critique of the metaphysical tradition of ontology and its supposed prioritizing of self-presence has inspired the ethically oriented philosophies of alterity like those of Emanuel Levinas in *Totalité et Infini* (*Totality and Infinity*) (1961) and Jacques Derrida in *Glas* (1974) respectively. For both thinkers, though in subtly distinct ways, Hegel again represents an exemplary case of all-consuming totalizing discourse and consequently a privileged object of critical analysis. What is at stake here is the claim to articulate a logic which can grasp difference positively rather than in terms of opposition, and the rejection of dialectic as an appropriate conceptual resource for this task.

Italy. Since the 1970s, the influence of alternative models of radical philosophy like French structuralism, post-structuralism and deconstruction has partially eclipsed the previous Marxist monopoly on critical social thought in Italy, while as in France, the rejection of 'grand narratives' and supposedly totalizing metaphysical

discourse has led to a developing critique of the idealist tradition as a whole, and Hegelian philosophy in particular. One result has been an increasingly scholarly and interpretative engagement with Hegel and the modern German tradition, but less evidence of any productive appropriation of dialectical thought.

Germany. After the neo-Hegelian movement of the pre-war period in Germany one cannot accurately speak of any Hegelian 'School' of thought. None the less, the significance of Hegel continued to make itself felt indirectly in the hermeneutic version of phenomenology developed by Martin Heidegger. Heidegger's reading of the European metaphysical tradition, supposedly culminating in Hegel, exercised considerable influence upon the interpretation of Hegel's thought. If Heidegger's own attitude to Hegel was problematically ambivalent, his student Hans-Georg Gadamer developed a critical but productive relationship to Hegel mediated by his appropriation of Heidegger's thought as a universal ontological hermeneutics. In *Wahrheit und Methode* (*Truth and Method*) (1960) he drew especially on Hegel's account of experience and endorsed the anti-subjectivist thrust of Hegelian philosophy in his rejection of the psychologistic hermeneutics he associated with Schleiermacher and Dilthey.

It was also in the context of the hermeneutic tradition that a distinct renewal of theological interest in Hegel first arose after the war, a development that was subsequently intensified by the social turn in modern theology with the influence of the Frankfurt School and issues of Marxist-Christian dialogue. Although Karl Barth had always emphasized the autonomy of theological discourse, his evolving thought eventually led him from an initial commitment to a paradoxical dialectic indebted to Kierkegaard towards a position of theological realism, a quasi-Hegelian insistence upon systematic objectivity grounded in the trinitarian nature of God's unreserved self-disclosure. A number of Barth's students and interpreters pursued the critical turn against exclusively existentialist emphasis upon individual subjectivity and an apparent neglect of social reality and historical revelation. Jürgen Moltmann (1926-) responded to impulses from Ernst Bloch and the Frankfurt School and adumbrated a dialectical theology of liberation with his *Theologie der Hoffnung* (*Theology of Hope*) (1965) and *Der gekreuzigte Gott* (*The Crucified God*) (1973). The work of Wolfhart Pannenberg (1928-) reflects the new confidence in systematic theology that draws comprehensively on the classical idealist tradition and Hegel's incarnational metaphysics in particular. Sharing Moltmann's insistence on an open dialectic with a liberatory eschatological dimension, Pannenberg has also attempted a qualified and critical re-appropriation of Hegelian insights. Although profoundly influenced by Heideggerean hermeneutics, Eberhard Jüngel (1934-) also pursues the arguably Hegelian insistence on the radical humanity of God in the later Barth and addresses the question of the 'death of God' through close engagement with German Idealism and the Left Hegelian tradition in his *Gott als Geheimnis der Welt* (*God as the Mystery of the World*) (1977). What unites these theologians, despite significant differences of emphasis, is the attempt to exploit the conceptual resources of the dialectical tradition to overcome the abstract antithesis of atheism and theism and restate the trinitarian character of spirit.

Naturally Hegel also remained a permanent point of reference for the more orthodox strains of Marxism in Germany throughout this period. None the less, the most significant and vital engagement with the Hegelian tradition was still to be found among the heirs of the Frankfurt School and those broadly sympathetic to the aspirations of Critical Theory. Thus Jürgen Habermas has responded intensively to aspects of Hegel's thought in his reformulation of an emancipatory social philosophy. While rejecting Hegel's supposed metaphysical philosophy of identity in favour of a quasi-transcendental account of irreducible constitutive interests, Habermas exploited Hegel's insights into the communicative dimension of social interaction and the centrality of the concept of recognition. In contrast with his predecessors, Habermas has attempted to reorient critical theory through the turn to intersubjectivity as an alternative to traditional philosophy of consciousness. In his later work, *Der philosophische Diskurs der Moderne* (*The Philosophical Discourse of Modernity*) (1985), Habermas recognizes Hegel's contribution to the formulation of the concept of modernity and pursues a post-metaphysical appropriation of aspects of the idealist tradition for a non-foundational universalist ethics.

Karl-Otto Apel (1922-) originally revealed the influences of Heideggerian hermeneutics, philosophical anthropology and Litt's neo-Hegelian idealist philosophy, subsequently modified by an increasing interest in Critical Theory. Like Habermas, Apel's critical relation to the tradition was motivated by the accommodations and failures of pre-war historicist philosophies of culture and ossified Marxism in the face of authoritarianism on right and left. Accepting fundamental features of Hegel's critique of Kant, he has drawn extensively on the American idealist and pragmatic tradition of Royce and Peirce in his *Transformation der Philosophie* (*Towards a Transformation of Philosophy*) (1973) to develop a social conception of the rational community as the ultimate

normative presupposition of enquiry. Apel is committed to the dialectical mediation of abstract alternatives in contemporary philosophy and overcoming the opposition between rational grounding and practical ethical orientation in transcendental self-reflection, employing Kantian and Hegelian elements as mutual correctives of one another. The communicative turn and the question of intersubjectivity is also central for Michael Theunissen (1932-) who has interpreted and productively appropriated aspects of Hegel in sustained interaction with Kierkegaard and constant conjunction with developments in contemporary thought. In his attempt to relate the insights of dialogical and dialectical thought his work reflects all the different currents of existential phenomenology, theology and critical theory in which Hegel has been a latent presence or critical point of reference throughout the century.

Britain and North America. Until recently Hegel was left largely unread by those working within the 'analytic' tradition of Anglo-American philosophy, while the issues raised by Hegelian idealism were only discussed by those at the margins of this movement, such as J.N. Findlay (1903-87) and G.R.G. Mure (1893-1979). Since the 1970s, however, respect for Hegel's thought has grown, partly because of his influence on the communitarian and historicist ideas of Charles Taylor and Alasdair MacIntyre, and partly because Hegel's attack on the Kantian division of 'form' and 'matter' in experience has been echoed by those (such as Donald Davidson, Hilary Putnam and Richard Rorty) who question the scheme/content distinction in epistemology, and who thereby seek to go beyond Kant's 'subjective idealism' in a somewhat Hegelian manner.

Thus, as the 'continental' and 'analytic' traditions have come together over the question of how far metaphysics is possible after the Kantian turn, the current intellectual landscape is characterized by a continuing interest in examining, clarifying and exploiting the conceptual resources of the German Idealist tradition, for which the interpretation, appropriation and contestation of Hegelian philosophy will inevitably represent a permanent point of reference.

For reasons of space, some of the works cited in the text are not given in the bibliography below, but are cited in the respective biographical entries of the particular author.

1 Primary literature

Stern, R. (ed.) (1993) *G.W.F. Hegel: Critical Assessments*, London: Routledge, 4 vols.(The first two volumes contain a selection of the main writings in Hegel's nineteenth- and twentieth-century reception.)

2 Germany

Adorno, T.W. (1963) *Drei Studien zu Hegel*, Frankfurt: Suhrkamp; trans. S.W. Nicholsen and J.J. Shapiro, *Hegel: Three Studies*, Cambridge, MA, and London: MIT Press, 1993.(Adorno's most explicit critique and appropriation of Hegel.)

Adorno, T.W. (1966) *Negative Dialektik*, Frankfurt: Suhrkamp; trans. E.B. Ashton, *Negative Dialectics*, London: Routledge, 1973.(Adorno's major engagement with Kant, Hegel and Heidegger, informed throughout by his transformation of 'speculative' Hegelian concepts into a critical and 'negative' dialectic.)

Adorno, T.W. (1970) *Ästhetische Theory*, Frankfurt am Main: Suhrkamp; trans. C. Lenhardt, *Aesthetic Theory*, London: Routledge & Kegan Paul, 1984.

Apel, K.-O. (1973) *Transformation der Philosophie*, Frankfurt: Suhrkamp; trans. G. Adey and D. Frisby, *Towards a Transformation of Philosophy*, London: Routledge, 1980.(Extensive essay collection presenting Apel's attempt to mediate the extremes in contemporary philosophy by recourse to the hermeneutic and pragmatic traditions.)

Bauer, B. (1841) *Die Posaune des jüngsten Gerichts über Hegel den Atheisten und Antichristen*, Leipzig: Otto Wiegand; repr. Aalen: Scientia, 1969; trans. L.S. Stepelevich, *The Trumpet of the Last Judgement Against Hegel the Atheist and Antichrist. An Ultimatum*, Lewiston, NY: Mellen, 1989.(Argues for the incompatibility

of Hegelian philosophy with traditional Christian belief.)

Baur, F.C. (1835) *Die christliche Gnosis oder die christliche Religionsphilosophie in ihrer geschichtlichen Entwicklung (Christian Gnosis, or the Christian Philosophy of Religion in its Historical Development)*, Tübingen: Osiander.(Traces the evolution of the Gnostic theological tradition up to and including Hegel and German Idealism.)

Biedermann, A.E. (1849) *Unsere junghegelianishe Weltanschauung oder der sogennante neueste Pantheismus (Our Young Hegelian Worldview, or the so-called latest Pantheism)*, Zurich: F. Schultheiss.(A critical response to a theological polemic directed against the 'Tübingen School' and Hegel's influence.)

Biedermann, A.E. (1868) *Christliche Dogmatik (Christian Dogmatics)*, Berlin: Georg Reimer; 2nd edn, 1884-5. (A late example of a broadly Hegelian and reconstructive exposition of traditional doctrines which questions the 'personality' of God.)

Cieszkowski, A. von (1838) *Prolegomena zur Historiosophie (Prolegomena to The Wisdom of History)*, Berlin: Viet.(Cieszkowski's major study, revising Hegel's philosophy of history.)

Daub, K. (1833) *Die dogmatische Theologie (The Dogmatic Theology of Our Times)*, Heidelberg: J.B. Mohr.(A standard and cautious early Hegelian interpretation of traditional theological topics.)

Dilthey, W. (1905) *Die Jugendgeschichte Hegels (The Young Hegel)*, Abhandlungen der Königlich Preussiche Akademie der Wissenchaften; repr. *Wilhelm Diltheys gesammelte Schriften*, vol. 4, Leipzig and Berlin: D.G. Teubner, 1921.(Led to an important reassessment of Hegel's early writings.)

Engels, F. (1886) *Ludwig Feuerbach und der Ausgang der klassischen deutschen Philosophie*, in *Die neue Zeit*; trans. *Ludwig Feuerbach and the End of Classical German Philosophy*, in K. Marx and F. Engels, *Selected Works in One Volume*, London: Lawrence & Wishart, 1968, 596-632.(Traces the development from Hegel to dialectical materialism.)

Erdmann, J.E. (1834-53) *Versuch einer wissenschaftlichen Darstellung der Geschichte der neueren Philosophie (Attempt at a Scientific Presentation of the History of Modern Philosophy)*, Leipzig: Riga & Dorpat, 6 vols. (One of the most comprehensive and magisterial Hegelian accounts of philosophy from Descartes to Hegel. Very incisively written.)

Erdmann, J.E. (1841) *Grundriß der Logik und Metaphysik (Outline of Logic and Metaphysics)*, Halle: J.H. Lippert; 5th edn, 1875.(Succinct and careful restatement of the essential categories of Hegel's Logic.)

Erdmann, J.E. (1865-7) *Grundriß der Geschichte der Philosophie*, Berlin: Wilhelm Hertz, 2 vols; 4th edn, 1895-6; trans. W.S. Hough, *A History of Philosophy*, London: Swan Sonnenschein, 3 vols, 1890.(Influential classic history of philosophy, thoroughly and carefully written from a Right Hegelian perspective.)

Feuerbach, L. (1839) 'Zur Kritik der Hegelschen Philosophie', in *Sämtliche Werke*, Leipzig: Otto Wigand, 1846-, vol. 2, 185-232; trans. Z. Hanfi, 'Towards a Critique of Hegelian Philosophy', in Z. Hanfi (ed.) *The Fiery Brook: Selected Writings of Ludwig Feuerbach*, New York: Anchor Books, 1972; also in L.S. Stepelevich (ed.) (1983) and R. Stern (ed.) (1993), I: 100-30. (This work established Feuerbach's position as a spokesman for the Hegelian Left.)

Feuerbach, L. (1841) *Das Wesen des Christentums*, in *Sämtliche Werke*, Leipzig: Otto Wigand, 1846-, vol. 7; trans. M.A. Evans (George Eliot), *The Essence of Christianity*, 1854; new edn, New York: Harper & Row, 1957.(Feuerbach's most famous work, in which he puts forward most clearly the Left Hegelian critique of religion and metaphysics.)

Feuerbach, L. (1842) *Vorläufige Thesen zur Reformation der Philosophie (Provisional Theses Towards the Reform of Philosophy)*, in *Sämtliche Werke*, Leipzig: Otto Wigand, 1846-, vol. 2, 244-88.(Develops Feuerbach's humanistic materialism.)

Feuerbach, L. (1843) *Grundsätze der Philosophie der Zukunft*, in *Sämtliche Werke*, Leipzig: Otto Wigand, 1846-, vol. 2, 269-346; trans. M.H. Vogel, *Principles of the Philosophy of the Future*, Indianapolis, IN, and New York: Bobbs-Merrill, 1966.(Develops Feuerbach's materialist and humanistic critique of Hegel.)

Fischer, K. (1852) *System der Logik und Metaphysik oder Wissenschaftslehre (System of Logic and Metaphysics or Doctrine of Science)*, Stuttgart: C.P. Scheitlin; 3rd edn, 1909.(Lucid and brief exposition of Hegel's logical doctrines.)

Fischer, K. (1852-77; 1897-1904) *Geschichte der neueren Philosophie (History of Modern Philosophy)*, 10 vols in 11, Heidelberg: Carl Winters Universitätsbuchhandlung.(A classic, massively detailed history of philosophy from Descartes to Schopenhauer, with the concluding two-volume monograph on Hegel.)

Gabler, G.A. (1827) *Kritik des Bewußtseins (Critique of Consciousness)*, Leiden: A.H. Adriani; 2nd edn, 1901. (One of the very few early examinations of Hegel's *Phenomenology*, written by Hegel's follower and successor in Berlin.)

Gadamer, H.-G. (1960) *Wahrheit und Methode*, Tübingen: J.C.B. Mohr; trans. W. Glen-Doepel, *Truth and*

Method, London: Sheed & Ward, 1979.(Gadamer’s hermeneutic reappropriation of Hegel’s concept of experience from a Heideggerian perspective.)

Gadamer, H.-G. (1971) *Hegels Dialektik: Fünf hermeneutische Studien*, Tübingen: J.C.B. Mohr; trans. P. Christopher Smith, *Hegel’s Dialectic: Five Hermeneutical Studies*, New Haven, CT, and London: Yale University Press, 1976.(Perceptive examination of key themes in Hegel in relation to the classical tradition and Heidegger.)

Gans, E. (1824-35) *Das Erbrecht in weltgeschichtlicher Entwicklung (The Law of Inheritance Considered in its World-Historical Development)*, vols 1 and 2, Berlin: Maurische Buchhandlung; vols 3 and 4, Stuttgart and Tübingen: Cotta.(The major Hegelian contribution to the history of law, written in conscious opposition to the ‘Historical School’.)

Glockner, H. (1929-40) *Hegel*, Stuttgart: Frommann, 2 vols.(Typical expression of vitalist neo-Hegelianism, emphasizing the cultural concreteness and historical richness of Hegelian thought.)

Glockner, H. (1931) ‘Hegelrenaissance und Neuhegelianismus’ (The Hegel Renaissance and Neo-Hegelianism), *Logos* 20; repr. with other contributions in *Hegel-Studien*, Beiheft 2, Bonn: Bouvier.(A historical account of the early twentieth-century Hegel revival in Germany by one of the leading participants.)

Habermas, J. (1968) *Erkenntnis und Interesse*, Frankfurt: Suhrkamp; trans. J.J. Shapiro, *Knowledge and Human Interest*, Oxford: Polity Press, 1987.(Part 1 contrasts Hegel’s critique of knowledge with that of Kant and Marx.)

Habermas, J. (1971) *Theorie und Praxis*, Frankfurt: Suhrkamp, 4th edn; trans. J. Viertel, *Theory and Practice*, Oxford: Polity Press, 1973.(Contains several influential essays on Hegel.)

Habermas, J. (1985) *Der philosophische Diskurs der Moderne*, Frankfurt: Surhkamp; trans. F. Lawrence, *The Philosophical Discourse of Modernity*, Cambridge, MA: MIT Press, 1987.(Traces the critique of modernity as it developed after Hegel.)

Haering, T. (1929-38) *Hegel. Sein Wollen und sein Werk (Hegel: His Life and his Works)*, Leipzig and Berlin, 2 vols; repr. Aalen: Scientia, 1979.(Enormous genetic study of Hegel’s thought from 1790-1807, stressing Hegel’s practical and political concerns. Typical of the organic ‘communitarian’ interpretation of conservative neo-Hegelianism.)

Hartmann, N. (1923, 1929) *Die Philosophie des deutschen Idealismus (The Philosophy of German Idealism)*, Berlin and Leipzig, 2 vols; 3rd edn, repr. Berlin: de Gruyter, 1974.(An important ontological and ‘realist’ reading of Hegel, emphasizing his systematic ambitions and debt to the classical tradition.)

Haym, R. (1857) *Hegel und seine Zeit (Hegel and his Times)*, Berlin: Rudolph Gaertner.(Contains an influential attack on Hegel as an apologist for the Prussian Restoration.)

Henning, L. von (1824) *Prinzipien der Ethik in historischer Entwicklung (Principles of Ethics in Historical Development)*, Berlin: Friedrich August Herbig.(A lucid brief outline of the history of ethics, dedicated to Hegel.)

Hess, M. (1837) *Die heilige Geschichte der Menschheit (The Sacred History of Humanity)*, Stuttgart: Hallberg’sche Verlagshandlung.(Important document of the transformation of Hegel’s philosophy of history as a secularized eschatology.)

Jüngel, E. (1977) *Gott als Geheimnis der Welt*, Tübingen: J.C.B. Mohr, trans. D.L. Guder, *God as the Mystery of the World*, Edinburgh: T. & T. Clark, 1983.(A magisterial contribution to philosophical theology, influenced by Barth and Heidegger, which engages seriously and productively with Hegel and the Left Hegelian tradition.)

Korsch, K. (1930) *Marxismus und Philosophie*, Leipzig: C.L.Hirschfeld, trans. F. Halliday, *Marxism and Philosophy*, London: New Left Books, 1970.(This work reopened the question of Marx’s debt to Hegelian idealism.)

Kroner, R. (1921-4) *Von Kant bis Hegel (From Kant to Hegel)*, Tübingen: Mohr Verlag, 2 vols; 3rd edn, repr. 1977.(The most substantial single product of neo-Hegelianism, interpreting Hegel as the fitting culmination of the entire tradition of classical and idealist thought from a Christian perspective.)

Lasson, G. (1916) *Was heißt Hegelianismus? (What is Hegelianism?)*, Berlin: Reuther & Reichard.(An uncritical and enthusiastic neo-Hegelian manifesto from a rather nationalistic perspective.)

Litt, T. (1948) *Denken und Sein (Thought and Being)*, Zurich: S. Hirzel.(Attempts to apply reformed Hegelian categories to central metaphysical and epistemological questions.)

Litt, T. (1948) *Mensch und Welt (Man and World)*, Heidelberg: Quelle & Meyer, 1961.(A quasi-Hegelian reinterpretation of philosophical anthropology, strongly influenced by Dilthey.)

Litt, T. (1953) *Hegel*, Heidelberg: Quelle and Meyer.(An appreciative assessment and reconstruction of Hegel, but critical of allegedly panlogistic and totalizing elements.)

Lüwith, K. (ed.) (1962) *Die Hegelsche Linke (The Hegelian Left)*, Stuttgart: Frommann-Holzboog.(Selected texts

by members of the Left Hegelian school.)

Lübbe, H. (ed.) (1962) *Die Hegelsche Rechte (The Hegelian Right)*, Stuttgart: Frommann-Holzboog.(Selected texts by members of the Right Hegelian school.)

Lukács, G. (1923) *Geschichte und Klassenbewußtsein*, Berlin: Der Malik-Verlag; repr. in *Werke*, Berlin: Luchterhand, vol. 2, 1968; trans. R. Livingstone, *History and Class Consciousness*, London: Merlin, 1971. (Enormously influential statement of the Hegelian dimension of Marxian thought which broke with the prevailing mechanistic and deterministic approach.)

Lukács, G. (1948) *Der junge Hegel*, Zurich: Europa, 2 vols; trans. R. Livingstone, *The Young Hegel*, London: Merlin, 1975.(Classical Marxist account of Hegel's development, implicitly written to correct vulgar Marxist readings of the idealist background.)

Lukács, G. (1963) *Ästhetik (Aesthetics)*, Berlin: Luchterhand; repr. in *Werke*, Berlin: Luchterhand, 1968, vols 11-12.(The most sustained example of a Marxian appropriation of classical German Idealist aesthetics and the concept of 'mimesis'.)

Lukács, G. (1971-2) *Zur Ontologie des gesellschaftlichen Seins*, Neuwied and Berlin: Luchterhand; trans. D. Fernbach, *The Ontology of Social Being*, London: Merlin, 1978-80, 3 vols.(Part of a projected larger work that was to present a systematic materialist version of the Hegelian legacy.)

Marcuse, H. (1932) *Hegels Ontologie*, Frankfurt: Klostermann; 3rd edn, repr. 1975; trans. S. Benhabib, *Hegel's Ontology*, Cambridge, MA: MIT Press, 1987.(An interesting dynamic and ontological interpretation of Hegel's Logic in the light of the *Phenomenology* and the earlier writings.)

Marcuse, H. (1941) *Reason and Revolution*, London: Oxford University Press.(Emphasizes the fundamental continuity between Hegel and Marx and offers a qualified defence of Hegel's political philosophy against its liberal critics.)

Marheinecke, P.K. (1819) *Die Grundlehren der christlichen Dogmatik als Wissenschaft (The Fundamental Doctrines of Christian Dogmatics as Science)*, Berlin: F. Dummler; 2nd edn, Duncker & Humblot, 1827.(One of the first thoroughgoing applications of Hegel's thought to Christian theology as a whole.)

Marx, K. (1843) 'Zur Kritik der Hegelschen Rechtsphilosophie', *Deutsch-Französische Jahrbücher*, issues 1 and 2; trans. R. Livingstone and G. Benton, *Critique of Hegel's Philosophy of Right*, in L. Colletti (ed.) *Early Writings*, Harmondsworth: Penguin, 1975, 57-198.(Offers a fundamental critique of Hegel from a Left Hegelian perspective.)

Marx, K. (1975) *Early Writings*, trans. R. Livingstone and G. Benton, Harmondsworth: Penguin.(A useful paperback edition, which contains Marx's posthumously published 'Critique of Hegel's Doctrine of the State' and 'Economic and Philosophical Manuscripts' and his (1844), as 'A Contribution to the Critique of Hegel's Philosophy of Right'.)

Michelet, K.L. (1837-8) *Geschichte der letzten Systeme der Philosophie in Deutschland von Kant bis Hegel (History of the Most Recent Systems of Philosophy in Germany from Kant to Hegel)*, Berlin: Dunker and Humblot, 2 vols.(A lucid history of German idealism by a representative of the liberal Hegelian 'centre'.)

Moltmann, J. (1965) *Theologie der Hoffnung*, Munich: Kaiser; trans. J.W. Leitch, *Theology of Hope*, London: SCM Press, 1967.(Indicative of reaction against existentialist dialectics and a renewed theological interest in the social dimension of the German Idealist tradition.)

Moltmann, J. (1972) *Der gekreuzigte Gott*, Munich: Chr Kaiser; trans. R.A. Wilson and J. Bowden, *The Crucified God*, London: SCM Press, 1974.(Approach to a liberation theology of the cross influenced by Marxist-Christian dialogue.)

Pannenberg, W. (1967) *Grundfragen systematischer Theologie (Fundamental Questions of Systematic Theology)*, Göttingen: Vandenhoek & Ruprecht.(Draws on Hegel and idealist thought to articulate a rational philosophical theology and defend the concept of progressive historical revelation.)

Rosenkranz, J.K.F. (1837) *Psychologie, oder die Wissenschaft vom subjektiven Geistes (Psychology, or the Science of Subjective Spirit)*, Königsberg: Bornträger.(A succinct outline of the Hegelian philosophy of mind.)

Rosenkranz, J.K.F. (1840a) *Kritische Erläuterungen des Hegelschen Systems (Critical Exposition of the Hegelian System)*, Königsberg: Bornträger.(Interesting collection of sympathetic essays on various aspects of Hegel, reflecting many of the debates within the school in the 1830-40 period.)

Rosenkranz, J.K.F. (1840b) *Geschichte der Kantischen Philosophie (History of Kantian Philosophy)*, Leipzig: Leopold Voss; repr. in J.K.F. Rosenkranz and F.W. Schubert (eds) *Immanuel Kants sämmtliche Werke*, vol. 12. (A supplement to Rosenkranz's edition of Kant's works indicating the 'completion' of Critical Philosophy in Hegelian idealism.)

Rosenkranz, J.K.F. (1844) *Hegels Leben (Hegel's Life)*, Berlin; repr. Darmstadt: Wissenschaftliche Buchgesellschaft, 1988.(Rosenkranz's official biography of Hegel.)

Rosenkranz, J.K.F. (1858-9) *Wissenschaft der logischen Idee (Science of the Logical Idea)*, Köningsberg: Borntrager, 2 vols; repr. Osnabruck: Zeller, 1972.(A major critical reworking of Hegel's Logic.)
Rosenkranz, J.K.F. (1870) *Hegel als deutscher Nationalphilosoph (Hegel as German National Philosopher)*, Leipzig: Duncker & Humblot; extracts translated in Stern (ed.) 1993, vol. 1, 256-297.(A contemporary study of Hegel's thought and influence.)
Ruge, A. (1842) 'Hegels Rechtsphilosophie und die Politik unserer Zeit', *Deutscher Jahrbücher* 189, 190; trans. J.A. Massey, 'Hegel's *Philosophy of Right* and the Politics of Our Times', in L.S. Stepelevich (ed.), *The Young Hegelians*, Cambridge: Cambridge University Press, 211-36.(Offers a critique of Hegel from a Young Hegelian standpoint.)
Schelling, F.W.J. (1833-4) *Zur Geschichte der neueren Philosophie*, in *Sämtliche Werke*, ed K.F.A. Schelling, 14 vols, Stuttgart: Cotta, 1856-91, vol. 10: 1-200; trans. A. Bowie, *On the History of Modern Philosophy*, Cambridge: Cambridge University Press, 1994.(Contains the text of Schelling's important critical lectures on Hegel given in Munich and later in Berlin, from the perspective of Schelling's own 'positive philosophy'.)
Stepelevich, L.S. (ed.) (1983) *The Young Hegelians*, Cambridge: Cambridge University Press.(An anthology of writings by Strauss, Cieszkowski, Feuerbach, Bruno Bauer, Ruge, Edgar Bauer, Engels, Marx, Stirner, Hess and Schmidt.)
Stirner, M. (1845) *Der Einzige und sein Eigentum*, Leipzig: Otto Wigand; 2nd edn, 1882; trans. D. Leopold, *The Ego and Its Own*, Cambridge: Cambridge University Press, 1994.(Takes Hegel's concept of the modern subject to an individualist extreme.)
Strauss, D.F. (1835-6) *Das Leben Jesu, kritisch bearbeitet*, Tübingen: Osiander; trans. M.A. Evans (George Eliot), *The Life of Jesus*, London: Chapman Brothers, 1846; repr. Philadelphia: Fortress, 1972.(A seminal work of nineteenth-theology which undermined traditional conceptions of scripture and profoundly influenced theological 'modernism'.)
Strauss, D.F. (1837-8) *Streitschriften zur Verteidigung meiner Schrift (Polemical Writings in Defence of My Work)*, Tübingen: Osiander.(Spirited defence of the *Life of Jesus* which gives a good sense of the theological polemics of the period.)
Theunissen, M. (1970) *Hegels Lehre vom absoluten Geist als theologisch-politischer Traktat (Hegel's Doctrine of Absolute Spirit as Theological-Political Treatise)*, Berlin: de Gruyter.(Major sympathetic exposition of Hegel's religious philosophy which attempts to undercut standard Left and Right interpretations.)
Theunissen, M. (1980) *Sein und Schein (Being and Appearance)*, Frankfurt: Suhrkamp.(Pursues an 'intersubjective' approach to the claims of Hegel's Logic as a potential theory of communicative freedom.)
Trendelenburg, F.A. (1840) *Logische Untersuchungen (Logical Investigations)*, Leipzig: S. Hirzel; 2nd edn, 1862.(An influential critique of Hegel's Logic.)
Trendelenburg, F.A. (1843) *Die logische Frage in Hegels System (The Logical Question in Hegel's System)*, Leipzig: F.A. Brockhaus.(Further develops his critique of Hegel's Logic.)
Vatke, W. (1835) *Die Religion des alten Testaments (The Religion of the Old Testament)*, Berlin: G. Bethge. (Important early treatment of the then-neglected area of Judaism from a Hegelian perspective.)
Vatke, W. (1841) *Die menschliche Freiheit in ihrem Verhältniss zur Sünde und zur göttlichen Gnade (Human Freedom in its Relation to Sin and Divine Forgiveness)*, Berlin: Bethge.(Applies Hegel's philosophy of spirit to elucidate classical theological questions concerning guilt and forgiveness.)
Vischer, F.T. (1837) *Über das Erhabene und Komische (On the Sublime and the Comic)*, ed. W. Oelmüller, Frankfurt: Suhrkamp, 1967.(Reprinted with other essays, this essay gives a thoroughly humanistic Left-Hegelian approach to an area rather neglected by Hegel.)
Vischer, F.T. (1846-54) *Ästhetik oder Wissenschaft des Schönen (Aesthetics or the Science of Beauty)*, Reutlingen & Leipzig: Carl Mäckens, 6 vols.(The largest Hegelian contribution to aesthetics which supplements Hegel by examining the question of natural beauty and the psychology of imagination.)
Windelband, W. (1910) 'Die Erneuerung der Hegelianismus' (The renewal of Hegelianism), *Sitzungsberichte der Heidelberger Akademie der Wissenschaften* 1 (10); repr. in W. Windelband, *Präludien*, Tübingen: J.C.B. Mohr, 6th edn, 1919, 273-89. (An important expression of the German resurgence of interest in Hegel at the beginning of the twentieth century.)
Zeller, E. (1844-52) *Die Philosophie der Griechen (Philosophy of the Greeks)*, 3 vols in 2, Tübingen: Friedrich Fues.(Very influential standard history of ancient philosophy from a Hegelian perspective which was widely studied and translated.)

3 France

Althusser, L. (1970) 'Sur le Rapport de Marx à Hegel', in J. D'Hondt (ed.) *Hegel et la pensée moderne*, Paris:

Presses Universitaires de France; trans. B. Brewster, 'Marx's Relation to Hegel', in *Politics and History*, London and New York: Verso, New Left Books, 1972; repr. in Stern (ed.) (1993) vol. 2, 511-28.(Argues that Marx understood Hegel's dialectic in terms of process.)

Bataille, G. (1955) 'Hegel, le mort et le sacrifice' (Hegel, Death and Sacrifice), *Deucalion* 5: 21-43; trans. J. Strauss, in A. Stoekl (ed.) *On Bataille*, New Haven, CT: Yale University Press, 1990.(A response to Kojève's reading of Hegel.)

Bertholet, R. (1907) 'Thèse: Sur la nécessité, la finalité et la liberté chez Hegel' (Thesis: On Necessity, Finality and Liberty in Hegel), *Bulletin de la Société française de philosophie* 115-140; repr. in R. Bertholet, *Evolutionisme et platonisme*, Paris: Alcan, 1908.(Defends Hegel against the accusation of absolute determinism, integral optimism and panlogicism, and discusses Hegel's influence on Marx.)

Cousin, V. (1828-9) *Cours de l'histoire de la philosophie (Lecture on the History of Philosophy)*, Paris: Pichon & Didier, 3 vols.(The text of Cousin's lectures given in the academic year 1828-9, which drew heavily on Hegelian ideas.)

Derrida, J. (1967) 'De l'économie restreinte à l'économie générale: un hégélianisme sans réserve' (From Restricted to General Economy: A Hegelianism Without Reserve), in *L'Écriture et la différance*, Paris: Éditions du Seuil; trans. A. Bass, *Writing and Difference*, London: Routledge, 1978, 251-77.(Examines Georges Bataille's response to Kojève's reading of Hegel.)

Derrida, J. (1972) 'Le puits et la pyramide: Introduction à la sémiologie de Hegel' (The Pit and the Pyramid: Introduction to Hegel's Semiology), in *Marges de la philosophie*, Paris: Minuit, 79-127; trans. A. Bass, *Margins of Philosophy*, Brighton: Harvester, 1982.(Discusses Hegel's theory of signs.)

Derrida, J. (1974) *Glas*, Paris: Éditions Galilée; trans. J.P. Leavey, Jr and R. Rand, *Glas*, Lincoln, NB: University of Nebraska Press, 1986.(Complex and ambitious reading of various Hegel texts.)

Herr, L. (1894) 'Hegel', *La Grande Encyclopédie* 19: 997-1003; repr. in L. Herr, *Choix d'Écrits*, Paris: Les Éditions Ridier, 1932, vol. 2, 109-40.(Contains a lengthy summary of the Hegelian system, which revived interest in his philosophy in this period.)

Hyppolite, J. (1946) *Genèse et structure de la Phénoménologie de l'esprit de Hegel*, Paris: Aubier, 2 vols; trans. S. Cherniak and J. Heckman, *Genesis and Structure of Hegel's Phenomenology of Spirit*, Evanston, IL: Northwestern University Press, 1974. (Hyppolite's magisterial and influential commentary.)

Hyppolite, J. (1948) *Introduction à la philosophie de l'histoire de Hegel (Introduction to Hegel's Philosophy of History)*, Paris: Rivère; Paris: Editions du Seuil, 1983.(A collection of short studies stressing the relation between the early and later Hegel.)

Hyppolite, J. (1953) *Logique et existence, essai sur la Logique de Hegel (Logic and Existence: Essays on Hegel's Logic)*, Paris: Presses Universitaires de France. (Explores the contested issue of the relation of Hegel's *Logic* to the 'existential' dimension of the *Phenomenology*.)

Hyppolite, J. (1955) *Études sur Marx et Hegel*, Paris: Rivière; trans. J.O. Neill, *Studies on Marx and Hegel*, London: Heinemann, 1969.(Stresses the place of Hegelian themes in Marx's early writings.)

Hyppolite, J. (1971) *Figures de la Pensée Philosophiques*, Paris: Presses Universitaires de France, 2 vols. (Contains all of Hyppolite's articles on Hegel.)

Kojève, A. (1946) 'Hegel, Marx et le christianisme', *Critique* 1: 339-66; trans. H. Gildin, 'Hegel, Marx and Christianity', *Interpretation* (1970) 1: 21-42; repr. in Stern (ed.), vol. 2: 359-82.(Argues for what he describes as an atheistic reading of Hegel.)

Kojève, A. (1947) *Introduction à la lecture de Hegel*, Paris: Gallimard; partially trans. J.H.Nichols in A. Bloom (ed.) *Introduction to the Reading of Hegel*, Ithaca, NY, and London: Cornell University Press, 1969.(Text of Kojève's influential lectures at l'École des Hautes-Études from 1933 to 1939.)

Koyré, A. (1970) *Etudes d'histoire de la pensée philosophique (Historical Studies of Philosophical Thought)*, Paris: Gallimard.(Contains the three most important essays by Koyré on Hegel: 'Note sur la langue et la terminologie hégélienne' ('Note on Hegelian Language and Terminology') (1931) 'Rapport sur l'état des études hégéliennes en France' ('Report on the State of Hegelian Studies in France') (1931) and 'Hegel à Iéna' ('Hegel in Jena') (1934).)

Levinas, E. (1961) *Totalité et Infini*, The Hague: Martinus Nijhoff; trans. A. Lingis, *Totality and Infinity*, The Hague: Martinus Nijhoff, 1969.(An ethical critique of the alleged totalizing ambitions of the metaphysical tradition in general and Hegel in particular.)

Merleau-Ponty, M. (1946) 'L'existentialisme chez Hegel' (Existentialism in Hegel), *Les Temps modernes* 1: 1311-19; repr. in M. Merleau-Ponty, *Sens et non-sens*, Paris: Nagel, 1948; trans. H.L. Dreyfus and P.A. Dreyfus, *Sense and Non-Sense*, Evanston, IL: Northwestern University Press, 1964, 63-70.(Discusses the existentialist themes in Hegel's thought.)

Nöel, G. (1897) *La Logique de Hegel (Hegel's Logic)*, Paris: Alcan; repr. Paris: Vrin, 1933, 1938 and 1967.(A careful and sympathetic analysis of Hegel's *Logic*, which first appeared in instalments in the *Revue de métaphysique et de morale* from 1894 to 1896.)

Renan, E. (1876) *Dialogues et fragments philosophiques (Dialogues and Philosophical Fragments)*, Paris: Calman Lévy.(Written between 1860 and 1871, Renan here attempts to combine Comtean positivism with religion, via an evolutionary reading of Hegel.)

Scherer, E. (1861) 'Hegel et l'hégélianisme' (Hegel and Hegelianism), *Revue des deux mondes* 31: 812-56.(Gives a reasonably sympathetic overview of the attitude to Hegel in this period.)

Sartre, J-P. (1943) *L'Être et le néant*, Paris: Gallimard; trans. H.E. Barnes, *Being and Nothingness*, London: Methuen, 1958.(Follows Kojève's reading of the master-slave dialectic in his account of being-for-others.)

Taine, H.-A. (1857) *Les Philosophes français du XIXe siècle (Nineteenth-Century French Philosophy)*, Paris: Hachette; 3rd edn, 1868, under the title *Les Philosophes classiques du XIXe siècle en France*, Paris: Hachette. (Clearly expresses Taine's admiration for Hegel.)

Vera, A. (1855) *Introduction à la philosophie de Hegel (Introduction to Hegel's Philosophy)*, Paris: A. Franck.(A popular introduction to Hegel's thought.)

Vera, A. (1864) *Essais de philosophie hégélienne (Essays on Hegelian Philosophy)*, Paris: G. Ballère.(The three essays are 'La peine de mort', 'Amour et philosophie', and 'Introduction à la philosophie d'histoire'.)

Wahl, J. (1929) *Le Malheur de la conscience dans la philosophie de Hegel (The Unhappy Consciousness in the Hegel's Philosophy)*, Paris: Rieder, 2nd edn, 1951; repr. New York and London: Garland, 1984; 119-147 trans. R. Northey in Stern (ed.) (1993) vol. 2: 284-310.(An influential study, which treats Hegel's notion of the Unhappy Consciousness as a key to the reading of his work.)

Wahl, J. (1938) *Études kierkegaardiennes (Kierkegaardian Studies)*, Paris: Éditions Montaigne; 2nd edn, Paris: Vrin, 1949, 159-171.(A collection of articles, including 'Hegel et Kierkegaard' and 'La lutte contre l'hégélianisme'.)

Weil, E. (1950a) *Logique de la philosophie (Logic of Philosophy)*. Paris: Vrin.(A major systematic appropriation of Hegel's thought as a comprehensive theory of categories.)

Weil, E. (1950b) *Hegel et l'état (Hegel and the State)* Paris: Vrin.(An important defence of Hegel's political thought against accusations of conservatism.)

4 Northern Europe

Heiberg, J.L. (1824) *Om den menneskelige Frihed (On Human Freedom)*, Kiel: Universitets Boghandlingen.(An early contribution by one of Hegel's students to the theory of the will.)

Kierkegaard, S.A. (1846) *Afsluttende uvidenskabelig Efterskrift*, in A.B. Drachmann, J.L. Heiberg and H.O. Lange (eds) *Samlede Vaerker*, Copenhagen: Gyldendalske Boghandel, 1962-4, vol. 7 of 20; trans. D.F. Swenson and W. Lowrie, *Concluding Unscientific Postscript*, Princeton, NJ: Princeton University Press, 1941. (Contains Kierkegaard's most developed critique of Hegel and Hegelianism.)

Martensen, H.L. (1850) *Den Christlige Dogmatik*, trans. W. Urwick *Christian Dogmatics*, Edinburgh: T. & T. Clark, 1866.(Martensen's major work.)

Nielsen, R. (1864-6) *Grundidéernes Logik (The Logic of Fundamental Ideas)*, Copenhagen.(An application of Hegel's Logic.)

5 Italy

Croce, B. (1907) *Ciò che è vivo e ciò cheè morto nella filosofia di Hegel*, Bari: Laterza; repr. in *Saggio Sullo Hegel*, Bari: Laterza, 1913; trans. D. Ainslie, *What is Living and What is Dead of the Philosophy of Hegel*, London: Macmillan, 1915.(Croce's influential critical study. *Saggio Sullo Hegel* also contains other studies in Hegel and German philosophy.)

Croce, B. (1902) *Estetica*, Bari: Laterza, 4th edn, 1912; Part 1 trans. C. Lyas, *The Aesthetic as the Science of Pure Expression of the Linguistic in General*, Cambridge: Cambridge University Press, 1992.(Draws on the German Idealist tradition, but emphasizes the formal autonomy of the art work.)

Croce, B. (1938) *Storia come pensiero e azione*, Bari: Laterza, 2nd edn; trans. S. Sprigge, *History as the Story of Liberty*, London: Allen & Unwin, 1941.(A liberal version of humanist historicism which de-theologizes the Hegelian idea of history, treating it as the progress of the consciousness of freedom.)

Gentile, G. (1913) *La riforma della dialettica Hegeliana e B. Spaventa*, Messina: Giuseppe Principato; 2nd edn, 1923; Part 1 trans. A.M. Armstrong, 'The Reform of Hegelian Dialectic', *Idealistic Studies* (1981) 11: 187-213. (Gentile's attempt at a critical reconstruction of Hegel's dialectical method as a 'method of immanence'.)

Sanctis, F. de (1870-1) *La storia della letteraria italiana*, Naples: Domenico & Antonio Morano, 2 vols; trans. J. Redfern, *History of Italian Literature*, London: Oxford University Press, 2 vols, 1932.(Important document in the influence of Hegel's ideas in Italy, strongly influenced by Hegel's approach to aesthetics.)

Spaventa, B. (1869) *Studi sull'etica hegeliana (Studies in Hegelian Ethics), Proceedings of the Royal Academy of Moral and Political Sciences of Naples*, vol. 4; repr. in *Opere*, ed. G. Gentile, Florence: Sansoni, 1972, vol. 1, 611-801.(An important and influential early study.)

6 America

Dewey, J. (1884) 'Kant and Philosophic Method', *Journal of Speculative Philosophy* 18: 162-74; repr. in Stern (ed.) (1993) vol. 2, 151-61.(Presents a reading of Kant from a Hegelian perspective.)

Dewey, J. (1930) 'From Absolutism to Experimentalism', in G.P. Adams and W.P. Montague (eds) *Contemporary American Philosophy*, New York, 1930, vol. 2, 13-27; repr. in R.J. Bernstein (ed.) *John Dewey, On Experience, Nature and Freedom*, New York: The Liberal Arts Press, 1960.(An autobiographical essay, in which Dewey expresses his attraction towards Hegelianism when a young man.)

Goetzmann, W. (ed.) (1973) *The American Hegelians: An Intellectual Episode in the History of Western America*, New York: Alfred A. Knopf.(Contains excerpts from the major works of main nineteenth-century American Hegelians, including Brokmeyer, Harris and Stallo.)

Harris, W.T. (1890) *Hegel's Logic, A Book on the Genesis of the Categories of the Mind: A Critical Exposition*, Chicago, IL: S.C. Griggs; New York: Kraus Reprint Co., 1970.(The major work on Hegel by one of the most significant nineteenth-century Hegelians.)

James, W. (1882) 'On Some Hegelisms', *Mind* old series 7: 186-208.(An exuberant attack on Hegel's metaphysics and method, as interpreted by James.)

James, W. (1909) *A Pluralistic Universe*, London: Longman, Green.(Contains James's most sustained critique of Hegel's thought.)

Peirce, C.S. (1868) 'Nominalism versus Realism' and 'What is meant by determined', *Journal of Speculative Philosophy* 2: 57-61, 190-1; repr. in Stern (ed.) (1993) vol. 2: 140-50.(A critical exchange on Hegel with W.T. Harris.)

Peirce, C.S. (1903) *Lectures on Pragmatism*, in C. Hartshorne, P. Weiss and A.W. Burcks (ed.) *Collected Papers of Charles Sanders Peirce*, Cambridge, MA: Belknap Press, vol. 5 of 8, 1-131.(Peirce discusses his relation to Hegel in Lecture 1.)

Royce, J. (1892) *Spirit of Modern Philosophy*, Boston, MA, and New York: Houghton Mifflin. (Contains a vivid and sympathetic account of Hegel's position.)

Royce, J. (1919) *Lectures on Modern Idealism*, ed J. Loewenberg, New Haven, CT: Yale University Press.(Text of Royce's lectures of 1906.)

7 Britain

Bosanquet, B. (1888) *Logic, or the Morphology of Knowledge*, Oxford: Clarendon Press.(Bosanquet's main account of his idealist logic and metaphysics, with clear affinities to Hegel.)

Bosanquet, B. (1899) *The Philosophical Theory of the State*, London and New York: Macmillan; 4th edn, 1923. (Presents Bosanquet's broadly Hegelian account of the State and its relation to the individual.)

Bosanquet, B. (1892) *A History of Aesthetics*, London: Macmillan; 2nd edn, 1904.(Contains chapter on Hegel.)

Bradley, F.H. (1876) *Ethical Studies*, Oxford: Clarendon Press; 2nd edn, 1927.(Shows the impact of Hegel's critique of Kant on Bradley's ethical thinking.)

Bradley, F.H. (1883) *Principles of Logic*, Oxford: Clarendon Press; 2nd edn, 1922.(Reveals Bradley's equivocal relation to Hegel's idealistic logic.)

Bradley, F.H. (1893) *Appearance and Reality*, Oxford: Clarendon Press; 2nd edn, 1897; ninth impression, corrected, 1930.(Bradley's main work, which in some respects has affinities to Hegel's metaphysics.)

Caird, E. (1883) *Hegel*, Edinburgh and London: Blackwood.(A short but well-respected study.)

Caird, E. (1892) *Essays on Literature and Philosophy*, Glasgow: James Maclehose, 2 vols. (Contains several essays with comments on Hegel, informed throughout by Hegelian ideas.)

Collingwood, R.G. (1924) *Speculum Mentis*, Oxford: Clarendon Press.(An attempt to write a phenomenology of forms of experience, influenced by the Italian neo-Hegelians.)

Collingwood, R.G. (1945) *The Idea of Nature*, Oxford: Clarendon Press.(Contains an unusually sympathetic account of Hegel's philosophy of nature.)

Collingwood, R.G. (1946) *The Idea of History*, Oxford: Clarendon Press; revised edn, ed. J. van Dussen, Oxford:

Clarendon Press, 1993.(Contains a sympathetic discussion of Hegel's philosophy of history.)
McTaggart, J.M.E. (1896) *Studies in the Hegelian Dialectic*, Cambridge: Cambridge University Press; 2nd edn, 1922.(A detailed and sympathetic study of Hegel's dialectical method and its place in his metaphysics.)
McTaggart, J.M.E. (1901) *Studies in Hegelian Cosmology*, Cambridge: Cambridge University Press; 2nd edn, 1918.(Contains a discussion of a range of issues, mostly concentrating on Hegel's metaphysics, ethics, political philosophy and philosophy of religion.)
McTaggart, J.M.E. (1910) *A Commentary on Hegel's Logic*, Cambridge: Cambridge University Press.(A detailed commentary.)
Ritchie, D.G. (1890-1) 'Darwin and Hegel', *Proceedings of the Aristotelian Society* 1: 55-74; repr. in Stern (ed.) (1993) vol. 2: 41-59.(Attempts to defend Hegel against Seth's critique.)
Seth, A. (1887) *Hegelianism and Personality*, London: Blackwood.(Contains Seth's most developed and influential critique of Hegel.)
Stirling, J.H. (1865) *The Secret of Hegel*, London: Longman, Roberts & Green, 2 vols; 2nd edn, Edinburgh: Oliver & Boyd, 1898; repr. Bristol: Thoemmes, 1990.(The first major study on Hegel to appear in Britain.)
Wallace, W. (1874) *Prolegomena to the Study of Hegel's Philosophy*, Oxford: Oxford University Press. (Wide-ranging, sympathetic essays, trying to illuminate the background and content of Hegel's Logic.)

Secondary literature

Bellamy, R. (1987) *Modern Italian Social Theory*, Cambridge: Polity Press.(Contains chapters on Labriola, Croce, Gentile and Gramsci, and traces the roots of their thought back to the native idealist tradition.)
Bowie, A. (1993) *Schelling and Modern European Philosophy*, London: Routledge. (Chapter 6 provides a clear account of Schelling's critique of Hegel.)

Hegelianism, Russian

In Russian intellectual history the so-called 'remarkable decade' of 1838-48 (P.V. Annenkov's expression) could be characterized as a truly 'philosophical epoch'. Speculative philosophy was seen by then as directly relevant to all important questions of national existence. A similar situation obtained then, in exactly the same years, in the lands of partitioned Poland. In both countries all philosophical discussions revolved around Hegel, whose system was perceived as the culminating point in the development of Western philosophy. In Russia the fascination with Hegelianism was widespread and profound, reaching distant provincial centres and leaving its mark on literature. 'Philosophical notions', wrote Ivan Kireevskii in 1845, 'have become quite commonplace here now. There is scarcely a person who does not use philosophical terminology, nor any young man who is not steeped in reflections on Hegel'. Herzen provides an identical testimony. Hegel's works, he wrote,

> *were discussed incessantly; there was not a paragraph in the three parts of the Logic, in the two of the Aesthetics, the Encyclopaedia and so on, which had not been the subject of desperate disputes for several nights together. People who loved each other avoided each other for weeks at a time because they disagreed about the definition of 'all-embracing spirit', or had taken as a personal insult an opinion on the 'absolute personality and its existence in itself'.*
>
> *(Herzen [1853] 1968: 398)*

This vivid reception of Hegelianism was a socially important phenomenon, meeting several deep-seated psychological demands of the young Russian intelligentsia. First, as in Germany, speculative idealism provided the intelligentsia with a sort of compensation for the paralysis of public life under authoritarian government. Second, Hegelian philosophy was welcomed as an antidote to introspective day-dreaming and attitudes of Romantic revolt; in this context Hegelianism was largely interpreted as a philosophy of 'reconciliation with reality'. Somewhat later this conservative interpretation of Hegelianism was replaced by a Left-Hegelian philosophy of rational and conscious action; at this stage Hegelianism came to be a powerful instrument in the struggle against Slavophile conservative Romanticism. Both as a philosophy of reconciliation and as a philosophy of action Russian Hegelianism was above all a philosophy of reintegration; a philosophy which helped young intellectuals in overcoming their feeling of alienation and in building bridges between their ideals and reality.

1 From reconciliation with reality to philosophy of action

In the 1830s the chief centre of Russian Hegelianism was the Moscow circle of Nikolai Stankevich (1813-40). It counted among its members the literary critic Vissarion Belinskii, the future anarchist Mikhail Bakunin, the liberal historian Timofei Granovskii and even the future Slavophile Konstantin Aksakov; closely associated with the circle was the great Russian writer Ivan Turgenev.

Stankevich's intellectual evolution was a development from Schellingian pantheistic Romanticism (see Schellingianism), combined with Schiller's militant 'subjectivism', to Hegelianism, interpreted initially as a philosophy of reconciliation. In the last year of his life he was greatly impressed by August Cieszkowski's *Die Prolegomena zur Historiosophie (Prolegomena to the Wisdom of History)* (Berlin, 1838) and tried to link Cieszkowski's idea of the 'translation of philosophy into action' (see Cieszkowski, A.) with the Feuerbachian rehabilitation of feelings and senses (see Feuerbach, L.). A similar pattern can be discerned in the intellectual evolution of Bakunin and Belinskii.

After Stankevich left Russia to study philosophy in Berlin (in 1837), the leadership in his circle was taken over by Mikhail Bakunin. His conversion to Hegelianism took place in 1838 and was heavily influenced by the mystical ideas of the German Romantics (see Romanticism, German). In his 'Gimnazicheskie rechi Gegelia. Predislovie perevodchika' (Foreword to Hegel's School Addresses) (1838) Bakunin proclaimed 'the reconciliation with reality in all respects and all spheres of life'. He meant by this a radical overcoming of the abstract intellect (*Verstand* - *rassudok*) whose separation from the historical reason (*Vernunft* - *razum*) had caused the terrible modern disease of subjective revolt, finding expression in Schiller, Fichte and the rebellious poetry of Byron. The most advanced stage of this disease was embodied, in his view, by France - a country mortally sick of a barren revolutionary negation.

In 1840 Bakunin, following Stankevich, went to Berlin - the ‘New Jerusalem’ of the Russian idealists - and very soon became an extreme Left Hegelian, an apostle of a radical, revolutionary ‘negation’ of the ’old world’. In his article in ’Die Reaktion in Deutschland’ (Reaction in Germany) (published under the pseudonym Jules Elysard in *Deutsche Jahrbücher für Wissenschaft und Kunst*) (1842) he elaborated a theoretical foundation for a revolutionary philosophy of action. It was one of the first serious attempts to make a radical ‘Left-wing’ interpretation of the Hegelian dialectic. In contrast to Hegel, Bakunin saw transcending (*Aufhebung*), in other words the final result of dialectic process, as a complete destruction of the past. The essence of contradiction, he argued, is not an equilibrium but ‘the preponderance of the negative’, whose role is decisive. Revolutionary negation includes within itself the totality of the contradiction and so alone has absolute legitimacy. The article ended with the words: ‘The joy of destruction is also a creative joy’. Shortly thereafter Bakunin cut himself off from speculative philosophy and began his ‘search for God’ in revolutionary praxis.

The story of Vissarion Belinskii’s involvement in Hegelianism was especially dramatic (see Belinskii, V.). Before his acquaintance with Hegel he was influenced by the activist idealism of Fichte, interpreted by him as a philosophy of heroic voluntarism. However, towards the end of 1837, he became struck by Hegel’s famous thesis: ‘What is real is rational, what is rational is real’. This led him to proclaim a philosophy of reconciliation, condemning all sorts of voluntaristic ’subjectivism’ in the name of objective and rational laws of history. Unlike Bakunin, Belinskii was far from mystical idealism; hence he interpreted reconciliation in an empirical way, forcing himself to glorify tsarist autocracy and to accept the stifling social realities of Nicolaevan Russia. But this sort of self-indoctrination did not help him to overcome the painful feelings of alienation. In March 1841 he revolted against Hegel’s historiosophical theodicy, vindicating the value of individual freedom and the heritage of the French Enlightenment. Initially it was a purely moral protest but very soon it became philosophically justified by a radical reinterpretation of the notion of ‘rational reality’, stressing the role of ‘dialectical negation’. In this way Belinskii rejected conservative historicism, setting against it the idea of free, autonomous individuality, non-reducible to a mere instrument of ’vast impersonal forces’ (Isaiah Berlin’s expression). At the end of his life he sympathized with the philosophy of Feuerbach, in which he recognized a form of anthropocentrism liberating the individual from the despotic power of ’the absolute spirit’ and rehabilitating the ‘natural side’ of human existence.

Unlike the members of Stankevich’s circle, Herzen was never tempted by the philosophy of reconciliation, seeing it as a form of moral suicide. In 1840 he embarked on a systematic study of Hegelianism with the aim of refuting its right-wing interpretation. He was helped in this endeavour by two Left-Hegelian thinkers: Cieszkowski (whose *Prolegomena* he read in 1838) and Feuerbach.

Herzen’s philosophical essays of the 1840s, especially ‘Buddizm v nauke’ (‘Buddhism in Science’) (1843) and ‘Pis’ma ob izuchenii nauki’ (‘Letters on the Study of Nature’) (1845), develop the themes of the ‘philosophy of action’ and ‘the rehabilitation of the natural’, as two approaches to the problem of personal identity and freedom. In ‘Buddizm v nauke’ Herzen set his philosophy of action against the contemplative ‘panlogism’ of Hegel. He wrote: ‘Action is the personality itself’. This meant that in order to become a personality man must get rid of his ‘natural immediacy’, raise himself to the ‘Buddhist’ realm of impersonal, abstract thought, get lost in the general and then (the third stage) regain his identity and express himself in free, conscious activity, changing the world in the desired direction. In ‘Pis’ma ob izuchenii nauki‘ the problem of personality was shown against the background of the historical development of philosophical attitudes towards Nature. Their leitmotif was the demand for a reconciliation between naturalistic empiricism (identified with materialism) and idealism, with a strong insistence that it was to be realized not only for the sake of science but above all for the benefit of the human personality. Following Feuerbach, Herzen saw idealism as representing ’The General‘, at the expense of ignoring and annihilating the individual. ’Materialism‘, on the other hand, threatened to reduce human beings to their natural, immediate particularism. The future synthesis of both outlooks, Herzen concluded, should vindicate the rights of concrete individuals of flesh and blood but without losing the achievements of idealism, which had raised humans to the level of universalism.

An important theme in Herzen’s critique of Hegel’s philosophy of history was his protest against treating individuals and nations as mere instruments of the Reason of History. Nevertheless, before he went to the West (in 1847) he retained his faith in progress and Hegelian belief in the basic rationality of the historical process as a whole. This belief, however, did not survive the defeat of socialism in the revolutions of 1848. In his book *S togo*

berega (From the Other Shore) (1850) Herzen definitely broke with Hegelianism, asserting that history was but a blind play of chances and refusing to make human sacrifices on the altar of illusionary progress.

2 Belinskii's aesthetics and literary criticism

As a literary critic Belinskii owed a great deal to the German Romantics while supporting the realist tendency in Russian literature. Hegelianism enabled him to overcome Romantic 'subjectivism' and to embrace instead the ideal of 'objective art'. In the period of 'reconciliation' he meant by this that writers should reflect objective reality in all its richness, putting aside their 'subjectivity' and refraining from value-judgments. The perfect embodiments of this ideal were for him the great 'Olympians', Goethe and Pushkin. The rejection of 'reconciliation' entailed a re-examination of this view - a rehabilitation of the artists' right to 'subjectivism'. At this stage, however, 'subjectivism' in art was no longer identified with Romantic whims; Belinskii stressed that legitimate subjectivism does not distort reality but reproduces it faithfully and judges it from the point of view of the forward-moving trend within society. In this way he justified and propagated the ideological commitment of realistic literature.

The influence of Hegel's aesthetics on Belinskii's thought is most visible in Belinskii's article 'The Idea of Art' (1841). It is very characteristic, however, that Belinskii corrected Hegel by placing art, defined as 'the immediate contemplation of truth', above religion, defined as an 'immediate representation of truth'. This correction reflected Belinskii's view that religious mythology was good only for the lowest, infantile stage of the human spirit, and that the development of literature was preparing society for the attainment of maturity in conscious, self-reflecting thought. In this way Belinskii justified his ardent belief in the emancipatory mission of Russian literature.

Belinskii emphasized that artistic generalization should not be confused with a 'logical syllogism' or 'schematic abstraction'. This would be transgressing against the very nature of art, since art was 'thinking in images'. But it was difficult to reconcile the autonomy of art with the conviction that artists, particularly writers, should serve the cause of historical progress. Hence a certain tension in Belinskii's views. In his series of articles on Pushkin (1843-6) he stated that poetry has no purpose beyond itself; in his other articles, however, he used to encourage the progressively minded writers by repeating that there is no such thing as pure art, since every work of art is tendentious. Thus, the legacy of Belinskii's literary criticism was somewhat ambivalent and subject to different interpretations.

3 The Westernizing philosophies of Russian history

Hegel's philosophy of history, as well as his philosophy of law, stressed the necessity and progressive function of the increasing rationalization of social bonds, which was directly relevant for the Russian controversy between Slavophiles and Westernizers. Hegelianism was incompatible with idealization of the Russian past and, for this reason alone, served the cause of Westernism.

The most consistent and prolific Westernizer of the 'remarkable decade' was Belinskii. His contribution consisted in applying to Russia the Hegelian conception of development from 'natural immediacy' to 'rational reality' and the Hegelian distinction between 'nonhistorical peoples' and 'historical nations'.

Pre-Petrine Russia, in Belinskii's view, was a nation in its natural, immediate and patriarchal state; hence it was not a nation in the modern sense of this term (*natsiia*) but only a people (*narod*), and its culture could not have any universal human significance. Only the reforms of Peter the Great raised Russia to the level of nationhood. The price for this was the radical negation of the natural immediacy of ancient Russia and the resulting cleavage between the Westernized 'society' and non-Westernized folk (*narod*). Owing to these reforms the Russian state could become an active subject of universal human history. However, in order to become a fully fledged 'historical nation' the Russians had to develop modern national consciousness and create a national literature of a truly world-historical significance. The decisive step in this direction was made by Pushkin. Thus, the Westernization of Russia laid foundations for its truly national development.

Another Hegelianizing interpretation of Russian history was provided by the young Moscow historian Konstantin Kavelin, a disciple of T.Granovskii. In his study 'Vzgliad na iuridicheskii byt v drevnei Rossii' ('A Brief Survey of Juridical Relations in Ancient Russia') (1847) he developed the argument that the Russian historical process consisted in the gradual dissolution of patriarchal bonds and their replacement by the juridical order of the centralized state, which made room for individual freedom. From this perspective Peter the Great appeared as the

first completely emancipated individual in Russian history. The historical process in Russia led, therefore, to the emancipation of the individual through the rationalization of social relations by means of law. According to Kavelin, the emergence of the centralized Muscovite state played an important part in this process. This view - which sprang from Kavelin’s interpretation of the Muscovite autocracy in terms of the rationalistic Hegelian state - was later to be developed by the ’etatist school’ of Russian historiography. Its representatives, including the Hegelian philosopher Boris Chicherin, argued that in Russia the state had always been the chief organizer of society and the main agent of progress (see Liberalism, Russian §2).

4 Hegelianism and Slavophilism

The leading Slavophile thinkers, Ivan Kireevskii and Aleksei Khomiakov, were definitely opposed to Hegelianism. They saw Hegelian philosophy as the culmination of the anti-ontological tendency in Western rationalism, which transformed living reality into a dialectic of incorporeal notions. They passionately rejected Hegel’s view that the meaning of universal history was the necessary process of the rationalization of society; according to them this was true of the West but did not apply to Russia. On theoretical grounds, against Hegelian dialectical historicism they set a conservative-Romantic historicism, enshrining uninterrupted historical continuity and condemning sudden breaks with the past as a betrayal of ’historicity’.

Nevertheless, two younger Slavophile thinkers - Konstantin Aksakov and Iurii Samarin - tried for some time to combine Slavophilism with Hegelianism, thus giving rise to a curious phenomenon known as ’Orthodox-Christian Hegelianism’ (Herzen’s expression). The main documents of this trend are two books written as master’s dissertations for the University of Moscow: Aksakov’s *Lomonosov in the History of Russian Language and Literature* (published 1846) and Samarin’s *Stepan Iavorskii and Theophan Prokopovich* (defended 1844). The first of them was an ingenious interpretation of the history of Russian language and literature as a process raising the particular to the universal and then overcoming abstract universality. The second developed the view that the lack of rational scholastic theology was in fact the great merit of Orthodox Christianity because, as Hegel had shown, religious truths should not be rationally defined and presented in the form of a quasi-scientific system.

However, Slavophile Hegelianism did not stand the test of time. The two Slavophile Hegelians soon realized that in fact Hegelian philosophy supported the standpoint of the Westernizers and that attempts to make it consonant with Slavophilism were futile and doomed to failure (see Slavophilism).

5 Russian Hegelianism in the second half of the nineteenth century

The ’philosophical epoch’ in Russia ended abruptly in 1848. The revolutionary events of the European Springtime of the Peoples pushed the tsarist government in the direction of the most severe repression of intellectual life. Philosophy, seen as a source of dangerous disease, was banished from universities and the new censorship rules made it impossible even to mention in print the names of Hegel, Feuerbach, or Belinskii. This gloomy period of repression ended only after Russia’s defeat in the Crimean War and the unexpected death of Nicholas I. The first symptom of the forthcoming political ’thaw’ was the public defence of Chernyshevskii’s master’s dissertation ‘Ėsteticheskie otnosheniia iskusstva k deistvitelnosti’ (The Aesthetic Relations Between Art and Reality), in the University of St Petersburg in May 1855 (see Chernyshevskii, N.G.).

The content of Chernyshevskii’s thesis was directly linked with the philosophical discussions of the ’remarkable decade’. Without mentioning the prohibited names, Chernyshevskii discussed in it Hegelian idealism, Feuerbachian anthropological materialism and Belinskii’s views on art: he accused Hegel of establishing ’the tyranny of the universal’, praised Feuerbach for rehabilitating nature and developed Belinskii’s view in a consistently utilitarian direction, stressing especially the didactic function of literature. His utilitarian approach to art, further radicalized by Nikolai Dobroliubov and Dmitrii Pisarev, aroused indignation among the so-called Aesthetic Critics (V. Botkin, P. Annenkov and A. Druzhinin) and caused them to defend Hegelian aesthetics, philosophical idealism in general, and the legacy of the Russian intellectuals of the 1840s. Owing to this Hegelianism came to be associated with the liberal aestheticism, characteristic of the older generation and opposed by the young radicals, who chose to be seen as intransigent enemies of all idealism and aesthetics. This conflict between the two generation of Russian intellectuals is shown in Turgenev’s novel *Fathers and Sons*.

In contrast to the younger radicals, Chernyshevskii himself did not see Hegel’s philosophy as entirely obsolete and

worthless. He made a distinction between Hegel's system and Hegel's dialectical method, rejecting the first but trying to save the second through giving it a naturalistic interpretation. For this reason Soviet philosophers treated him as a precursor of dialectical materialism (see Russian Materialism: 'the 1860s' §3).

Philosophical naturalism and positivistic scientism, which dominated Russian intellectual life after the 1860s, were, of course, deeply inimical to Hegelian idealism. Nevertheless, the Hegelian tradition survived in Russia, although in a marginalized and defensive form. Thus, for instance, Pavel Bakunin, brother of Mikhail Bakunin, elaborated a religious, Romantic interpretation of Hegelianism and presented it in his two books: *Zapozdalyi golos sorokovykh godov (A Belated Voice of the Forties)* (1881) and *Osnovy very i znzniia (Foundations of Faith and Knowledge)* (1886). Another religious reinterpretation of Hegelianism was offered by Nikolai Debolskii, professor at the St Petersburg Theological Academy, whose *Filosofiia fenomenal'nogo formalizma (Philosophy of Phenomenalistic Formalism)* (2 vols, 1892-5) tried to reconcile Hegelian rationalism with traditional Christian theism.

The greatest representative of the Hegelian tradition in the second half of the century was Chicherin, who also tried to reconcile philosophy and religion by identifying universal Reason with a personal God. In his political philosophy he combined Hegelian emphasis on the need of a strong state with conservative liberalism, making use of the Hegelian concept of civil society as a sphere of civil liberties (as distinct from political freedom) and free play of particularistic economic interests. Evgenii Trubetskoi, author of the classical monograph on Vladimir Solov'ëv saw Chicherin as the living bridge between the 'philosophical epoch' of 1838-48 and the Religious-Philosophical Renaissance of the twentieth century.

The legacy of the Russian Hegelians of the 1840s, especially the legacy of Belinskii, was claimed also by a thinker representing the opposite pole of the ideological spectrum: Georgii Plekhanov, 'father of Russian Marxism'. He was greatly impressed by Hegelian dialectical historicism, particularly the concept of rational historical necessity, seeing in it an effective antidote to populist 'subjective sociology' and all sorts of social utopianism. Due to his efforts interest in Hegelian dialectics, in a materialistic interpretation, became a characteristic feature of Russian and Soviet Marxism.

Heidegger, Martin (1889-1976)

Martin Heidegger taught philosophy at Freiburg University (1915-23), Marburg University (1923-8), and again at Freiburg University (1928-45). Early in his career he came under the influence of Edmund Husserl, but he soon broke away to fashion his own philosophy. His most famous work, Sein und Zeit (Being and Time)was published in 1927. Heidegger's energetic support for Hitler in 1933-4 earned him a suspension from teaching from 1945 to 1950. In retirement he published numerous works, including the first volumes of his Collected Edition. His thought has had strong influence on trends in philosophy ranging from existentialism through hermeneutics to deconstruction, as well as on the fields of literary theory and theology.

Heidegger often makes his case in charged and dramatic language that is difficult to convey in summary form. He argues that mortality is our defining moment, that we are thrown into limited worlds of sense shaped by our being-towards-death, and that finite meaning is all the reality we get. He claims that most of us have forgotten the radical finitude of ourselves and the world we live in. The result is the planetary desert called nihilism, with its promise that an ideally omniscient and virtually omnipotent humanity can remake the world in its own image and likeness. None the less, he still holds out the hope of recovering our true human nature, but only at the price of accepting a nothingness darker than the nihilism that now ravishes the globe. To the barely whispered admission, 'I hardly know anymore who and where I am', Heidegger answers: 'None of us knows that, as soon as we stop fooling ourselves' ([1959a] 1966: 62).

Yet he claims to be no pessimist. He merely wants to find out what being as such means, and Being and Time was an attempt at this. He called it a fundamental ontology: a systematic investigation of human being (Dasein) for the purpose of establishing the meaning of being in general. Only half of the book - the part dealing with the finitude and temporality of human being - was published in 1927. Heidegger elaborated the rest of the project in a less systematic form during the decades that followed.

Heidegger distinguishes between an entity (anything that is) and the being of an entity. He calls this distinction the 'ontological difference'. The being of an entity is the meaningful presence of that entity within the range of human experience. Being has to do with the 'is': what an entity is, how it is, and the fact that it is at all. The human entity is distinguished by its awareness of the being of entities, including the being of itself. Heidegger names the human entity 'Dasein' and argues that Dasein's own being is intrinsically temporal, not in the usual chronological sense but in a unique existential sense: Dasein ek-sists (stands-out) towards its future. This ek-sistential temporality refers to the fact that Dasein is always and necessarily becoming itself and ultimately becoming its own death. When used of Dasein, the word 'temporality' indicates not chronological succession but Dasein's finite and mortal becoming.

If Dasein's being is thoroughly temporal, then all of human awareness is conditioned by this temporality, including one's understanding of being. For Dasein, being is always known temporally and indeed is *temporal. The meaning of being is time. The two main theses of Being and Time - that Dasein is temporal and that the meaning of being is time - may be interpreted thus: being is disclosed only finitely within Dasein's radically finite awareness.*

Heidegger arrives at these conclusions through a phenomenological analysis of Dasein as being-in-the-world, that is, as disclosive of being within contexts of significance. He argues that Dasein opens up the arena of significance by anticipating its own death. But this event of disclosure, he says, remains concealed even as it opens the horizon of meaning and lets entities be understood in their being. Disclosure is always finite: we understand entities in their being not fully and immediately but only partially and discursively; we know things not in their eternal essence but only in the meaning they have in a given situation. Finite disclosure - how it comes about, the structure it has, and what it makes possible - is the central topic of Heidegger's thought. 'Time is the meaning of being' was only a provisional way of expressing it.

Dasein tends to overlook the concealed dimension of disclosure and to focus instead on what gets revealed: entities in their being. This overlooking is what Heidegger calls the forgetfulness of the disclosure of being. By that he means the forgetting of the ineluctable hiddenness of the process whereby the being of entities is disclosed. He argues that this forgetfulness characterizes not only everyday 'fallen' human existence but also the entire

history of being, that is, metaphysics from Plato to Nietzsche. He calls for Dasein resolutely to reappropriate its own radical finitude and the finitude of disclosure, and thus to become authentically itself.

1 Life and works

Martin Heidegger was born on 26 September 1889 in Messkirch, Southwest Germany, to Roman Catholic parents of very modest means. From 1899 to 1911 he intended to become a priest, but after two years of theological studies at Freiburg University a recurring heart condition ended those hopes. In 1911 he switched to mathematics and the natural sciences, but finally took his doctorate in philosophy (1913) with a dissertation entitled *Die Lehre vom Urteil im Psychologismus (The Doctrine of Judgment in Psychologism)* (1914). Hoping to get appointed to Freiburg's chair in Catholic philosophy, he wrote a qualifying dissertation in 1915 on a theme in medieval philosophy, *Die Kategorien- und Bedeutungslehre des Duns Scotus (Duns Scotus' Doctrine of Categories and Meaning)* (1916). However, the job went to someone else, and in the autumn of 1915 Heidegger began his teaching career at Freiburg as a lecturer.

At this time Heidegger was known as a Thomist, but his 1915 dissertation was strongly influenced by the founder of phenomenology, Edmund Husserl. When Husserl joined the Freiburg faculty in the spring of 1916, Heidegger came to know him personally, if not well. Their relation would blossom only after the First World War. Heidegger was drafted in 1918 and served as a weatherman on the Ardennes front in the last three months of the war. When he returned to Freiburg his philosophical career took a decisive turn. In a matter of weeks he announced his break with Catholic philosophy (9 January 1919), got himself appointed Husserl's assistant (21 January), and began lecturing on a radical new approach to philosophy (4 February).

Many influences came to bear on Heidegger's early development, including St Paul, Augustine, Meister Eckhart, Kierkegaard, Dilthey and Nietzsche. But the major influences were Husserl and Aristotle. Heidegger was Husserl's protégé in the 1920s, but he never was a faithful disciple. He preferred Husserl's early work, *Logische Untersuchungen (Logical Investigations)* (1900-1), to the exclusion of the master's later developments. Moreover, the things that Heidegger liked about *Logical Investigations* were generally consonant with the traditional scholastic philosophy he had been taught.

First, Husserl's early phenomenology considered the human 'psyche' not as a substantial thing but as an act of revealing (intentionality), one that revealed not only *what* is encountered (the entity) but also the *way in which* it is encountered (the entity's being). Second, the early Husserl held that the central issue of philosophy was not modern subjectivity but rather 'the things themselves', whatever they might happen to be, in their very appearance; and he provided a descriptive method for letting those things show themselves as they are. Third, phenomenology argued that the being of entities is known not by some after-the-fact reflection or transcendental construction but directly and immediately by way of a categorial intuition. In short, for Heidegger, phenomenology was a descriptive method for understanding the being of entities as it is disclosed in intentional acts (see Phenomenological movement).

As Heidegger took it, all this contrasted with Husserl's later commitment to pure consciousness as the presuppositionless 'thing itself' that was to be revealed by various methodological 'reductions'. Heidegger had no use either for the Neo-Kantian turn to transcendental consciousness that found expression in Husserl's *Ideen (Ideas)* (1913) or for his further turn to a form of Cartesianism. Against Husserl's later theory of an unworldly transcendental ego presuppositionlessly conferring meaning on its objects, Heidegger proposed the historical and temporal situatedness of the existential self, 'thrown' into the world, 'fallen' in among entities in their everyday meanings, and 'projecting' ahead towards death.

In the 1920s Heidegger began interpreting the treatises of Aristotle as an implicit phenomenology of everyday life without the obscuring intervention of subjectivity. He took Aristotle's main topic to be 'disclosure' (*alētheia*) on three levels: entities as intrinsically self-disclosive; human *psyche* as co-disclosive of those entities; and especially the human disclosure of entities in discursive, synthetic activity (*logos*), whether that be performed in wordless actions or in articulated sentences. Going beyond Aristotle, Heidegger interpreted this discursive disclosure as grounded in a kind of movement that he named 'temporality', and he argued that this temporality was the very essence of human being.

Using this new understanding of human being, Heidegger reinterpreted how anything at all appears to human

beings. He argued that humans, as intrinsically temporal, have only a temporal understanding of whatever entities they know. But humans understand an entity by knowing it in its being, that is, in terms of how it happens to be present. Therefore, as far as human being goes, all forms of being are known temporally and indeed *are* temporal. The meaning of being is time.

Heidegger developed this thesis gradually, achieving a provisional formulation in *Sein und Zeit (Being and Time)* (1927). In public he dedicated the book to Husserl 'in respect and friendship', but in private he was calling Husserl's philosophy a 'sham' (*Scheinphilosophie*). Meanwhile, in 1923 an unsuspecting Husserl helped Heidegger move from a lecturer's job at Freiburg to a professorship at Marburg University; and when Husserl retired in 1928, he arranged for Heidegger to succeed him in the chair of philosophy at Freiburg. Once Heidegger had settled into the new job, the relationship between mentor and protégé quickly fell apart. If *Being and Time* were not enough, the three works Heidegger published in 1929 - 'Vom Wesen des Grundes' ('On the Essence of Ground'), *Kant und das Problem der Metaphysik (Kant and the Problem of Metaphysics)*, and *Was ist Metaphysik? (What is Metaphysics?)* - confirmed how far apart the two philosophers had grown.

Heidegger's career entered a new phase when the Nazis came to power in Germany. On 30 January 1933 Adolf Hitler was appointed Chancellor, and within a month the German constitution and all-important civil rights were suspended. On 23 March Hitler became dictator of Germany, with absolute power to enact laws, and two weeks later, harsh anti-Semitic measures were promulgated. A conservative nationalist and staunch anti-Communist, Heidegger supported Hitler's policies with great enthusiasm for at least one year, and with quieter conviction for some ten years thereafter. He was elected rector (president) of Freiburg University on 21 April 1933 and joined the Nazi Party on May 1, with the motive, he later claimed, of preventing the politicization of the university. In his inaugural address as rector, *Die Selbstbehauptung der deutschen Universität (The Self-Assertion of the German University)* (27 May 1933), he called for a reorganization of the university along the lines of some aspects of the Nazi revolution. As rector he proved a willing spokesman for, and tool of, Nazi policy both foreign and domestic.

Heidegger resigned the rectorate on 23 April 1934 but continued to support Hitler. His remarks in the classroom indicate that he backed the German war aims, as he knew them, until at least as late as the defeat at Stalingrad in January 1943. The relation, or lack of it, between Heidegger's philosophy and his political sympathies has long been the subject of heated debate.

Heidegger published relatively little during the Nazi period. Instead, he spent those years rethinking his philosophy and setting out the parameters it would have, both in form and focus, for the rest of his life. The revision of his thought is most apparent in three texts he published much later: (1) the working notes from 1936-8 that he gathered into *Beiträge zur Philosophie. Vom Ereignis (Contributions to Philosophy: On Ereignis)*, published posthumously in 1989; (2) the two volumes of his *Nietzsche*, published in 1961, which contains lecture courses and notes dating from 1936 to 1946; and (3) 'Brief über den Humanismus' ('Letter on Humanism'), written in the autumn of 1946 and published in 1947.

After the war Heidegger was suspended from teaching because of his Nazi activities in the 1930s. In 1950, however, he was allowed to resume teaching, and thereafter he occasionally lectured at Freiburg University and elsewhere. Between 1950 and his death he published numerous works, including the first volumes of his massive *Gesamtausgabe (Collected Edition)*. He died at his home in Zähringen, Freiburg, on 26 May 1976 and was buried in his home town of Messkirch. His literary remains are held at the German Literary Archives, at Marbach on the Neckar.

Heidegger, a Catholic, married Elfride Petri (1893-1992), a Lutheran, on 21 March 1917. They had two sons, both of whom served in the *Wehrmacht* during the Second World War and were taken prisoner on the Eastern Front. In February of 1925 Heidegger began a year-long affair with his then student, Hannah Arendt. In February of 1950 they resumed a strong but often stormy friendship that lasted until Arendt's death.

2 Temporality and authenticity

Heidegger was convinced that Western philosophy had misunderstood the nature of being in general and the nature of human being in particular. His life's work was dedicated to getting it right on both scores.

In his view, the two issues are inextricably linked. To be human is to disclose and understand the being of

whatever there is. Correspondingly, the being of an entity is the meaningful presence of that entity within the field of human experience. A proper or improper understanding of human being entails a proper or improper understanding of the being of everything else. In this context 'human being' means what Heidegger designates by his technical term 'Dasein': not consciousness or subjectivity or rationality, but that distinctive kind of entity (which we ourselves always are) whose being consists in disclosing the being both of itself and of other entities. The being of this entity is called 'existence' (see §4).

Heidegger argues that the structure of human being is comprised of three co-equal moments: becoming, alreadiness and presence. (These are usually, and unfortunately, translated as: 'coming towards itself', 'is as having been' and 'making-present'.) As a unity, these three moments constitute the essence of human being, which Heidegger calls 'temporality': opening an arena of meaningful presence by anticipating one's own death. Temporality means being present by becoming what one already is.

Becoming. To be human means that one is not a static entity just 'there' among other things. Rather, being human is always a process of becoming oneself, living into possibilities, into one's future. For Heidegger, such becoming is not optional but necessary. He expresses this claim in various co-equal formulas: (1) The essence of human being is 'existence' understood as 'ek-sistence', an ineluctable 'standing out' into concern about one's own being and into the need to become oneself; (2) the essence of human being is 'factical', always already thrust into concernful openness to itself and thus into the ineluctability of self-becoming; and (3) the essence of being human is 'to be possible' - not just able, but above all needing, to become oneself.

The ultimate possibility into which one lives is the possibility to end all possibilities: one's death. Human beings are essentially finite and necessarily mortal, and so one's becoming is an anticipation of death. Thus, to know oneself as becoming is to know oneself, at least implicitly, as mortal. Heidegger calls this mortal becoming 'being-unto-death'.

Alreadiness. Human being consists in becoming; and this becoming means becoming what one already is. Here the word 'already' means 'essentially', 'necessarily' or 'inevitably'. 'Alreadiness' (*Gewesenheit*) names one's inevitable human essence and specifically one's mortality. In becoming the finitude and mortality that one already is, one gets whatever presence one has.

Presence. Mortal becoming is the way human being (a) is meaningfully present to itself and (b) renders other entities meaningfully present to itself. To put the two together: things are present to human being in so far as human being is present to itself as mortal becoming. In both cases presence is bound up with absence.

How human being is present to itself. Since mortal becoming means becoming one's own death, human being appears as disappearing; it is present to itself as becoming absent. To capture this interplay of presence and absence, we call the essence of human being 'pres-abs-ence', that is, an incomplete presence that shades off into absence. Pres-abs-ence is a name for what classical philosophy called 'movement' in the broad sense: the momentary presence that something has on the basis of its stretch towards the absent.

Pres-abs-ence is an index of finitude. Any entity that appears as disappearing, or that has its current presence by anticipating a future state, has its being not as full self-presence but as finite pres-abs-ence. The movement towards death that defines human being is what Heidegger calls 'temporality'. The quotation marks indicate that 'temporality' does not refer to chronological succession but rather means having one's being as the movement of finite mortal becoming.

How other things are present to human being. Other entities are meaningfully present to human being in so far as human being is temporal, that is, always anticipating its own absence. Hence the meaningful presence of things is also temporal or pres-abs-ent - always partial, incomplete and entailing an absence of its own. Not only is human being temporal but the presence of things to human being is also temporal in its own right.

All of Heidegger's work argues for an intrinsic link between the temporality or pres-abs-ence that defines human being and the temporality or pres-abs-ence that characterizes the meaningful presence of things. But the meaningful presence of things is what Heidegger means by being. Therefore, Heidegger's central thesis is this: as far as human experience goes, all modes of being are temporal. The meaningful presence of things is always imperfect, incomplete, pres-abs-ential. The meaning of being is time.

Heidegger argues that this crucial state of affairs - finite human being as an awareness of the finitude of all modes of being - is overlooked and forgotten both in everyday experience and in philosophy itself. Therefore, his work discusses how one can recover this forgotten state of affairs on both of those levels.

As regards everyday life, Heidegger describes how one might recall this central but forgotten fact and make it one's own again. The act of reappropriating one's own essence - of achieving a personal and concrete grasp of oneself as finite - is called 'resolution' (in other translations, 'resoluteness' or 'resolve'). This personal conversion entails becoming clear about the intrinsic finitude of one's own being, and then choosing to accept and to be that finitude.

Awareness of one's finitude. Human being is always already the process of mortal becoming. However, one is usually so absorbed in the things one encounters ('fallenness') that one forgets the becoming that makes such encounters possible. It takes a peculiar kind of experience, more of a mood than a detached cognition, to wake one up to one's finitude. Heidegger argues that such an awakening comes about in special 'basic moods' (dread, boredom, wonder and so on) in which one experiences not things but that which is not-a-thing or 'no-thing'. Each of these basic moods reveals, in its own particular way, the absential dimension of one's pres-abs-ence.

Heidegger often uses charged metaphors to discuss this experience. For example, he describes dread as a 'call of conscience', where 'conscience' means not a moral faculty but the heretofore dormant, and now awakening, awareness of one's finite nature. What this call of conscience reveals is that one is 'guilty', not of some moral fault but of an ontological defect: the fact of being intrinsically incomplete and on the way to absence. The call of conscience is a call to understand and accept this 'guilt'.

Choosing one's finitude. One may choose either to heed or to ignore this call of conscience. To heed and accept it means to acknowledge oneself as a mortal process of pres-abs-ence and to live accordingly. In that case, one recuperates one's essence and thus attains 'authenticity' by becoming one's proper (or 'authentic') self. To ignore or refuse the call does not mean to cease being finite and mortal but rather to live according to an improper (inauthentic or 'fallen') self-understanding. Only the proper or authentic understanding of oneself as finite admits one to the concrete, experiential understanding that all forms of being, all ways that things can be meaningfully present, are themselves finite.

Summary. The essence of human being is temporality, that is, mortal becoming or pres-abs-ence. To overlook mortal becoming is to live an inauthentic temporality and to be a fallen self. But to acknowledge and choose one's mortal becoming in the act of resolution is to live an authentic temporality and selfhood. It means achieving presence (both the presence of oneself and that of other entities) by truly becoming what one already is. This recuperation of one's own finite being can lead to the understanding that what conditions *all* modes of being is finitude: the very meaning of being is time.

3 Being-in-the-world and hermeneutics

In *Being and Time* Heidegger spells out not only the reasons why, but also the ways in which, things are meaningfully present to human being.

Being-in-the-world. In contrast to theories of human being as a self-contained theoretical ego, Heidegger understands human being as always 'outside' any supposed immanence, absorbed in social intercourse, practical tasks and its own interests. Evidence for this absorption, he argues, is that human being always finds itself caught up in a mood - that is, 'tuned in' to a given set of concerns. The field of such concerns and interests Heidegger calls the 'world'; and the engagement with those needs and purposes and the things that might fulfil them he calls 'being-in-the-world' (or equally 'care').

Heidegger's term 'world' does not mean planet earth, or the vast expanse of space and time, or the sum total of things in existence. Rather, 'world' means a dynamic set of relations, ultimately ordered to human possibilities, which lends meaning or significance to the things that one deals with - as in the phrase 'the world of the artist' or 'the world of the carpenter'. A human being lives in many such worlds, and they often overlap, but what constitutes their essence - what Heidegger calls the worldhood of all such worlds - is the significance that accrues to things by their relatedness to human interests and possibilities. Although being-in and world can be distinguished, they never occur separately. Any set of meaning-giving relations (world) comes about and remains

effective only in so far as human being is engaged with the apposite possibilities (being-in). Being-in holds open and sustains the world.

In *Being and Time* Heidegger studies the world that he considers closest to human beings: the world of everyday activity. The defining moment of such a world is practical purposes ordered to human concerns - for example, the need to build a house for the sake of shelter. A group of things then gets its significance from the direct or indirect relation of those things to that goal. For example, these specific tools get their significance from their usefulness for clearing the ground, those trees get their significance from being suitable for lumber, these plants from their serviceability as thatch. A dynamic set of such relations (such as ‘useful to’, ‘suitable as’, ‘needed for’), all of which refer things to a human task and ultimately to a human possibility, constitutes a ‘world’ and defines the current significance that certain things (for example, tools, trees and reeds) might have.

The significance of things changes according to the interplay of human interests, the relations that they generate, and the availability of material. For example, given the lack of a mallet, the significance of a stone might be its utility for pounding in a tent peg. The stone gets its current significance as a utensil from the world of the camper: the desire for shelter, the need of something to hammer with, and the availability of only a stone. (When the camper finds a mallet, the stone may well lose its former significance.)

Hermeneutical understanding. Heidegger argues that the world of practical experience is the original locus of the understanding of the being of entities. Understanding entails awareness of certain relations: for example, the awareness of this *as* that, or of this *as for* that. The ‘as’ articulates the significance of the thing. In using an implement, one has a practical understanding of the implement’s relation to a task (X as useful for Y). This in turn evidences a practical understanding of the being of the implement: one knows the stone as *being* useful for pounding in a tent peg. In other words, prior to predicative knowledge, which is expressed in sentences of the type ‘S is P’, human beings already have a pre-theoretical or ‘pre-ontological’ understanding of the being of things (this as *being for* that).

Since the ‘as’ articulates how something is understood, and since the Greek verb *hermeneuein* means ‘to make something understandable’, Heidegger calls the ‘as’ that renders things intelligible in practical understanding the ‘hermeneutical as’. This ‘hermeneutical as’ is made possible because human being is a ‘thrown project’, necessarily thrust into possibilities (thrownness) and thereby holding the world open (project).

Hermeneutical understanding - that is, pre-predicatively understanding the ‘hermeneutical as’ by being a thrown project - is the kind of cognition that most befits being-in-the-world. It is the primary way in which humans know the being of things. By contrast, the more detached and objective ‘apophantic’ knowledge that expresses itself in declarative sentences (‘S is P’) is evidence, for Heidegger, of a derivative and flattened-out understanding of being.

Summary. As long as one lives, one is engaged in mortal becoming. This becoming entails having purposes and possibilities. Living into purposes and possibilities is how one has things meaningfully present. The ability to have things meaningfully present by living into possibilities is called being-in-the-world. Being-in-the-world is structured as a thrown project: holding open the possibility of significance (project) by ineluctably living into possibilities (thrownness). This issues in a pre-predicative, hermeneutical understanding of the being of things. Thus mortal becoming *qua* being-in-the-world engenders and sustains all possible significance. In another formulation: temporality determines all the ways that things can have meaningful presence. Time is the meaning of all forms of being.

4 Dasein and disclosure

Heidegger calls human being ‘Dasein’, the entity whose being consists in disclosing and understanding being, whether the being of itself or that of other entities. In so far as Dasein’s being is a disclosure of its *own* being, it is called ‘existence’ or ‘ek-sistence’: self-referential standing-out-unto-itself. Dasein’s very being consists in being related, with understanding and concern, to itself.

But Dasein is not just related to itself. Existence occurs only as being-in-the-world; that is, the openness of human being to itself entails the openness of the world for other entities. One of Heidegger’s neologisms for ‘openness’ is ‘the there’ (*das Da*), which he uses in two interrelated senses. First, human being is its own ‘there’: as a thrown

project, existence sustains its own openness to itself. And second, in so doing, human being also makes possible the world's openness as the 'there' for other entities. Human being's self-disclosure makes possible the disclosure of other entities.

Heidegger calls human being in both these capacities 'being-the-there' - Dasein, or sometimes Da-sein when it refers to the second capacity. In ordinary German *Dasein* means existence in the usual sense: being there in space and time as contrasted with not being at all. However, in Heidegger's usage Dasein means being disclosive of something (whether that be oneself or another entity) in its being. In a word, Dasein is disclosive. And since human being is radically finite, disclosure is radically finite.

The Greek word for disclosure is *alēthēia*, a term composed of the privative prefix *a-* (un- or dis-) and the root *lēthē* (hiddenness or closure). Heidegger finds the finitude of dis-closure inscribed in the word *a-lēthēia*. To disclose something is to momentarily rescue it from (*a-*) some prior unavailability (*lēthē*), and to hold it for a while in presence.

Heidegger discusses three levels of disclosure, ranging from the original to the derivative, each of which involves Dasein: (1) disclosure-as-such, (2) the disclosedness of entities in their being, and (3) disclosure in propositional statements. Heidegger's chief interest is in the first. There, disclosure/*alēthēia* is the original occurrence that issues in meaningful presence (being).

Heidegger argues that levels 1 and 2 are distinct but inseparable and, taken together, make possible level 3. The word 'truth' properly applies only at the third level, where it is a property of statements that correctly represent complex states of affairs. Therefore, to the question 'What is the essence of truth?' - that is, 'What makes the truth of propositions possible at level 3?' - Heidegger answers: Proximally, the disclosure of entities in their being (level 2); and ultimately, disclosure-as-such (level 1). His argument unfolds as follows.

Level 1. Disclosure-as-such is the very opening-up of the field of significance. It is the engendering and sustaining of world on the basis of Dasein's becoming-absent. In so far as it marks the birth of significance and the genesis of being, disclosure-as-such or world-disclosure is the reason why any specific entity can have meaningful presence at all.

There are three corollaries. First, the disclosure of world never happens except in Dasein's being; indeed, without Dasein, there is no openness at all. The engendering and sustaining of the dynamic relations that constitute the very possibility of significance occurs only as long as Dasein exists as mortal becoming. And conversely, wherever there is Dasein, there is world. Second, disclosure-as-such never happens apart from the disclosedness of *entities* as being this or that. In speaking of disclosure 'as such', Heidegger is naming the originating source and general structure of all possible significance that might accrue to any entity at all. The result of disclosure-as-such is the fact that referral-to-mortal-Dasein (that is, significance) is the basic state of whatever entities happen to show up. Third, disclosure-as-such is always prior to and makes possible concrete human action in any specific world. Such concrete actions run the risk of *not* being disclosive (that is, being mistaken about the meaning of something). By contrast, world-disclosure is *always* disclosive in so far as it is the opening-up of the very possibility of significance at all.

Alēthēia/disclosure-as-such - how it comes about, the structure it has, and what it makes possible - is the central topic or 'thing itself' of Heidegger's thought. He sometimes calls it the 'clearing' of being. He also calls it 'being itself' or 'being-as-such' (that is, the very *engendering* of being). Frequently, and inadequately, he calls it the 'truth' of being.

Level 2. What disclosure-as-such makes possible is the pre-predicative availability of entities in their current mode of being. This pre-predicative availability constitutes level 2, the basic, everyday disclosedness of entities as meaningfully present. This disclosedness is always finite, and that entails two things.

First, what disclosure-as-such makes possible is not simply the being of an entity but rather the being of that entity as or as not something: for instance, this stone as not a missile but as a hammer. I know the stone only in terms of one or another of its possibilities: the entity becomes present not fully and immediately but only partially and discursively. Thus the entity's being is always finite, always a matter of synthesis-and-differentiation: being-as-and-as-not. Second, disclosure-as-such lets an entity be present not in its eternal essence but only in its

current meaning in a given situation; moreover, it shows that this specific entity is not the only one that might have this meaning. For example, in the present situation I understand this stone not as a paperweight or a weapon but as a hammer. I also understand it as not the best instrument for the job: a mallet would do better.

Even though it is a matter of synthesis-and-differentiation, this pre-predicative hermeneutical understanding of being requires no thematic articulation, either mental or verbal, and no theoretical knowledge. It usually evidences itself in the mere doing of something. Nevertheless, in a more developed but still pre-predicative moment, such a hermeneutical awareness might evolve into a vague sense of the entity's being-this-or-that ('whatness'), being-in-this-way-or-that ('howness'), and being-available-at-all ('thatness'). Still later, these vague notions might lose the sense of *current* meaningfulness and develop, at level 3, into the explicit metaphysical concepts of the essence, modality and existence of the entity.

The second level of disclosure may be expressed in the following thesis: within any given world, to be an entity is to be always already disclosed as something or other. This corresponds to the traditional doctrine of metaphysics concerning a trans-generic (transcendental) characteristic of anything that is: regardless of its kind or species, every entity is intrinsically disclosed in its being (*omne ens est verum*).

Heidegger argues that while it is based on and is even aware of this second level of disclosure, metaphysics has no explicit understanding of disclosure-as-such or of its source in being-in-the-world. What is more, he claims that the disclosedness of entities-in-their-being (level 2) tends to overlook and obscure the very disclosure-as-such (level 1) that originally makes it possible. He further argues that there is an intrinsic hiddenness about disclosure-as-such, which makes overlooking it virtually inevitable (see §6).

Level 3. Being-in-the-world and the resultant pre-predicative disclosedness of entities as being-thus-and-so make it possible for us to enact the predicative disclosure of entities. At this third level of disclosure we are able to represent correctly to ourselves, in synthetic judgments and declarative sentences, the way things are in the world. A correct synthetic representation of a complex state of affairs (a correct judgment) is 'true', that is, disclosive of things just as they present themselves. Such a predicative, apophantic sentence ('S is P') is able to be true only because world-disclosure has already presented an entity as significant at all and thus allowed it to be taken as thus and so. This already disclosed entity is the binding norm against which the assertion must measure itself.

At level 3, however, it is also possible to *mis*represent things in thought and language, to fail to disclose them just as they present themselves in the world. At level 1 Dasein is always and only disclosive. But with predicative disclosure at level 3 (as analogously with hermeneutical disclosure at level 2) Dasein's representing of matters in propositional statements may be either disclosive or non-disclosive, either true or false.

One of Heidegger's reasons for elaborating the levels of disclosure is to demonstrate that science, metaphysics and reason in general, all of which operate at level 3, are grounded in a more original occurrence of disclosure of which they are structurally unaware. This is what he intends by his claim 'Science does not think'. He does not mean scientists are stupid or their work uninformed, nor is he disparaging reason and its accomplishments. He means that science, by its very nature, is not focused on being-in-the-world, even though being-in-the-world is ultimately responsible for the meaningful presence of the entities against which science measures its propositions.

5 Hiddenness, *Ereignis* and the Turn

Hiddenness. Heidegger claims that disclosure-as-such - the very opening up of significance in Dasein's being - is intrinsically hidden and needs to remain so if entities are to be properly disclosed in their being. This intrinsic concealment of disclosure-as-such is called the 'mystery'. Since Heidegger sometimes calls disclosure-as-such 'being itself', the phrase becomes 'the mystery of being'. The ensuing claim, that the mystery of being conceals itself while revealing entities, has led to much mystification, not least among Heideggerians. Being seems to become a higher but hidden Entity that performs strange acts that only the initiated can comprehend. This misconstrual of Heidegger's intentions is not helpful.

How may we understand the intrinsic concealment of disclosure-as-such? One way is to understand the paradigm of 'movement' that informs Heidegger's discussion of revealing and concealing. Taken in the broad philosophical sense, movement is defined not as mere change of place and the like, but as the very being of entities that are undergoing the process of change. This kind of being consists in anticipating something absent, with the result that

what is absent-but-anticipated determines the entity's present being. Anticipation *is* the being of such entities, and anticipation is determined from the absent-but-anticipated goal. For example, the acorn's being is its becoming an oak tree; and correspondingly the future oak tree, as the goal of the acorn's trajectory, determines the acorn's present being. Likewise, Margaret *is* a graduate student in so far as she is in movement towards her Ph.D. The still-absent degree *qua* anticipated determines her being-a-student.

The absent is, by nature, hidden. But when it is anticipated or intended, the intrinsically hidden, while still remaining absent, becomes quasi-present. It functions as the 'final cause' and *raison d'être* that determines the being of the anticipating entity. That is, even while remaining intrinsically concealed, the absent-as-anticipated 'gives being' (*Es gibt Sein*) to the anticipating entity by disclosing the entity as what it presently is. This pattern of absence-dispensing-presence holds both for the disclosure of Dasein and for the disclosure of the entities Dasein encounters.

It holds pre-eminently for Dasein. Dasein's being is movement, for Dasein exists by anticipating its own absence. Dasein's death remains intrinsically hidden, but when anticipated, the intrinsically hidden becomes quasi-present by determining Dasein's being as mortal becoming. The absent, when anticipated, dispenses Dasein's finite presence.

The same holds for other entities. The anticipated absence determines Dasein's finite being. But Dasein's being is world-disclosive: it holds open the region of meaningful presence in which other entities are disclosed as being-this-or-that. Hence, the intrinsically hidden, when anticipated, determines the presence not only of Dasein but also of the entities Dasein encounters.

Therefore, the very structure of disclosure - that is, the fact that the absent-but-anticipated determines or 'gives' finite presence - entails that its ultimate source remain intrinsically hidden even while disclosing the being of entities. This intrinsic hiddenness at the core of disclosure is what Heidegger calls the 'mystery'. Heidegger argued that the 'mystery' is the ultimate issue in philosophy, and he believed Heraclitus had said as much in his fragment no. 123: 'Disclosure-as-such loves to hide' (Freeman 1971: 33).

Ereignis. The paradigm of movement also explains why Heidegger calls disclosure-as-such '*Ereignis*'. In ordinary German *Ereignis* means 'event', but Heidegger uses it as a word for movement. Playing on the adjective *eigen* ('one's own'), he creates the word *Ereignung*: movement as the process of being drawn into what is one's own. For example, we might imagine that the oak tree as final cause 'pulls' the acorn into what it properly is, by drawing the acorn towards what it is meant to be. This being-pulled is the acorn's movement, its very being. Likewise, Dasein is 'claimed' by death as its final cause and 'pulled forth' by it into mortal becoming. This being-drawn into one's own absence, in such a way that world is engendered and sustained, is what Heidegger calls 'appropriation'. It is what he means by *Ereignis*.

The word '*Ereignis*', along with the image of Dasein being appropriated by the absent, emerges in Heidegger's thought only in the 1930s. However, this later language echoes what Heidegger had earlier called Dasein's thrownness, namely, the fact that Dasein is thrust into possibilities, anticipates its self-absence, and so is 'already' involved in world-disclosure. Both the earlier language of thrown anticipation *of* absence, and the later language of appropriation *by* absence, have the same phenomenon in view: Dasein's alreadiness, its constitutive mortality that makes for world-disclosure.

The paradigm of movement also helps to clarify Heidegger's claim about the concealing-and-revealing, or withdrawing-and-arriving, of being itself (that is, of disclosure-as-such). In a quite typical formulation Heidegger writes: 'Being itself withdraws itself, but as this withdrawal, being is the 'pull' that claims the essence of human being as the place of being's own arrival' (1961: vol. 2, 368). This sentence, which describes the structure of *Ereignis*, may be interpreted as follows:

The 'withdrawal' of disclosure-as-such
(that is, the intrinsic hiddenness of world-disclosive absence)
maintains a relation to Dasein
(which we may call either 'appropriation' or 'thrown anticipation')
that claims Dasein
(by appropriating it into mortal becoming)

so that, *in* Dasein's being,
(in so far as Dasein's being is the openness that is world)
being itself might arrive
(in the form of the relations of significance whereby entities have being-as this-or-that).

The Turn. One can notice a certain shift within Heidegger's work beginning around 1930, both in his style and in the topics he addresses. As regards style, some have claimed that his language becomes more abstruse and poetic, and his thinking less philosophical than mystical. As regards substance, he seems to introduce new topics like 'appropriation' and the 'history of being'.

The problem is to discern whether these and other shifts count as what Heidegger calls the Turn (*die Kehre*). Some argue that beginning in the 1930s Heidegger radically changed his approach and perhaps even his central topic. The early Heidegger, so the argument goes, had understood being itself (that is, disclosure-as-such) from the standpoint of Dasein, whereas the later Heidegger understands Dasein from the standpoint of being itself. But to the contrary it is clear that even the early Heidegger understood Dasein only from the standpoint of being itself.

Heidegger clarifies matters by distinguishing between (1) the Turn and (2) the 'change in thinking' that the Turn demands, both of which are to be kept distinct from (3) the various shifts in form and focus that his philosophy underwent in the 1930s. The point is that, properly speaking, the Turn is not a shift in Heidegger's thinking nor a change in his central topic. The Turn is only a further specification of *Ereignis*. There are three issues here.

First, the 'Turn' is a name for how *Ereignis* operates. *Ereignis* is the appropriation of Dasein for the sake of world-disclosure. For Heidegger, this fact stands over against all theories of the self as an autonomous subject that presuppositionlessly (that is, without a prior world-disclosure) posits its objects in meaning. In opposition to that, *Ereignis* means that Dasein must already be appropriated into world-disclosive absence before anything can be significant at all.

Ereignis also means that Dasein's appropriation by, or thrownness into, world-disclosive absence is the primary and defining moment in Dasein's projection of that disclosure. This reciprocity (*Gegenschwung*) between appropriation/thrownness on the one hand and projection on the other - with the priority going to appropriation/thrownness - constitutes the very structure of *Ereignis* and is what Heidegger calls the Turn. The upshot of this reciprocity is that Dasein must be already pulled into world-disclosive absence (thrown or appropriated into it) if it is to project (that is, hold open) disclosure at all. In a word, the Turn *is Ereignis*.

Second, the 'change in thinking' refers to the personal conversion that the Turn demands. To become aware of the Turn and to accept it as determining one's own being is what Heidegger had earlier called 'resolution' and what he now describes as 'a transformation in human being'. This transformation into an authentic self consists in letting one's own being be defined by the Turn.

Third, the shifts in Heidegger's work in the 1930s - and especially the development and deepening of his insights into thrownness and appropriation - are just that: shifts and developments within a single, continuing project. Important as they are, they are neither the Turn itself nor the change in personal self-understanding that the Turn requires.

6 Forgetfulness, history and metaphysics

Heidegger sees a strong connection between the forgetting of disclosure-as-such, the history of the dispensations of being, and metaphysics.

Forgetting disclosure-as-such. Because disclosure-as-such is intrinsically hidden (this is what is meant by the mystery), it is usually overlooked. When the mystery is overlooked, human being is 'fallen', that is, aware of entities as being-thus-and-so, but oblivious of what it is that 'gives' being to entities. Fallenness is forgetfulness of the mystery. Another term for fallenness is 'errancy', which conveys the image of Dasein 'wandering' among entities-in-their-being without knowing what makes their presence possible. Since disclosure-as-such is sometimes called 'being itself', fallenness is also called 'the forgetfulness of being'.

However, disclosure-as-such need not be forgotten. It is possible, in resolution, to assume one's mortality and become concretely aware of disclosure-as-such in its basic state of hiddenness. Such awareness does not undo the

intrinsic hiddenness of disclosure-as-such or draw it into full presence. Rather, one accepts the concealment of being itself (this is called ‘letting being be’) by resolutely accepting one’s appropriation by absence.

The history of the dispensations of being. Heidegger’s discussions of the ‘history of being’ sometimes verge on the anthropomorphic, and he often uses etymologies that are difficult to carry over into English. Nevertheless, his purpose in all this is clear: to spell out the world-historical dimensions of fallenness.

As we have seen, disclosure-as-such ‘gives’ the being of entities while the ‘giving’ itself remains hidden; and this happens only in so far as Dasein is appropriated by absence. When one forgets the absence that appropriates Dasein, and thus forgets the hidden giving that brings forth the being of entities, fallenness and errancy ensue. Fallen Dasein then focuses on the given (entities-in-their-being) and overlooks the hidden giving (disclosure-as-such). None the less, the hidden giving still goes on giving, but now in a doubly hidden way: it is both intrinsically hidden *and* forgotten. When the hiddenness is forgotten, a disclosure is called a ‘dispensation’ (*Geschick*) of being. The word connotes a portioning-out that holds something back. A certain form of the being of entities is dispensed while the disclosing itself remains both hidden and forgotten.

In German, ‘dispensation’ (*Geschick*) and ‘history’ (*Geschichte*) have their common root in the verb *schicken*, ‘to send’. Playing on those etymologies, Heidegger elaborates a ‘history’ of being, based on the ‘sendings’ or ‘dispensations’ of being. (The usual translations of *Geschick* as ‘fate’ or ‘destiny’ are not helpful here.) In Heidegger’s view each dispensation of being defines a distinct epoch in the history of thought from ancient Greece down to today. He calls the aggregate of such dispensations and epochs the ‘history of being’. Because the whole of these dispensations and epochs is correlative to fallenness, Heidegger seeks to overcome the history of being and return to an awareness of the hidden giving.

Heidegger believes the parameters of each epoch in the history of being can be glimpsed in the name that a major philosopher of the period gave to the being of entities in that age. A non-exhaustive list of such epoch-defining notions of being includes: *idea* in Plato, *energeia* in Aristotle, act in Aquinas, representedness in Descartes, objectivity in Kant, Absolute Spirit in Hegel, and will to power in Nietzsche. What characterizes each such epoch is (1) an understanding of being as some form of the presence of entities and (2) an oblivion of the absence that bestows such presence. None the less, even when forgotten the absence is never abolished, and thus traces of it remain in the various dispensations. Therefore, in studying the texts of classical philosophy Heidegger searches for and retrieves the unexpressed absence (the ‘unsaid’) that hides behind what the text actually expresses (the ‘said’).

Metaphysics. The various ways that presence or being has been dispensed, while absence has been overlooked, are called in their entirety ‘metaphysics’. Heidegger argues that metaphysics as a philosophical position began with Plato and entered its final phase with Nietzsche.

The Greek philosophers who preceded Socrates and Plato were, in Heidegger’s view, *pre*-metaphysical in so far as they had at least a penumbral awareness of disclosure-as-such and at least named it (Heraclitus, for example, called it *logos*, *alētēia*, and *physis*). However, none of these thinkers thematically addressed disclosure-as-such or understood the correlative notions of ek-sistence and Dasein. Heidegger calls the penumbral awareness of disclosure-as-such among archaic Greek thinkers the ‘first beginning’. And he hoped that a ‘new beginning’ would follow the end of metaphysics. If the first beginning was not yet metaphysical, the new beginning will be no longer metaphysical. Heidegger considered his own work a preparation for that new beginning.

But metaphysics persists. The history of the dispensations of being has reached its fullness in the present epoch of technology. As Heidegger uses the word, ‘technology’ refers not to hardware or software or the methods and materials of applied science. Rather, it names a dispensation in the history of metaphysics, in fact the final one. It names the way in which entities-in-their-being are disclosed today.

Heidegger maintains that in the epoch of technology entities are taken as a stockpile of matter that is in principle completely knowable by human reason and wholly available for human use. With this notion metaphysics arrives at its most extreme oblivion of disclosure-as-such. In our time, Heidegger says, the presence of entities has become everything, while the absence that brings about that presence has become nothing. He calls this nil-status of absence ‘nihilism’.

Overcoming metaphysics. None the less, Heidegger sees a glimmer of light in the dark epoch of nihilism. In this

final dispensation of metaphysics, the hidden giving does not cease to function, even when it is completely forgotten. It continues dispensing presence - paradoxically even the nihilistic presence which obscures the absence that gives it. Because the hidden giving goes on giving even when it is forgotten, we can still experience it today (in a mood not unlike dread) and retrieve it. This recovery of world-disclosive absence requires resolution or, as Heidegger now calls it, 'the entrance into *Ereignis*'. To enter *Ereignis* today is to experience a different kind of *nihil* ('nothing') from the one that defines nihilism. The absence that bestows presence is itself a kind of 'nothing' (not-a-thing). This absence is no entity, nor can it be reduced to the being of any specific entity or be present the way an entity is. That is why it is so easily overlooked. Its 'nothingness' is its intrinsic hiddenness.

To enter *Ereignis* is to become aware of and to accept the disclosive *nihil* that rescues one from nihilism. Thereupon, says Heidegger, metaphysics as the history of the dispensations of being ceases and a new beginning takes place - at least for those individuals who achieve authenticity by way of resolution. But metaphysics will continue for those who remain inauthentic, because dispensation is correlative to fallenness.

Summary. The forgetting of disclosure-as-such is metaphysics. Metaphysics knows entities-in-their-being but ignores the very giving of that being. The aggregate of the epochs of metaphysics is the history of the dispensations of being. The history of these dispensations culminates in the epoch of technology and nihilism. But world-disclosive absence can still be retrieved; and when it is retrieved, it ushers in (at least for authentic individuals) a new beginning of ek-sistence and Dasein.

7 The work of art

One of Heidegger's most challenging essays is 'The Origin of the Work of Art', originally drafted in 1935 and published in an expanded version only in 1950. There he distinguishes between the work of art as a specific entity (for example, a poem or a painting) and art itself, the latter being understood not as a collective name for, but rather as the essence and origin of, all works of art. Heidegger asks what art itself is, and he answers that art is a unique kind of disclosure.

Dasein is disclosive of the being of an entity in many ways, some of them ordinary and some of them extraordinary. An outcome common to both kinds of disclosure is that the disclosed entity is seen as what it is: it appears in its form. Examples of ordinary, everyday ways of disclosing the being of entities include showing oneself to be adept at the flute, or moulding clay into a vase, or concluding that the accused is innocent. Each of these ordinary cases of praxis, production and theory does indeed disclose some entity as being this or that, but the focus is on showing what the *entity* is rather than on showing how the entity's *being* is disclosed. On the other hand, extraordinary acts of disclosure bring to attention not only the disclosed entity but above all the event of disclosure of that entity's being. Extraordinary acts of disclosure let us see the very fact that, and the way in which, an entity has become meaningfully present in its being. In these cases not only does an entity appear in its form (as happens in any instance of disclosure) but more importantly the very disclosure of the being of the entity 'is established' (*sich einrichten*) in the entity and is seen there as such.

Heidegger lists five examples of extraordinary disclosure: the constitution of a nation-state; the nearness of god; the giving of one's life for another; the thinker's questioning as revealing that being can be questioned; and the 'installation' (*Sich-ins-Werk-Setzen*) of disclosure in a work of art. Each of these cases discloses, in its own particular way, not just an entity but the very disclosure of that entity's being. Heidegger seeks to understand the particular way in which art itself discloses disclosure by 'installing' disclosure in the work of art.

In his essay Heidegger refers mainly to two works of art: van Gogh's canvas 'Old Shoes', painted in Paris in 1886-7 and now hung in the Stedelijk Museum, Amsterdam; and the 5th century BC Doric Temple of Hera II - the so-called Temple of Poseidon - at Paestum (Lucania), Italy. Let us consider the temple at Paestum as we attempt to answer two questions: what gets disclosed in a work of art and how does it get disclosed?

(1) *What gets disclosed in a work of art?* Heidegger gives three answers. First, a work of art lets us see disclosure in the form of 'world' and 'earth'. A work of art discloses not just an entity or an ensemble of entities but the whole realm of significance whereby an ensemble of entities gets its finite meaning. The temple at Paestum not only houses (and thus discloses) the goddess Hera, but more importantly lets us see the social and historical world - rooted as it was in the natural setting of Lucania - that Hera's presence guaranteed for the Greek colonists. A work of art, Heidegger argues, reveals the very event of disclosure, which event he calls the happening of world

and earth, where ‘earth’ refers not only to nature and natural entities but more broadly to all entities within a specific world.

Second, a work of art lets us see the radical tension that discloses a specific world of significance. Heidegger understands being-in-the-world as a ‘struggle’ (*Streit* or *polemos*) between a given world and its earth, between the self-expanding urge of a set of human possibilities and the rootedness of such possibilities in a specific natural environment. Here, ‘struggle’ is another name for the event of disclosure whereby a particular world is opened up and maintained. What a specific work of art discloses is one particular struggle that discloses one particular world - for instance, the world of the Greek colonists at Paestum.

Third, a work of art shows us disclosure-as-such. The movement of opening up a particular world is only one instance of the general movement of *alēthēia*: the ‘wresting’ of being-at-all from the absolute absence into which Dasein is appropriated. Thus a work of art not only shows us a particular world-disclosive struggle (the way the temple of Hera shows us the earth-world tension at Paestum) but also lets us see the ‘original struggle’ (*Urstreit*) of disclosure-as-such, whereby significance is wrested from the double closure of intrinsic hiddenness and fallenness.

In short, what a work of art reveals is disclosure in three forms: as world and earth; as the struggle that opens up a specific world and lets its entities be meaningful; and as the original struggle that structures all such particular disclosures.

(2) *How does a work of art disclose disclosure?* The specific way that art discloses disclosure is by ‘installing’ it in a given work of art. Here, ‘to install’ means to bring to stability; and ‘to install disclosure’ means to incorporate it into the physical form of a work of art. There are three corollaries:

What the installing is not. Heidegger does not claim that the work of art ‘sets up’ the world and ‘sets forth’ the earth for the first time. That is, installing the disclosure of earth and world in the work of art is not the only or even the first way that earth and world get disclosed. The sanctuary of Hera was not the first to open up the world of Paestum and disclose the fields and flocks for what they are. Tradesmen and farmers had been doing that - that is, the disclosive struggle of world and earth had been bestowing form and meaning - for at least a century before the temple was built.

What the installing is and does. Art discloses, in a new and distinctive way, a disclosure of earth and world that is already operative. Heidegger argues that the temple as disclosive (a) captures and sustains the openness of that world and its rootedness in nature, and (b) shows how, within that world, nature comes forth into the forms of entities while remaining rooted in itself. Heidegger calls these two functions, which happen only in art, the ‘setting up’ of world and the ‘setting forth’ of earth.

The work of art lets us see - directly, experientially and in all its glory - the already operative interplay of human history’s rootedness in nature and nature’s emergence into human history. In Heidegger’s words, art ‘stabilizes’ (*zum Stehen bringen*) the disclosive struggle of world and earth by ‘installing’ it in a particular work of art, such that in and through that medium, disclosure ‘shines forth’ brilliantly in beauty.

The two ways art discloses disclosure, and their unity. Art itself is a specific and distinctive way in which Dasein is disclosive: it discloses disclosure by installing disclosure in the physical form of a work of art. This installation has two moments: the creation and the preservation of the work of art.

Creation is an artist’s Dasein-activity of incorporating disclosure - the world-openness that is already operative - into a material medium (stone, colour, language and so on). This incorporation of disclosure is carried out in such a way that the material medium is not subordinated to anything other than disclosure (for example, it is not subordinated to ‘usefulness’). Rather, the medium becomes, for whoever experiences it, the immediate disclosure of disclosure.

Preservation is the corresponding Dasein-activity of maintaining the power of disclosure in the work of art by resolutely letting disclosure continue to be seen there. Creation and preservation are the two ways that Dasein ‘projects’ (holds open and sustains) the disclosure that is installed in the work of art. The unity of creation and preservation is art itself, which Heidegger calls *Dichtung* - not ‘poetry’ but *poiesis*, the creating-and-preserving installation of disclosure in a disclosive medium.

Disclosure is the central topic of all Heidegger's philosophy, and this fact shines brilliantly through his reflection on the origin of the work of art. Art, both as creation and as preservation, is a specific and distinctive Dasein-activity: the disclosure of disclosure in a medium that is disclosive. In the work of art, as in Heidegger's own work, it's *alēthēia* all the way down.

THOMAS SHEEHAN

List of works

Heidegger, M. (1975-) *Gesamtausgabe (Collected Edition)*, Frankfurt: Vittorio Klostermann.(The standard edition of Heidegger's works. Over eighty volumes are projected, of which more than forty appeared by 1997. English translations of individual volumes are given at the end of the list of works below.)

Heidegger, M. (1914) *Die Lehre vom Urteil im Psychologismus. Ein kritisch-positiver Beitrag zur Logik (The Doctrine of Judgment in Psychologism: A Critical-positive Contribution to Logic)*, Leipzig: Barth. (Heidegger's doctoral dissertation.)

Heidegger, M. (1916) *Die Kategorien- und Bedeutungslehre des Duns Scotus (Duns Scotus' Doctrine of Categories and Meaning)*, Tübingen: J.C.B. Mohr (Paul Siebeck). (Heidegger's Habilitationsschrift, the qualifying dissertation required for teaching at a university.)

Heidegger, M. (1927) 'Sein und Zeit', *Jahrbuch für Philosophie und phänomenologische Forschung* 8: 1-438; *Sein und Zeit*, Halle an der Salle: Max Niemeyer; trans. J. Macquarrie and E. Robinson, *Being and Time*, New York: Harper & Row, 1962; trans. J. Stambaugh, *Being and Time*, Albany, NY: State University of New York Press, 1996.(Heidegger's most famous work, which treats the structure of Dasein as being-in-the-world and as temporal. The unpublished second half of the work was to have shown that the meaning of being is time.)

Heidegger, M. (1929a) 'Vom Wesen des Grundes', *Jahrbuch für Philosophie und phänomenologische Forschung*, supplement 71-100; trans. T. Malick, *The Essence of Reasons*, Evanston, IL: Northwestern University Press, 1969; trans. W. McNeill, 'On the Essence of Ground', in *Pathmarks*, New York: Cambridge University Press, 1997. (An essay on truth, transcendence and ground, written in honour of Edmund Husserl's 80th birthday, April 1929.)

Heidegger, M. (1929b) *Kant und das Problem der Metaphysik*, Bonn: Friedrich Cohen; trans. R. Taft, *Kant and the Problem of Metaphysics*, Bloomington, IN: Indiana University Press, 1990.(Originally conceived as part of the second half of *Sein und Zeit*, this work argues that the hidden meaning of the transcendental imagination in the 'A' version of Kant's *Critique of Pure Reason* is the temporality of Dasein as presented in *Sein und Zeit*.)

Heidegger, M. (1929c) *Was ist Metaphysik?*, Bonn: Friedrich Cohen; trans. D.F. Krell, 'What is Metaphysics?', in D.F. Krell, *Basic Writings*, revised edn, San Francisco: Harper, 1993; and in *Pathmarks*, New York: Cambridge University Press, 1997.(Heidegger's inaugural address as Husserl's successor at Freiburg University. It discusses boredom as a 'basic mood' and broaches the topic of being as 'the nothing' or 'not-a-thing'.)

Heidegger, M. (1933) *Die Selbstbehauptung der deutschen Universität*, Breslau: Wilhelm Gottlieb Korn; trans. K. Harries, 'The Self-Assertion of the German University', *Review of Metaphysics* (1985) 38: 470-80. (Heidegger's controversial inaugural address as rector of Freiburg University, 27 May 1933.)

Heidegger, M. (1942) 'Platons Lehre von der Wahrheit', *Geistige Überlieferung* 2: 96-124; trans. J. Barlow, 'Plato's Doctrine of Truth', in W. Barrett (ed.) *Philosophy in the Twentieth Century*, New York: Random House, 1962, vol. 2; trans. T. Sheehan, 'Plato's Doctrine of Truth', in *Pathmarks*, New York: Cambridge University Press, 1997.(This close reading of Allegory of the Cave in Plato's *Republic* argues that Plato inaugurates the metaphysical notion of truth as correspondence.)

Heidegger, M. (1943a) *Vom Wesen der Wahrheit*, Frankfurt: Vittorio Klosterman; trans. J. Sallis, 'On the Essence of Truth', in D.F. Krell (ed.) *Basic Writings*, revised edn, San Francisco: Harper, 1993; and 'On the Essence of Truth', in *Pathmarks*, New York: Cambridge University Press, 1997.(Originally drafted in 1930, the essay discusses the levels of disclosure: propositional truth, the manifestness of entities, and disclosure-as-such or *aletheia*.)

Heidegger, M. (1947) 'Brief über den Humanismus', in *Platons Lehre von der Wahrheit. Mit einem Brief über den Humanismus*, Bern: Francke; trans. F.A. Capuzzi, 'Letter on Humanism', in D.F. Krell (ed.) *Basic Writings*, revised edn, San Francisco: Harper, 1993; and in *Pathmarks*, New York: Cambridge University Press, 1997.(Written as an open letter to Jean Beaufret, Heidegger's first publication after the Second World War reveals the shifts his thinking had undergone in the 1930s.)

Heidegger, M. (1950) *Holzwege (Forest Paths)*, Frankfurt: Vittorio Klosterman.(A collection of essays dating from 1936 to 1946.)The following six references are the translations into English of all the essays contained in

Holzwege. Dates within parentheses indicate the original redaction of the German text.

Heidegger, M. (1935) ‘The Origin of the Work of Art’, trans. A. Hofstadter, in D.F. Krell (ed.) *Basic Writings*, revised edn, San Francisco: Harper, 1993.(Originally delivered as a lecture in 1935, the essay argues that art, taken as the essence of any work of art, consists in disclosing disclosure by ‘installing’ it in the physical medium of the work.)

Heidegger, M. (1938) ‘The Age of the World Picture’, in W. Lovitt (trans. and ed.) *The Question Concerning Technology and Other Essays*, New York: Harper & Row, 1977.(Originally delivered as a lecture in 1938, the essay discusses, among other things, the birth of modernity with Descartes’ view of thinking as the representation of entities by the subject as unshakable foundation.)

Heidegger, M. (1942-3) *Hegel’s Concept of Experience*, trans. J.G. Gray, New York: Harper & Row, 1970. (Drawn from seminars Heidegger gave in 1942-3, the essay presents Hegel as the culmination of subject-centred metaphysics.)

Heidegger, M. (1943b) ‘The Word of Nietzsche "God is Dead"’, in W. Lovitt (trans. and ed.) *The Question Concerning Technology and Other Essays*, New York: Harper & Row, 1977.(Originally presented in 1943 (but drawing on lecture courses dating from 1936 to 1940), the essay interprets no. 125 of Nietzsche, *The Gay Science*, and other texts, in order to present Nietzsche’s thought as the culmination of Western metaphysics.)

Heidegger, M. (1946a) ‘What Are Poets For?’, trans. A. Hofstadter, in D.F. Krell (ed.) *Poetry, Language, Thought*, New York: Harper & Row, 1971.(Given as a lecture to commemorate the twentieth anniversary of Rainer Maria Rilke’s death, the essay argues that the poet was both subject to Nietzschean nihilism and attempted to overcome it by recovering the authentic sense of language.)

Heidegger, M. (1946b) ‘The Anaximander Fragment’, trans. D.F. Krell, in D.F. Krell and F.A. Capuzzi (eds) *Early Greek Thinking*, New York: Harper & Row, 1975.(Dating from 1946 but drawing on work done as early as 1932, this essay provides a close reading of Anaximander’s Fragment 1 and offers some remarks on the history of being.)

Heidegger, M. (1951a) *Erläuterungen zu Hölderlins Dichtung (Elucidations of Hölderlin’s Poetry)*, Frankfurt: Vittorio Klostermann; 4th expanded edn, 1971.(Six essays on Hölderlin’s poetry.)Two of these essays on Hölderlin’s poetry have been translated into English and are given below. Dates within parentheses indicate the original redaction of the German text.

Heidegger, M. (1936) ‘Hölderlin and the Essence of Poetry’, in W. Brock (ed.) *Existence and Being*, Chicago: Henry Regnery, 1949.(Delivered as a lecture in Rome in 1936 and first published the following year, the essay presents Hölderlin as the ‘poet of poetry’ and reflects on *poiēsis* as the ‘establishment’ of disclosure.)

Heidegger, M. (1943c) ‘Remembrance of the Poet’, in W. Brock (ed.) *Existence and Being*, Chicago, IL: Henry Regnery, 1949.(Given as a lecture in June 1943, at the centenary celebration of Hölderlin’s death, the essay interprets the poet’s elegy ‘Heimkunft/An den Verwandten’ (‘Homecoming/To the Kinsmen’) and reflects on the poet’s relation to disclosure-as-such, here called ‘the holy’.)

Heidegger, M. (1953a) *Einführung in die Metaphysik*, Tübingen: Max Niemeyer; trans. R. Manheim, *An Introduction to Metaphysics*, New Haven, CT: Yale University Press, 1959.(A lecture course from 1935, treating among other things Heidegger’s interpretation of the meaning of being in Parmenides and Heraclitus.)

Heidegger, M. (1954) *Vorträge und Aufsätze (Lectures and Essays)*, Pfullingen: Günter Neske. (A collection of eleven essays, ranging in date from 1936 to 1954.)Ten of the eleven essays in *Vorträge und Aufsätze* have been translated into English and are given below. Dates within parentheses indicate the original redaction of the German text.

Heidegger, M. (1936-46) ‘Overcoming Metaphysics’, in J. Stambaugh (trans. and ed.) *The End of Philosophy*, New York: Harper & Row, 1973.(Thirty-eight brief notes, dating from 1936 to 1946, on the overcoming of metaphysics.)

Heidegger, M. (1943d) ‘Aletheia’, trans. F.A. Capuzzi, in D.F. Krell and F.A. Capuzzi (eds) *Early Greek Thinking*, New York: Harper & Row, 1975.(Drawing on Heidegger’s 1943 course, ‘The Beginning of Western Thinking (Heraclitus)’, the text, first published in 1954, interprets Heraclitus’ Fragment 16 in the light of what Heidegger calls ‘the clearing’/disclosure-as-such.)

Heidegger, M. (1944) ‘Logos’, trans. D.F. Krell, in D.F. Krell and F.A. Capuzzi (eds) *Early Greek Thinking*, New York: Harper & Row, 1975.(Drawing on Heidegger’s 1944 course ‘Logic (Heraclitus’ Doctrine of *Logos*)’ the text interprets Heraclitus’ Fragment 50 in the light of the relation between disclosure-as-such and Dasein’s correspondence to it.)

Heidegger, M. (1949a) ‘The Thing’, trans. A. Hofstadter, in D.F. Krell (ed.) *Poetry, Language, Thought*, New York: Harper & Row, 1971.(Written in 1949, delivered as a lecture in June 1950, and first published in 1951, the essay offers a phenomenological description of a wine-pitcher as a way of reflecting on the ‘nearness’ of

things.)
Heidegger, M. (1949b) ‘The Question Concerning Technology’, in W. Lovitt (trans. and ed.) *The Question Concerning Technology and Other Essays*, New York: Harper & Row, 1977.(Written and delivered as a lecture in 1949 under the title ‘Das Gestell’, (‘The Enframing’), then delivered under its present title, ‘Die Frage nach der Technik’, in 1953 and published in the following year, the text argues that technology is not primarily something instrumental (a means to an end) but a form of disclosure, and that modern technology, as the demand for complete disclosure, is intrinsically nihilistic.)
Heidegger, M. (1951b) ‘Building Dwelling Thinking’, trans. A. Hofstadter, in D.F. Krell (ed.) *Poetry, Language, Thought*, New York: Harper & Row, 1971.(Delivered as a lecture in 1951 and first published in the following year, the text meditates on the ‘nearness’ of things in terms of the ‘bringing-forth’ (*poiesis*) of things.)
Heidegger, M. (1951c) ‘…Poetically Man Dwells…’, trans. A. Hofstadter, in D.F. Krell (ed.) *Poetry, Language, Thought*, New York: Harper & Row, 1971.(Delivered as a lecture in October 1951 and first published in 1954, the text reflects on Hölderlin and on poetry as a bringing-forth (*poiesis*) of things.
Heidegger, M. (1952) ‘Moira’, trans. F.A. Capuzzi, in D.F. Krell and F.A. Capuzzi (eds) *Early Greek Thinking*, New York: Harper & Row, 1975.(Originally planned as part of Heidegger’s 1951-2 lecture course ‘Was heißt Denken?’ the text interprets Parmenides’ Fragment 8, lines 34-41, and specifically the word ‘*moira*’, as referring to the togetherness of Dasein and disclosure-as-such.)
Heidegger, M. (1953b) ‘Science and Reflection’, in W. Lovitt (trans. and ed.) *The Question Concerning Technology and Other Essays*, New York: Harper & Row, 1977. (Delivered as a lecture in 1953, the text probes the thesis that science is the theory of the real and raises the question of disclosure as the concealed essence of science.)
Heidegger, M. (1953c) ‘Who is Nietzsche’s Zarathustra?’, trans. D.F. Krell, in *Nietzsche*, New York: Harper & Row, 1984, vol. 2.(Delivered as a lecture in May 1953, the essay interprets some major themes in Nietzsche - time and revenge, nihilism, eternal recurrence, will to power - and suggests that Zarathustra represents the togetherness of eternal recurrence and superman.)
Heidegger, M. (1956) *Was heißt Denken?*, Tübingen: Max Niemeyer; trans. F. D. Wieck and J.G. Gray, *What Is Called Thinking?*, New York: Harper & Row, 1968.(The text of Heidegger’s wide-ranging, two-semester lecture course, 1951-2.)
Heidegger, M. (1957a) *Der Satz vom Grund*, Pfullingen: Günther Neske; trans. R. Lilly, *The Principle of Reason*, Bloomington, IN: Indiana University Press, 1991.(The text of Heidegger’s lecture course, 1955-6.)
Heidegger, M. (1957b) *Identität und Differenz*, Pfullingen: Günther Neske; trans. J. Stambaugh, *Identity and Difference*, New York: Harper & Row, 1969.(Two lectures from 1957, one on the principle of identity, the other on the ontotheological structure of metaphysics.)
Heidegger, M. (1958) ‘Vom Wesen und Begriff der Φ[uacgr]σις. Aristoteles Physik B 1’, *Il Pensiero* 3: 131-56; 265-90; trans. T. Sheehan, ‘On the Being and Conception of PHYSIS in Aristotle’s *Physics* B, 1’, *Man and World* (1976) 9: 221-70; and in *Pathmarks*, New York: Cambridge University Press, 1997.(Based on Heidegger’s 1940 seminar, the text examines Aristotle’s understanding of *physis* (nature) and argues that *physis* originally meant disclosure-as-such.)
Heidegger, M. (1959a) *Gelassenheit*, Pfullingen: Günther Neske; trans. J.M. Anderson and E.H. Freund, *Discourse on Thinking*, New York: Harper & Row, 1966.(Two occasional pieces, one an imaginary dialogue dating from 1944, the other a speech commemorating the eighteenth-century composer Conradin Kreutzer, dating from 1955.)
Heidegger, M. (1959b) *Unterwegs zur Sprache*, Pfullingen: Günther Neske; trans. P.D. Hertz and J. Stambaugh, *On the Way to Language*, New York: Harper & Row, 1971.(Four essays and one dialogue, ranging in date from 1950 to 1958, dealing with the question of language.)
Heidegger, M. (1961) *Nietzsche*, Pfullingen: Günther Neske, 2 vols; trans. D.F. Krell and F. Capuzzi, *Nietzsche*, New York: Harper & Row, 1979-87, 4 vols.(Lecture courses and notes on Nietzsche, dating from 1936 to 1946.)
Heidegger, M. (1962) *Die Frage nach dem Ding. Zu Kants Lehre von der transzendentalen Grundsätzen*, Tübingen: Max Niemeyer; trans. W.B. Barton and V. Deutsch, *What Is a Thing?*, Chicago, IL: Henry Regnery, 1967.(The text of Heidegger’s lecture course of 1935-6, which includes a substantial discussion of the ‘Analytic of Principles’ in Kant’s *Critique*.)
Heidegger, M. (1967, 1976) *Wegmarken*, Frankfurt: Vittorio Klostermann; trans. and ed. D.F. Krell, W. McNeill and J. Sallis, *Pathmarks*, New York: Cambridge University Press, 1997.(A collection of fourteen of Heidegger’s most important essays, ranging in date from 1919 to 1961. The essays include Heidegger 1929a, 1929c, 1942, 1943, 1947 and ‘Zur Seinsfrage’ (‘The Question of Being’) 1955.)

Heidegger, M. (1969) *Zur Sache des Denkens*, Tübingen: Max Niemeyer; trans. J. Stambaugh, *On Time and Being*, New York: Harper & Row, 1972.(Four shorter texts dating from 1961 to 1964, including the 1962 lecture 'Zeit und Sein' ('Time and Being').)

Heidegger, M. (1970a) *Heraklit. Seminar Wintersemester 1966/1967*, Frankfurt: Vittorio Klostermann; trans. C.H. Seibert, *Heraclitus Seminar 1966/67*, Tuscaloosa, AL: University of Alabama Press, 1979.(The text of the seminar Heidegger conducted in tandem with Eugen Fink, 1966-7.)

Heidegger, M. (1970b) *Phänomenologie und Theologie*, Frankfurt: Vittorio Klostermann; trans. J.G. Hart and J.C. Maraldo, *The Piety of Thinking*, Bloomington, IN: Indiana University Press, 1994.(Two essays, dated 1927 and 1964 respectively, on the possible relation between theology and Heidegger's thinking.)

Heidegger, M. (1971) *Schellings Handlung Über das Wesen der menschlichen Freiheit (1809)*, Tübingen: Max Niemeyer; trans. J. Stambaugh, *Schelling's Treatise On the Essence of Human Freedom*, Athens, OH: Ohio University Press, 1985.(The text of Heidegger's lecture course of 1936.)

Heidegger, M. (1972) *Frühe Schriften (Early Writings)*, Frankfurt: Vittorio Klostermann.(This volume reprints most notably Heidegger's Ph.D. dissertation of 1914, and his qualifying dissertation of 1916.)

Heidegger, M. (1976) 'Nur noch ein Gott kann uns retten', *Der Spiegel* 23: 193-219; trans. W.J. Richardson, 'Only a God Can Save Us: The *Spiegel* Interview', in T. Sheehan (ed.) *Heidegger, the Man and the Thinker*, New Brunswick, NJ: Rutgers University/Transaction Publishers, 1981.(In this posthumously published interview Heidegger attempts to explain, among other things, his relation to the Nazi regime in 1933-4.)

Heidegger, M. (1977a) *Vier Seminare (Four Seminars)*, Frankfurt: Vittorio Klostermann; 2nd seminar trans. as 'A Heidegger Seminar on Hegel's *Differenzschrift*', *Southwest Journal of Philosophy* (1980) 11.(The records of four informal seminars that Heidegger conducted with friends and colleagues between 1966 and 1973.)

1 English translations of works in the Collected Edition

Heidegger, M. (1975) *Die Grundprobleme der Phänomenologie*, in *Gesamtausgabe*, vol. 24; trans. A. Hofstadter, *The Basic Problems of Phenomenology*, Bloomington, IN: Indiana University Press, 1982.(Lecture course, summer 1927.)

Heidegger, M. (1977b) *Phänomenologische Interpretation von Kants Kritik der reinen Vernunft*, in *Gesamtausgabe*, vol. 25; trans. P. Emad and K. Maly, *Phenomenological Interpretation of Kant's Critique of Pure Reason*, Bloomington, IN: Indiana University Press, 1997.(Lecture course, winter 1927-8.)

Heidegger, M. (1978) *Metaphysische Angangsründe der Logik*, in *Gesamtausgabe*, vol. 26; trans. M. Heim, *The Metaphysical Foundations of Logik*, Bloomington, IN: Indiana University Press, 1984.(Lecture course, summer 1928.)

Heidegger, M. (1979) *Prolegomena zur Geschichte des Zeitbegriffs*, in *Gesamtausgabe*, vol. 20; trans. T. Kisiel, *History of the Concept of Time: Prologomena*, Bloomington, IN: Indiana University Press, 1985.(Lecture course, summer 1925.)

Heidegger, M. (1980) *Hegels Phänomenologie des Geistes*, in *Gesamtausgabe*, vol. 32; trans. P. Emad and K. Maly, *Hegel's Phenomenology of Spirit*, Bloomington, IN: Indiana University Press, 1988.(Lecture course, winter 1930-1.)

Heidegger, M. (1981) *Aristoteles, Metaphysik 1-3*, in *Gesamtausgabe*, vol. 33; trans. W. Brogan, *Aristotle, Metaphysics 1-3: On the Essence and Actuality of Force*, Bloomington, IN: Indiana University Press, 1996. (Lecture course, summer 1931.)

Heidegger, M. (1982) *Parmenides*, in *Gesamtausgabe*, vol. 54; trans. A. Schuwer and R. Rojcewicz, *Parmenides*, Bloomington, IN: Indiana University Press, 1992.(Lecture course, winter 1942-3.)

Heidegger, M. (1983) *Die Grundbegriffe der Metaphysik. Welt - Endlicheit - Einsamkeit*, in *Gesamtausgabe*, vol. 29/30; trans. W. McNeill and N. Walker, *The Fundamental Concepts of Metaphysics: World, Finitude, Solitude*, Bloomington, IN: Indiana University Press, 1995.(Lecture course, winter 1929-30.)

Heidegger, M. (1984a) *Grundfragen der Philosophie. Ausgewählte 'Probleme' der 'Logik'*, in *Gesamtausgabe*, vol. 45; trans. R. Rojcewicz and A. Schuwer, *Basic Questions of Philosophy: Selected 'Problems' of 'Logic'*, Bloomington, IN: Indiana University Press, 1994.(Lecture course, winter 1937-8.)

Heidegger, M. (1984b) *Hölderlins Hymne 'Der Ister'*, in *Gesamtausgabe*, vol. 53; trans. W. McNeill and J. Davis, *Hölderlin's Hymne 'The Ister'*, Bloomington, IN: Indiana University Press, 1996.(Lecture course, summer 1942)

Heidegger, M. (1989) *Beiträge zur Philosophie (Vom Ereignis)*, in *Gesamtausgabe*, vol. 65; trans. P. Emad and K. Maly, *Contributions to Philosophy: On Ereignis*, Bloomington, IN: Indiana University Press, 1989.(Working notes, 1936-8.)

Heidegger, M. (1991) *Grundbegriffe*, in *Gesamtausgabe*, vol. 51; trans. G.A. Aylesworth, *Basic Concepts*,

Bloomington, IN: Indiana University Press, 1993.(Lecture course, summer 1941.)

Heideggerian philosophy of science

Heidegger's importance in the philosophy of science stems less from his scattered remarks about science than from the larger conception of intentionality and ontology that informs them. Heidegger's earliest major work, Being and Time (1927), displayed everyday practical purposive activity as the most fundamental setting for the disclosure of things in the world. Heidegger claimed that the traditional epistemological conception of a subject who represents objects was derivative from and dependent upon such ongoing everyday practical engagement with one's surroundings. Science was then supposed to be the practice that allows things to show themselves shorn of their significance within the 'in-order-to-for-the-sake-of' structure of everyday activity; nevertheless, the sense of scientific claims remained dependent upon the everyday interactions from which they were abstracted.

Shortly after writing Being and Time, Heidegger revised his project in ways that also transformed his account of science. His overall project shifted from describing the transcendental structure of the meaning of being, to interpreting the 'history of being'. Science was reinterpreted as an activity ('research') closely allied with machine technology, and oriented towards more extensive and intensive manipulation and ordering of things. Understood as such, science for Heidegger was an essential manifestation of the modern age. Whereas, earlier, Heidegger thought that science presupposed a philosophical ontology, Heidegger eventually portrayed science and technology as the conclusion of the philosophical tradition. While philosophical metaphysics and epistemology were thus naturalized, Heidegger was concerned with the possibility of a way of thinking outside this convergence of scientific and philosophical metaphysics.

1 Science in Heidegger's early work

Heidegger followed Edmund Husserl's phenomenology in describing the meaning structures through which beings become manifest or *evident* (see Phenomenological movement §5). His inquiry into the 'meaning of being' accepted Husserl's claim that any intentional directedness also incorporates a 'categorial intuition' of being, as an understanding of what could fulfil that intending. For Husserl, however, perception or intuition was the model for intentional fulfilment (see Husserl, E. §§2-5); Heidegger argued instead that using equipment to realize an end was more basic. This shift had several important consequences. Heidegger argued that equipment is encountered holistically: understanding and using one instrument requires understanding others, and what we encounter foremost in successful practice is an interrelated equipmental setting. Equipment use is also not mediated: one encounters the tool itself rather than a representation of it. Finally, using equipment is socially normative. Equipmental complexes are organized around what one does with them and what they are for, and are governed by the enforcement of norms of correct use. Heidegger argued that the subjects of everyday practice are not individuated knowers, but anonymous, undifferentiated doers of what 'one' does.

The most basic form of intentionality is thus not consciousness but agency. We encounter the world as already organized around available *possibilities* for action that make sense of ourselves and our surroundings. We *interpret* the world and ourselves by enacting some of the possibilities disclosed by understanding the world as a setting for action. For Heidegger, one interprets something most appropriately as, for example, a hammer by hammering with it, not by perceiving it or making assertions; one also thereby interprets nails and boards, oneself as a builder, and one's surroundings as a setting in which hammering makes sense. Heidegger thus takes the 'hermeneutical circle' as a general structure of all meaningful activity, and not just of the interpretation of texts. Intentionality is thus fundamentally temporal: present activity is directed towards a future by working out possibilities made available by having been already 'thrown' into a meaningful situation.

Heidegger portrayed science as a distinctive kind of interpretive engagement with the world. Although science also uses equipment for locally intelligible purposes, he ascribed to these local performances a characteristic end, namely the interpretation of things in the world as 'present-at-hand', shorn of their practical significance. For example, Heidegger suggested that 'mass' acquires its sense as a physical property by gradual abstraction from the practical contexts in which things are 'too heavy' or 'too light'. This changeover from a practical to a theoretical understanding can supposedly be initiated whenever equipment is broken, missing or in the way. What can eventually result is an altogether different sense of what it means to be: beings are understood within a mathematized theoretical framework rather than local contexts of practical activity. Heidegger thought that the

intelligibility of this theoretical projection of nature nevertheless presupposed an understanding of the world as practical setting.

This attempt to understand science as decontextualizing things and overlooking their practical significance confronts serious difficulties. First, Heidegger never convincingly described the *genesis* of this ontological shift. The momentary breaking of practical absorption when things malfunction normally results in re-engagement with the equally practical tasks of repair, replacement or removal. Heidegger does not indicate *how* such practical problem-solving yields to decontextualized theorizing. Moreover, Heidegger does not describe how the practical tasks of science (experiment, instrumental manipulation, theoretical problem-solving and calculation) are connected to the disclosure of things as present-at-hand (see Experiment; Scientific method). Philosophers who emphasize these practical dimensions of science may well find a more adequate account of scientific practice in Heidegger's overall account of everyday practical understanding and interpretation, than in his initial understanding of science as abstracting from practical engagement with local equipmental complexes.

2 Science in later Heidegger

Heidegger's philosophical development in the 1930s had striking consequences for his understanding of science. In that later understanding science ceases to be an intelligible possibility whenever one disengages from practical absorption in the world and frames things theoretically. Instead, science makes sense only within the modern age. Science is not opposed to everyday practice, but rather is taken to manifest more clearly what is happening throughout the modern world. This distinctively modern phenomenon of science is still understood as a theoretical (and ultimately mathematical) projection of nature which permits diverse changing phenomena to be understood as instantiations of necessary unchanging laws. But instead of being accomplished all at once by disengagement from practical absorption in the world, this theoretical projection is itself situated within the ongoing activity of scientific research. Research aims to extend the domain within which facts can be exhibited as regulated by law, by working on and with the laws already articulated. This elucidation of scientific laws both extends their scope and justifies earlier laws by displaying their fruitfulness (see Laws, natural §1).

What is distinctive about modern scientific experimentation for Heidegger is its guidance by and conformity to this theoretical projection of nature as lawful:

> experiment begins with the laying down of a law as a basis. To set up an experiment means to represent or conceive the conditions under which a specific series of motions can be made susceptible of being followed in its necessary progression.
>
> (Heidegger [1952] 1977: 121)

Research and experimentation continually and characteristically open up new possibilities for research. The achievements of scientific research are then adapted as resources for further research. Thus for Heidegger science aims at the continual *expansion* of research as ongoing activity; its continuing successful extension to new domains legitimates its prior achievements.

Heidegger connected the expansion of science's capacities for theoretical calculation with the development of machine technologies. Science does not just use machines to produce, measure and interpret phenomena. Heidegger thought that the *theoretical* framework of modern science projected Nature from the start as calculable and manipulable: ' modern science's way of representing pursues and entraps nature as a calculable coherence of forces' (Heidegger [1954] 1977: 21).

Nature is thus manifest neither as Greek *physis*, nor as independent substances, nor as a significant equipmental complex, but instead as a stockpile of interchangeable resources (for example, of energy, chemicals, genes, labour or population).

Heidegger also connected the development of scientific research and machine technology, and the interpretation of Nature as 'stock', to the metaphysical conception of 'world pictures'. The scientific concern to represent the world objectively requires the right *approach*, so it can show itself unchanged by inquiry. Objectivity thus requires the right method, theories or attitudes, in short, the right kind of *subjectivity*. This shift from correct appearance to correct viewing in turn suggests the possibility of alternative views or pictures of the world. What Heidegger found questionable, however, is the underlying metaphysics of the world as depicted by a subject. Heidegger thought that

understanding ourselves as subjects representing and manipulating objects is not itself a picture to accept or reject, or a position to take up, but a disturbing and questionable historical situation we find ourselves in.

Heidegger's questioning of the metaphysics of the world picture was not intended to develop an alternative metaphysics. Heidegger accepted that naturalized metaphysics and epistemology are the appropriate culmination of the philosophical tradition stemming from classical antiquity. He nevertheless asked whether there might still be a way of thinking apart from scientific or philosophical metaphysics. Such thinking would not determine what there is or what we should do, although he thought it might manifest what is at stake in our situation. Heidegger's remarks about thinking are enigmatic. Many commentators emphasize his association of thinking with the poetry of Hölderlin or the fragments of the pre-Socratics. Others argue that his later thinking attempted to purify transcendental inquiry of any metaphysical implications. On either reading, Heidegger associated such thinking with the possibility of salvation from the nihilism he ascribed to the limitless expansion of scientific and technological control. To realize these possibilities willfully, however, would self-defeatingly try to overcome willfulness. Hence the indirection and apparent quietism of Heidegger's later reflections upon science, technology and the modern world.

3 Contemporary issues in Heideggerian philosophy of science

Heidegger's work encourages attention to the local, circumspective understanding of the world manifest in scientific experiment and instrumental work, without reducing that understanding to explicit theoretical representations. Yet Heidegger also emphasizes the theory-ladeness of science. One possible reading of this latter point suggests continuity with early postpositivist emphases upon theory: all understanding and observation are guided by specific theoretical preconceptions (see Observation). Another reading, not incompatible with the first, highlights a specific presumption within scientific practices, that a calculable order in nature is more fully realizable by an interplay between theoretical modelling and the experimental and technological reconstruction of the world.

Heidegger's work challenges both scientific realism and its empiricist and constructivist critics, by questioning the representationalist conception of scientific knowledge that both presuppose (see Scientific realism and antirealism; Constructivism). Perhaps science and technology are better understood as practical engagement with and intervention in the world, rather than systematic representation of its underlying causal structures or their empirical or social manifestations. To some philosophers this Heideggerian perspective suggests a modest and pluralist realism, for which science accurately describes real causal powers in the world without precluding other true descriptions for different purposes. Others take it to undercut the questions that realism and antirealism alike attempt to answer, and shift attention to the cultural and political significance of scientific engagement with the world.

Heidegger also encourages a new perspective on epistemological naturalism (see Naturalized epistemology; Naturalized philosophy of science). Later Heidegger entertains no doubts of science being understood biologically, psychologically or sociologically; he also accepts that such perspectives offer the best answer to traditional epistemological and metaphysical questions about the sciences. He nevertheless wants to formulate another kind of question that naturalized philosophy of science perhaps cannot address, concerning what is at issue and what is at stake in the historical development of scientific practice.

Heidegger's attempt to move beyond naturalized philosophy of science has encouraged some reconsideration of the relation between the natural and the human sciences (see Unity of science). Heidegger's account of understanding and interpretation rejects traditional hermeneuticist defences of the methodological uniqueness of the human sciences, since he takes the hermeneutical circle to characterize all understanding, and not just the interpretation of texts and human action. Some philosophers, however, have used Heidegger's work to distinguish human science from natural science on different grounds. They draw upon Heidegger's account of human existence (*Dasein*) either to argue for methodological constraints upon adequate interpretations of the meaningful world of human interaction, or to argue that a theoretically stable or predictively successful human science is impossible. Others have argued that such adaptations of Heidegger commit a paralogism: they interpret transcendental conditions upon the possibility of interpretation as objective characteristics of interpreters. If this argument is right, Heidegger's hermeneutics imposes no distinctive methodological constraints upon the human sciences. Heideggerian philosophy of science may then suggest, however, that the significance of scientific

interpretation of nature cannot be disentangled from what is at stake (culturally or politically) in specific historical practices.

The transition in Heidegger's thinking about science contributes to the historicizing of the philosophy of science. His concern is not to display the essential structure of science as a form of knowledge or inquiry, but instead to inquire into the historical emergence and future prospects of a particular set of practices whose goals and achievements are at issue in their ongoing development. Heidegger's account of science thereby contributes to the philosophical discourse of modernity, that is, reflection upon how our 'modern' world differs from its predecessors. In Heidegger's own thinking, this interpretation of science sustained a reactionary anti-modernism. Heidegger's work has nevertheless influenced philosophers who take quite different philosophical and political stances toward characteristic features of the modern world.

The connection between Heidegger's reflection upon science and his criticisms of modernity nevertheless raise disturbing questions about the relation between philosophy and political life. The shift in Heidegger's thinking which identified science and technology as essential phenomena of the modern age coincided with his overt identification with National Socialism in Germany in the 1930s. Heidegger's influence upon subsequent philosophy of science can certainly be detached from his personal philosophical allegiance to the Nazis even if his own philosophical project cannot. What cannot be so readily set aside, even today, is the urgency of critical reflection upon the political uses of philosophical work and the dangers as well as hopes attached to politically engaged philosophical reflection upon the modern world.

Heisenberg, Werner (1901-76)

One of the most outstanding of twentieth-century physicists, Werner Heisenberg is famous for the uncertainty, or indeterminacy, principle of quantum mechanics, widely interpreted as implying an irreducibly indeterministic conception of nature. The main proponent of the Copenhagen interpretation after Bohr, Heisenberg conceived of the quantum description as referring not to objective spacetime realities, but merely to the probable outcomes of measurements. Heisenberg's philosophy, containing contradictory positivistic and realistic strands, is best understood in the context of his creative scientific theorizing.

In 1925 Heisenberg developed the foundations for quantum mechanics, proclaiming that a consistent atomic theory should contain only relations between experimentally observable quantities. Heisenberg replaced such 'unobservables' as electrons' positions by an ordered set of data related to the 'directly observable' frequencies and intensities of emitted radiation. An analysis of Heisenberg's work reveals that he used this positivistic principle not as a heuristic guide, but as an a posteriori justification of the successful technical method that *de facto* eliminated electronic positions. Heisenberg's approach, rather than being positivist, is akin to what he defined as 'practical realism'. A 'practical realist' does not resign from the quest for the underlying reality, yet dispenses with those realistic notions which cease to be theoretically fruitful.

In 1927, in an attempt to provide an 'intuitive' interpretation of the abstract quantum formalism, Heisenberg reversed his opinion about the unobservability of electrons' positions. By declaring that the meaning of concepts is identical with the procedure of their measurement, Heisenberg demonstrated agreement between the operational definition of spacetime concepts in thought experiments and the mathematically derived uncertainty formulas. Heisenberg concluded that the precise simultaneous specification of canonically conjugate variables, such as positions and momenta, is impossible in principle. Rather, they are subject to uncertainty relations: $\Delta p \Delta q \sim h$, where Δp, Δq are indeterminacies in the position and momentum measurements, and *h* is Planck's constant. A similar relation, $\Delta E \Delta t \sim h$, holds between energy and time. These formulas imply that in the atomic domain, as opposed to the classical one, the spacetime and energy-momentum descriptions are mutually exclusive, or 'complementary'.

Heisenberg's operational approach in the deduction of the uncertainty principle is often interpreted as a direct continuation of his earlier positivistic stand. Yet we witness here a fruitful epistemological about-face: if in 1925 the directly observable data determined the structure of the theory, in 1927 the theory dictated the possibilities of observation. In 1925 Heisenberg eliminated classical spacetime concepts; in 1927 he resurrected them, restricting their simultaneous applicability. In both cases Heisenberg aimed to secure the acceptance of an unconventional and abstract theory. This strategy of persuasion, which elevated local epistemological moves into overarching principles of knowledge, is a source of confusion in interpretations of Heisenberg's philosophy.

Heisenberg explored the philosophical implications of the uncertainty principle in relation to two central issues: 'indeterminism' and 'objective reality'. Heisenberg declared that the uncertainty principle, necessarily introducing probability into the definition of a system's state, implies a conclusive renunciation of causality. In principle, we cannot know the present with enough precision in order to predict the future with certainty.

Heisenberg's initial explorations of uncertainty contain ambiguities. He did not make clear whether uncertainty signified an epistemological limitation on measurability, or is of an ontological nature - the later Copenhagen stand. Heisenberg did not carefully distinguish between acausality and indeterminism (see Determinism and indeterminism §2), nor did he provide cogent reasons why the uncertainty principle necessarily applies to an individual system, rather than to the statistics of an ensemble of similar systems - a less radical interpretive option.

Another implication of uncertainty concerns the physicist's notion of reality. The probability function does not describe what happens between observations in classical visualizable terms. The physical description, Heisenberg maintained, is no longer about the objective course of nature. Rather than describing 'nature in itself', physicists only specify nature's responses to questions put in experimental set-ups.

Despite positivistic overtones, Heisenberg's position is not identical with Bohr's prohibitions on inquiring about

the reality ‘behind the phenomena’ (see Bohr, N.). Heisenberg describes his position as a neo-Platonic one, which identifies genuine reality with the underlying mathematical forms. Heisenberg’s position that the ‘primal’ reality is mental is revealed by his introduction of a conscious observer into physical description. According to Heisenberg, it is the experiment that ’forces’ an atom to indicate a definite property. While the transition from the ‘possible’ to the ‘actual’ occurs during measurements, the discontinuous change in the system’s probability function takes place only when a conscious observer registers measurement results (see Quantum measurement problem).

Even though Heisenberg and Bohr often presented a united front against the opponents of the Copenhagen interpretation, they differed on many crucial issues. Their disagreement about Bohr’s doctrine of the indispensability of classical concepts - the heart of complementarity philosophy - is a most notable example. Contrary to Bohr, Heisenberg did not believe that a consistent interpretation of the microdomain is possible by using only classical concepts, without recourse to the quantum formalism. Heisenberg’s endorsement of Bohr’s arguments alongside his own dissenting views, resulted in numerous contradictions in Heisenberg’s philosophical writings.

Heisenberg’s philosophy was not formed in an attempt to erect a consistent structure. It was developed in numerous talks to different audiences in changing sociopolitical circumstances. Brilliant and intellectually fearless, Heisenberg was not constrained by logical inconsistencies. Pauli, Heisenberg’s closest collaborator, criticized Heisenberg at the beginning of his scientific career for being ‘very unphilosophical’ (Hermann *et al.* 1979). Many years later, Pauli singled out Heisenberg’s philosophical opportunism as a major source of his astounding scientific creativity.

Hell

The ancient idea that the dead go to a dark subterranean place gradually evolved into the notion of divinely instituted separate postmortem destinies for the wicked and the righteous. If the former lies behind the Psalms, the latter version appears in apocalyptic works, both canonical and deutero- or non-canonical, and is presupposed by numerous passages in the New Testament. Through the patristic and medieval periods the doctrine gradually achieved ecclesiastical definition, stipulating eternal torment (both physical and spiritual) in a distinctive place for those who die in a state of mortal sin. Most reformers recognized biblical authority for this doctrine. Philosophically, the notion of postmortem survival raises many questions in the philosophy of mind about personal identity. Recent discussion, however, has concentrated on the specialized version of the problem of evil to which the doctrine gives rise.

1 The problem of hell

The doctrine of hell gives rise to a specialized version of the problem of evil because it can be argued that the propositions:

(I) God exists and is essentially omnipotent, omniscient and perfectly good; and
(II) some created persons will be consigned to hell forever,

are logically incompossible, as follows:

(1) if God existed and were omnipotent, he would be able to avoid (II);
(2) if God existed and were omniscient, he would know how to avoid (II);
(3) if God existed and were perfectly good, he would want to avoid (II);
(4) therefore if (I), not (II).

Premise (1) seems obvious because an omnipotent creator could falsify (II) either by altogether refraining from making persons, or by annihilating created persons any time he chose. Further, some traditional theologians (for example, Augustine, Duns Scotus, William of Ockham and Calvin) take divine sovereignty over creation - both nature and soteriology - to imply divine freedom with respect to soteriological policy. For example, God could have legislated annihilation at death for human persons, or temporary purgatory followed by everlasting utopia for all sinners. Premise (2) follows because an omniscient God would know the scope of his powers. Premise (3) rests on the twin intuitions that a perfectly good God would want to be good to any persons he created, whereas hell means decisive ruin for its inhabitants.

The most straightforward solution is to reject either (I) or (II). The problem is that each is deeply entrenched in Christian belief. The Bible represents Christ as teaching that the disobedient and unfaithful will be ‘cast into outer darkness’, where there is ‘weeping and gnashing of teeth’ (Matthew 13: 42, 50; 22: 13), or thrown into the ‘unquenchable fire’ that is ‘prepared for the devil and all his angels’ (Matthew 13: 42, 50; 18: 8-9; 22: 13; see also 3: 10). If faith in Christ implies a belief that the teachings of Christ are true, then such texts seem *prima facie* to commit Christians to (II). Hermeneutical ingenuity will be required to reject (II) without eroding the epistemological foundation for faith in Christ itself. A minority of universalists (who believe that everyone will be saved) and annihilationists (who hold that the wicked will be annihilated at death or after a finite period of postmortem suffering) have shouldered that burden and declared (II) false.

2 Varieties of goodness

The argument in (1)-(4) above will convict Christians of contradiction, however, only if they understand the attribute terms and the doctrine of hell in something like the above-mentioned ways. In fact, Scripture and tradition contain a range of interpretations of divine goodness (see Goodness, perfect §3) and specify a variety of reasons why God might not falsify (II).

Global approaches. Some say that divine goodness finds its expression in the world as a whole, that universal republic for the good of which the wellbeing of individuals may be sacrificed. Thus, some medieval and Reformation theologians affirm that - whether because of the ontological incommensurability of the infinite

relative to the finite, or because God is creator and governor of all else - God has no obligations to creatures and so cannot be deemed to be unjust to them, no matter what he does. Whether in fact or by natural necessity, God orders the world as a whole to advertise his goodness and manifest his glory. Given the Fall, Aquinas explains, God predestines some to show his mercy and damns others to declare his justice. It is certainly epistemically possible that a maximally perfect ordering of the world as a whole should include hell for some created persons.

Metaphysical goodness. Christian Platonist that he is, Augustine assumes that to be is to be good, because it is either to be God (who is goodness itself) or to be somehow God-like. He concludes not only that God is good to any creature simply by conferring the gift of existence, along with other natural endowments, but also (in apparent contradiction of Matthew 26: 24) that the value of such goods to their created possessor trumps any disvalue constituted by deprivations of its wellbeing. Thus, even the damned in hell have reason to give thanks and praise to God!

Conditional goodness to created persons. More intuitive, because more concrete, is the notion that divine goodness to created persons involves God's guaranteeing to each that their life is a great good to them on the whole and in the end. Yet many defenders of the doctrine of hell (Swinburne 1983; Stump 1986; Craig 1989; Walls 1992) insist that taking created freedom seriously forces the qualification 'except through some fault of their own' - which is enough to falsify (3) in the argument in §1.

3 Free-will defences of hell

Since much biblical talk of heaven and hell functions to make ante-mortem created free choices seem momentous, many defend the logical compossibility of (I) and (II) on the basis of the following assumptions:

(A1) created free will is a very great good, whether intrinsically or as a necessary means to God's central purposes in creation;
(A2) God cannot fulfil his purposes for and with free creatures without accepting the possibility that (II) some will qualify for damnation.

(A1) is variously explained in terms of alleged divine desires to confer on created persons the dignity of self-determination with respect to their own (eternal) destinies, or to enter into mutual relations of beatific intimacy with created persons in which their 'yes' to God is their own. (A2) rests on multiple philosophically controversial assumptions. First, it presupposes that created freedom is incompatible with divine determinism; otherwise God could avoid damning creatures simply by causing them to make choices that qualify them for heaven. Second, even granting libertarian or incompatibilist freedom, (A2) holds only if either God lacks middle knowledge (see Providence §3) of what free creatures would do in which circumstances prior in the order of explanation to the divine decision to actualize them in those or other circumstances, or it is logically possible that some creatures are 'transworld damned', in the sense that no matter what circumstances God actualized them in, and no matter what helps of grace compossible with their freedom God furnished, their choices would qualify them for damnation. For if God had such middle knowledge and no creatures suffered from transworld damnation, God could falsify (II) by solving the coordination problem and actualizing created persons only in those circumstances in which none would qualify for hell. Suárez (§1), who is an advocate of divine middle knowledge, affirms the necessity of divine resourcefulness - necessarily, for any possible person and any situation in which it can exist, there are some helps of grace that would (should God supply them) win the creature over without compromising its incompatibilist freedom - and so would pronounce transworld damnation impossible and (A2) false.

Third, (A2) assumes that, given sufficiently sinful exercise of created freedom, God does not have the option of waiving the consequence of damnation. For if (as Duns Scotus and William of Ockham suppose) worthiness of damnation were a statutory policy created by free and contingent divine legislation, it would be within God's power to spare all incompatibilist-free creatures no matter what they did. Even if hell were understood not as external and arbitrarily contrived punishment, but as the intrinsic and natural consequence of ante-mortem sinful choices, divine omnipotence would be as able miraculously to obstruct them as to prevent fire from burning the three young men in the furnace (Daniel 3: 13-20). To defend the impossibility claim in (A2), one would have to maintain that God necessarily owes it to himself to punish such sinners in one of those ways. Otherwise additional reasons will be required to explain God's free and contingent choice.

Contemporary free-will defenders of the doctrine of hell (notably Swinburne, Stump, Craig and Walls) meet this demand by reasserting (A1), the intrinsic value of created freedom and/or the importance of its unfettered exercise to God's purposes. Postmortem miracles transforming the sinner's character to make beatific intimacy with God possible and desirable would rob the creature of the dignity of self-determination with respect to its relationships and destiny. Although the creature would remain metaphysically the same person, the miraculous disruption would produce such discontinuities that it would be difficult for the post-conversion self to identify with the projects and purposes of the ante-mortem character. God pays his respects to created personality precisely by not effecting such miraculous changes, but regretfully giving the creature over to the consequences of its choices and allowing it to remain the person it has become.

By contrast, medieval theologians refused to hold God to a postmortem non-interference policy. They reasoned that if rational creatures were as free to accept or reject God after death as before, the blessed might fall again and the damned might repent. To prevent both, God was said to confirm them in their choices by making it causally impossible for them to deviate from their 'deathbed' orientations. With the elect, the value of divine interference was glossed in terms of a traditional equivocation which saw freedom on the one hand as a self-determining power for opposites, and on the other as an orientation towards intrinsic value for its own sake (see Anselm of Canterbury §6). Ante-mortem careers in which created freedom imitated God with respect to self-determination were brought to rest in a higher freedom that mimicked God's stable orientation to the good. Applying - as they did not - their estimate of the value of libertarian freedom to the fate of the damned, it might seem that if hell is bad enough, the failed effort 'to do it oneself' - like a child's attempt to put a toy aeroplane together - might come to rest in assisted success. Moreover, the transformation could be gradual, carefully engineered by God to approximate the continuity with difference found in dramatic ante-mortem conversions.

Whether divine non-interference constitutes respect for created agency depends on the strength of human agency and the perniciousness of hell. Toning down vivid biblical imagery, some (notably Swinburne and Stump) contend that hell does not rob life of all positive meaning because abandonment to the natural consequences of ante-mortem choices is compatible with many and diverse satisfactions - some perverse (for example, rebellion for its own sake) and all minuscule (for example, debating with Milton's fallen angels the compossibility of divine foreknowledge and created free will) in comparison to the joys of divine company. Others (for example M.M. Adams) reason that since humans were made to find ultimate satisfaction in God, persistent turning away from God, cemented in vice, will eventually unravel the personality into madness, the pain of which is only faintly anticipated by ante-mortem schizophrenia and depression. Could God really respect our dignity by standing idle while we degrade ourselves? Yet if God intervenes to put a floor under our fall, why not to turn us - by a continuity-preserving process - to himself?

A sober look at the reality of human life raises the question whether the vast majority of human beings were ever up to the challenge of deciding their own eternal destinies, of taking it upon themselves to give a final 'yes' or 'no' to God. Humans begin life ignorant, weak and helpless, psychologically so lacking in self-concept as to be incapable of choice. We learn to 'construct' a picture of the world, ourselves and other people only with difficulty over a long period of time and under the extensive influence of non-ideal choosers. We emerge from the long, messy developmental process with entrenched neuroses that colour our cognitive as well as affective 'takes' on the world and thus impair our freedom, while we unconsciously 'act out' doing harm to self and others. Our grasp of hell's grim torments, as of heaven's bliss, is radically inadequate. Even if we could experience either for a short time (for example, burning fire, deep depression, consuming hatred; St Teresa's joyful glimpse of the Godhead), we are unavoidably unable to experience their cumulative effect in advance, and so unable more than superficially to appreciate what is involved in either. The apparent conclusion is that human agents are unavoidably unable to exercise their free choice with fully open eyes, the way free-will defenders sometimes suggest.

The evaluation of ante-mortem human agency is something about which Christians have disagreed for centuries. What may be the majority report tries to reconcile empirical realities with its free-will defence of the doctrine of hell by appealing to the doctrine of Adam's Fall. Adam and Eve, the primordial human couple, had the robust agency required to make the momentous choice. Our damaged agency is an inherited consequence of their sin (see Sin §2). Nevertheless, whether because of a doctrine of collective responsibility (according to which it is just that all members of a family participate in the punitive consequences and/or the guilt of the deeds of its head) or because the damages are alleged not to be disabling, such impairments do not excuse us from the task or the

consequences of making our own momentous decision.

4 Pragmatic arguments

Closely coupled with free-will defences of the doctrine of hell is the pragmatic or moral argument that the threat of hell is a powerful incentive to religious fidelity and moral diligence. Kantians, who may themselves believe in some sort of postmortem retribution, counter that the motive of punishment avoidance undercuts the moral enterprise, which enjoins duty for duty's sake. Moralists of other stripes allow threats a place in the early stages of moral pedagogy or grant moral legitimacy to the self-concerned desire to be rightly related to God, the good, the moral law, and so on. Still others charge that pragmatic arguments cut both ways: the notion that the governor of the universe will consign sinners to the eternal consequences of their choices might just as easily produce rebellion (as, for example, in the case of J.S. Mill), or combine with a pessimistic appraisal of human nature to foster despair!

5 Alternative destinies

While many take biblical apocalyptic language at face value, others see the rhetorical context of exhortation and poetic imagery as opening hermeneutical loopholes that leave the fate of persistent sinners scripturally underdetermined. Positions can be seen to vary along the following five dimensions: the degree of divine initiative involved in setting up and consigning people to hell; whether death is the 'deadline' at which qualifications are assessed, or whether there is a temporary or indefinite period of postmortem opportunity; the duration of hell - whether it begins immediately after death or only after the Last Judgment, and whether it lasts forever or whether souls consigned there eventually wither away; whether the suffering is psychospiritual only or also physical; and whether the fate is irreversible.

Hellenistic medical epistemology

During the Hellenistic period (323-31 BC), there arose, largely in Alexandria, a profound debate in medical methodology. The main participants were the Empiricists, committed to an anti-theoretical, practical medicine based on observation and experience and the various Rationalists, such as Herophilus, Erasistratus, and Asclepiades, who held that general theories of physiology and pathology were both attainable and essential to proper medical understanding and practice. Dispute about the nature of scientific inference and the status of causal explanation mirrored and to some extent conditioned the contemporary debate between Stoics and sceptics about epistemology.

1 Rationalists and Empiricists

In the medicine of the post-Classical period, the empiricism already discernible among the Hippocratic doctors (see Hippocratic medicine) gathers strength. Diocles of Carystus (*fl. c.*350 BC) denied that explanation was in all cases possible or even desirable; some things simply have to be accepted as though they were first principles, while experience is the best guide to therapy. The main function of theoretical explanations (in terms of the balance of humours, or whatever) is simply to convince the patient of the doctor's competence.

This empirical approach was taken up by Herophilus (*fl. c.*260 BC), who held that 'the appearances should be stated first even if they are not first' (fr. 50a), and that causes should be accepted 'only hypothetically' (fr. 58). He devised a set of dilemmatic arguments against the existence of causes (fr. 59), for example: causes must be either (a) corporeal of corporeal effects; (b) incorporeal of incorporeal effects; (c) corporeal of incorporeal effects; or (d) incorporeal of corporeal effects; but none of (a)-(d) is possible; hence there are no causes. He performed dissections and vivisections (perhaps even on human subjects: frs 63-74), discovering the distinction between motor and sensory nerves, and described four basic 'powers' responsible for human physiological functioning (frs 131, 184).

His contemporary, Erasistratus, another brilliant anatomist, doubted whether so-called antecedent causes (such as the excessive exposure to sunlight which presages fever) were properly causes at all, since they are not invariably followed by their supposed effects (a view countered by Galen (§3). While paying lip-service to teleology, he developed a severely mechanistic physiology, rejecting specific organic 'faculties' (for example, of attraction for urine by the bladder) to explain particular functions, in favour of a fluid dynamics based on the principle of *horror vacui* (see Strato §3).

Philinus (*fl. c.*250 BC) and Serapion (*fl. c.*225 BC), a pupil of Herophilus, adopted this cautious, empirical attitude and gave it a full-bloodedly sceptical twist, founding the school of medical Empiricism, the fullest account of which is given in Galen's *Outline of Empiricism*. They held that all theoretical knowledge (of the micro-structures of the body, and of causal powers) was unattainable, and in any case unnecessary for successful medical practice, which required only the accumulation of large amounts of empirical data of regular connections between phenomenally observable types of events, in regard both to the prognosis of the course of a disease and its therapy (*Outline of Empiricism* 2). Such evidence was to be gained primarily by personal observation, supplemented by second-hand reports whose reliability was itself subject to empirical testing (*Outline of Empiricism* 3, 8).

Possible remedies might be suggested by inspiration or luck, or the observation of a fortuitously therapeutic set of circumstances (*Outline of Empiricism* 2). Such initially successful therapies must then be subjected to further empirical testing, for 'experience' (a suitably large set of such congruent concatenations) to produce a 'theorem' (an empirically-based therapeutic generalization, for example, 'pomegranates cure diarrhoea'). A third, controversial, feature of their method was 'transition to the similar', a form of analogical reasoning which some of the Empiricists allowed to suggest therapies for hitherto unobserved conditions (*Outline of Empiricism* 4): thus, confronted with an unprecedented ankle-ailment, noting that ankles resemble wrists, one might apply some previously tested wrist-remedy.

The status and applicability of transition was much disputed. It was not emphasized by the earliest Empiricists, and their successors disagreed as to whether it was a proper part of medical practice (hence requiring theoretical justification), or whether doctors simply found themselves using it (*Outline of Empiricism* 4). Some later

Empiricists, notably Cassius 'the Sceptic', refused to allow transition any role at all, and tried to re-establish Empiricism in its original pristine form, unsullied by any such Rationalist accretions.

'Rationalist' here is an umbrella-term for anyone committed to any theoretical physiology and pathology; thus Herophilus, Erasistratus, the Pneumatists (who held that the condition of the *pneuma*, modified inspired air (see Pneuma), was fundamental to health and disease), and the followers of Asclepiades (second century BC), who held that disease was caused 'by the lodgement of theoretical particles in the theoretical pores' (Sextus Empiricus, *Against the Professors* VIII 220) and developed a theory of the internal fluid dynamics of the body on the basis of the principle of 'movement towards the rarefied' (compare Erasistratus' *horror vacui*), are all Rationalists. However disparate their views, they all believed in the possibility of inferring from surface phenomena to the underlying structural reality of things, by a process known as *analogismos*. By contrast, the Empiricists restrict themselves to *epilogismos*, inference from one evident phenomenon to another with which it is regularly associated (*Against the Professors* VIII 7; compare Sceptic and dogmatist on signs: see Pyrrhonism §4).

Galen wrote an early treatise *On Medical Experience* presenting the anti-Empiricist arguments of Asclepiades and the replies of Menodotus (*fl. c.* AD 150), the most sophisticated Empiricist of his day. Asclepiades argues that Empiricists cannot avoid theoretical commitment: their syndromes are supposed to consist of concatenations of phenomena that have been observed to occur similarly in many cases. But what is similarity? Everything both resembles and is distinct from everything else in innumerable ways. What is required is some concept of *relevant* similarity: but that is already a theoretically-laden notion (*On Medical Experience* 4-6). Moreover, how many cases are enough? The Rationalist deploys a Sorites argument (see Vagueness §2) to undermine the coherence of such a concept (*On Medical Experience* 7).

Both charges are answered. First, the Empiricist requires no *theory* of relevant similarity; he is simply guided by the way things appear. He need not say *why* things appear to be alike - they just do. And experience itself shows that this is the way to acquire practical abilities (*On Medical Experience* 9-11). Moreover, although the Rationalists claim to be able to infer from the phenomena to the hidden natures of things, they disagree radically among themselves as to what those natures are - and these disagreements are, by their very nature, undecidable (*On Medical Experience* 12-13). Finally, there is no determinate answer to the question how many cases are enough: that varies from case to case, doctor to doctor. If serious, the Sorites is quite general and will destroy the coherence of innumerable everyday concepts (*On Medical Experience* 16-17, 21). But this is of no concern to the Empiricist, who has no time for such theoretical niceties.

2 Methodists

In the first century AD there arose a third medical sect, that of the Methodists. They held that all disease was reducible to either excessive constriction or excessive dilation of the pores of the body, or to some combination of these conditions. These 'communalities' are directly evident to suitably-trained observation, and require no theoretical inferences. Thus the Methodists agreed with the Empiricists in eschewing theory, but parted company with them over the issue of causes. Rationalists were united by the belief that proper physiology and pathology (and hence proper therapy) demanded a theoretical understanding of the hidden causal mechanisms of nature. Empiricists rejected such speculation about the hidden structure of things as being both inherently ungroundable and therapeutically useless, but were prepared to allow into their syndromes reference to items which the Rationalists at least would describe as antecedent, evident causes. Methodists rejected even appeal to antecedent causes, holding that all that mattered was the current condition of the patient's body, a condition whose aetiology was quite irrelevant.

Hellenistic philosophy

The Hellenistic schools dominated the Greco-Roman world from c.*300* BC *to the mid first century* BC*, making it an era of great philosophical brilliance. The principal doctrinal philosophies were Stoicism and Epicureanism, but this was also the age in which scepticism emerged as a philosophical movement. The central issues of debate were the nature and origin of the world, the means to attaining truth and the ethical goal.*

The Hellenistic age is defined negatively, as the interregnum between two empires. It starts with the death of Alexander the Great in 323 BC and the collapse of his empire, and ends with the battle of Actium in 31 BC, the official start of the Roman Empire. Its main positive feature is the ‘Hellenization’ of - that is, the spread of Greek culture to - much of the Mediterranean world, especially the East. A high proportion of the converts to the Hellenistic philosophical schools flocked to Athens from the cities of western Asia, and a sense of excitement about Greek culture was one factor in the emergence of new philosophical schools. A favoured alternative explanation is that the collapse of the old Greek *polis*, or city state, had left people feeling lost and in need of philosophical succour, but it is doubtful whether that hypothesis, even if sustainable, could account for more than a fraction of the new converts.

Although Alexandria eclipsed it as a centre of learning, Athens remained the headquarters of philosophy almost throughout the era. Hence in many ways Hellenistic philosophy would better be dated from 306 BC, when Epicurus founded his school in Athens, to 88 BC, when the Athenian schools were badly weakened in war, never fully to recover their institutional supremacy. The succeeding era was marked by a philosophical diaspora throughout the Roman Empire.

A Hellenistic doctrinal philosophy was a complete system, which had to offer: (1) an understanding of the world’s origins, components and organization, and of our place in it; (2) a methodology of discovery, which included in particular naming one or more ‘criteria of truth’; (3) an account of what the ‘goal’, happiness (see Eudaimonia), consists in. These three areas correspond to what had become the standard tripartition of philosophy into (1) physics, (2) logic and (3) ethics.

The main two doctrinal Hellenistic philosophies can be studied in the entries on Epicureanism and Stoicism. The sceptical philosophers of the New Academy constituted a third main movement, which provided constant critiques of its doctrinal rivals (see Arcesilaus; Carneades). Pyrrhonist Scepticism made a brief appearance at the beginning of the era (see Pyrrho; Timon), but did not become a formal movement until its refoundation by Aenesidemus towards the end of it (see Aenesidemus; Pyrrhonism). Nevertheless, Pyrrhonism is commonly counted as a Hellenistic philosophy.

‘Hellenistic’ is in any case not a purely chronological label. Aristotelianism survived in some form throughout the period (see Theophrastus; Strato; Peripatetics), but did not really become distinctively Hellenistic. The philosophy of the period is sometimes called *post*-Aristotelian. However, although Aristotle did happen to die within a year of Alexander the Great, this label is misleading: it is unclear how far the philosophers of the period recognized Aristotle as a major philosopher to whom they were obliged to respond. Aristotle’s real revival occurred only at the very end of the Hellenistic age.

On the other hand, the main spokesman of Pyrrhonism today is Sextus Empiricus, who is often therefore treated as a Hellenistic thinker, despite his probable date in the second century AD. Likewise, Stoics of the first two centuries AD are commonly thought of as Hellenistic (see Seneca; Musonius Rufus; Epictetus; Marcus Aurelius).

Plato remained a philosophical influence throughout the era, but there was no genuine doctrinal Platonism between *c*.265 and *c*.50 BC. In the early first century BC Antiochus advertised a return to Platonism, but his philosophy is in fact characteristically Hellenistic in its terminology and concepts.

Apart from some short writings of Epicurus, no Hellenistic philosophical treatises have survived intact. It has been the task of modern scholarship to reconstruct the systems and debates from secondary sources. The most important of these are the Latin philosophical dialogues of Cicero, and the third-century AD *Lives of the Philosophers* by Diogenes Laertius.

Helmholtz, Hermann von (1821-94)

In physiology, physics, mathematics, aesthetic theory and epistemology, Helmholtz intervened, and innovated. He contributed to the physiology of perception through work on the central nervous system, followed by work on optics and acoustics. He invented instruments, such as the opthalmoscope and introduced the mathematical principle of the conservation of energy to physics. For geometry, Helmholtz elaborated on the concept of an n*-dimensional manifold. He secured the influence of the 'Berlin physics', introduced Faraday and Maxwell to Germany, refined the theory of electrodynamics and reflected on the role of discrete entities in physics. Having become the most influential representative of German science and its uncontested spokesperson, he repeated the importance of the connection between education and research and the necessity not to separate the natural sciences (*Naturwissenschaften*) from the social sciences (*Geisteswissenschaften*). This monumental body of work is experiencing a revival of interest today as historians of both science and culture consider it in a new light. But the question remains of how to characterize what we might call 'the Helmholtz effect'* in philosophy. *Why was Helmholtz equally influential not only on Cassirer, Husserl, Schlick, Meyerson and Freud, but also on the principal founders of contemporary physics; Einstein, Bohr and Heisenberg? To grasp this, we must understand the constant interaction between science and philosophy which characterized, even permitted, the extraordinary developments in mathematics, physics and physiology in Germany at that time. Here the connection between Helmholtz and Kant is fundamental, since 'the Helmholtz effect' transformed the Kantian heritage. Helmholtz did not write a systematic philosophical work, but in redefining fundamental epistemological concepts and constructing a large part of the conceptual structure in which both philosophy and relativistic and quantum physics developed during the early twentieth century, he modified the very problems of epistemology.*

1 Epistemology after Kant

In its usual nineteenth-century German, philosophical sense, the term epistemology (*Erkenntnistheorie*) designates the theory of knowledge or cognition with a view to the determination of objectifying acts: how can the subject transform *phenomena*, which are given to it, into *objects* of cognition? In this sense epistemology, in the nineteenth century, appeared less as a particular doctrine, as it had been for Immanuel Kant, than as a problem: the problem of 'objectification', which the Kantian critique had recast at the centre of a philosophy founded on the concept of *Vorstellung* (representation). Epistemology was, as Harald Höffding repeated in 1925, the most exact part of philosophy, in contrast with the diverse forms of *Lebensphilosophie* (philosophy of life). But it was, for the followers of Kant, something not only to be repeated (against the idealism of Hegel or Schelling) but also something to be adapted (to the advancement of knowledge) and modified.

Helmholtz clearly indicated that the aim of all his work had been to elaborate a general conception of representation which would permit him to establish 'the sources and the degree of legitimacy of our cognitions', adding that no area of learning could ignore this question with impunity. The *Handbuch der physiologischen Optik (Treatise on Physiological Optics)* (1856, 1860, 1867) already stemmed from his ambition to develop the Kantian transcendental aesthetic in the domain of the natural sciences. The famous lecture of 1878, Die Tatsachen in der Wahrnehmung (Facts in Perception) made clear that the basic problem of the natural sciences is the same as that of epistemology: the problem of knowing in what sense our representations correspond to *das Wirkliche* (the actual real; that is to say, for Kant, that which accords with the material conditions of experience). And in the preface to the 1884 edition of his *Vorträge und Reden (Lectures and Talks)*, Helmholtz wrote: ' I was a committed Kantian at the beginning of my career and I still am'. To understand where our representations come from and how they are organized, Helmholtz wanted to continue Kant's work. But, in so doing, he radically transformed Kantianism.

2 Sensation/intuition, categories, schema/symbol: redefinitions

Perhaps nothing is more difficult to grasp in the history of philosophy than the operation which consists of preserving a problematic while displacing its centre (or its scaffolding), and of changing the concepts of a language without changing its words. It is exactly this operation which defines 'the Helmholtz effect'. To understand this, we will rely upon the internal architecture of Kantian critique by noting the three questions that Helmholtz found in it.

The first question concerns the apprehension of phenomena. How is that which is given in phenomenal

manifestations given to us? Kant had answered this question by distinguishing purely subjective conscious *Empfindung* (perception) from objectively conscious perception or intuition, and by defining pure intuition as the combination of two a priori forms of sensibility (which are thus anterior to all experience): space, the form of external intuitions, and time, the form of internal intuitions. Kant wished, above all, to limit dogmatic metaphysics and to do away with onto-theology; he did not aim to provide the foundation for a psychology and was thus uninterested in analysing sensations. Furthermore, he seemed to assume that the basic constitution of spatiality was correctly described by the axioms of Euclidean geometry; in this sense, whenever a phenomenon is given to us, it is on condition of its localization in ordinary space and time (see Kant, I. §5).

Now, by returning to the questions of sensation and intuition, Helmholtz was first led to recognize the existence of a process of objectification at the level of perception, and then radically to enlarge the concept of intuition. First, with regard to the 'analysis of sensations', until then overshadowed by the transcendental aesthetic, Helmholtz (following his first professor of physiology, J. Müller) showed that sensations are not reflections of real, objective properties of things, but depend essentially on the appropriate sensory receptor, the field of perception, and so on. Extended objects in space only appear to us, in reality, as 'enveloped' in sensations produced by our nervous system. In sensation, there is no relation of resemblance with things, but rather a construction of signs (for example, in depth perception). Correspondence with the external world becomes a matter of *learning* by accumulating 'unconscious inferences'. Second, concerning space and time, Helmholtz showed that what is at issue again are progressively constructed forms of experience. Proposing a new type of empiricism in philosophy of mathematics, he links the structure of spatial intuition to the experience of the free mobility of rigid bodies (this idea of the kinaesthetic constitution of the concept of space was taken up by Edmund Husserl) and he anchors the structure of temporal intuition in that of counting and in the concept of ordinal numbers. From that moment on, the forms of sensibility cease to be a priori, while Euclidean geometry and the axioms of arithmetic lose their transcendental status. Conversely, the concept of intuition must be expanded: for the construction of intuition, it suffices that the impressions of the senses, which may correspond to any mode of observation (including the imaginary), be specified in a determinate and nonambiguous manner. This expanded intuition, which Helmholtz sees as the basis of non-Euclidean geometries, paves the way for Husserlian 'categorial intuition'. In addition, we should note that, for their part, Niels Bohr and Werner Heisenberg adopt the redefinition literally when they come to describe the 'intuitive character' of the new quantum mechanics. In every case, we thus see in Helmholtz a radical displacement of Kantian concepts. For Kant, intuition was an immediate and a priori presentation of phenomena and a specification of the general concept of *Vorstellung* (representation). For Helmholtz, representations become modes of *acquired* presentation, through unconscious inferences (sensations) and systematic work (symbolic languages) at the same time. In addition, intuition, broadly conceived, appears as *interpretation*, which depends simultaneously on the natural environment, the subject's history, the historical condition of languages and forms of thought, and so on.

We can easily see how Helmholtz will transform the second question he takes from Kant: that of the pure concepts of the understanding, the Categories. For Kant, the basic cognitive process is objectification, and objectification takes place by subsuming our intuitions of phenomena under pure (a priori) concepts. The list of these concepts is closed and ahistoric, for the simple fact that it is derived, at least in principle, from general logic. In scientific cognition, the principles of causality (*Ursache und Wirkung*), of the permanence of substance and of reciprocal action are thus the constitutive principles which allow the transformation of phenomena into objects (see Kant, I. §6). Without going into the details, we can say that Helmholtz imposes upon these principles an essential limitation, while interpreting them as simple, *invariant*, methodological rules *and* introducing historicity into them. Helmholtz, in effect, replaces causality with the idea of *Gesetzlichkeit* (lawfulness), that is to say, the requirement that certain relations amongst certain processes have a nomological character (see Laws, natural §2). Lawfulness is, in fact, the only possible 'object' for cognition. In science, we do not know the imminent properties of real objects, but only the nomological regularity of recurring relations. There is no isomorphism between the external world and human cognition; simply put, cognition can only develop by presupposing the existence of a sort of parallelism of lawfulness (Heinrich Hertz develops this idea in his introduction to *Die Prinzipien der Mechanik (The Principles of Mechanics)* (1894), via the concept of a model). On the other hand, in place of the concept of substance, Helmholtz puts that of an invariant element. Most notably, he dissociates substantiality from materiality, which permits him to introduce in 1881 the 'elementary quantum of electricity' (the electron) as a nonmaterial, invariant quantity - a number, not a thing. What we know of the real is what we perceive as invariant,

in a manner which is, every time, historically determined, but without our ever being able to found science on a closed system of pure concepts.

Finally, the third 'Kantian question' which is fundamentally reformulated in Helmholtz concerns the *relation* between intuition and concept. For Kant, this relation was established in two different ways, depending on whether the subject matter was, on the one hand, science, or, on the other hand, art, language, religion or teleology. In scientific cognition (the domain of determinative judgments), what made it possible to link intuitions and concepts was the Schematism, the transcendental imagination's 'hidden work' (see Kant, I. §7). In the altogether different domain of reflective judgments - of taste (where the subject relates only to itself and where there cannot be any direct presentation of concepts in sensible intuition), only what Kant called the Symbolism was operative: an indirect mode of knowledge formation, which proceeds by analogy (see Kant, I. §12). This distinction shaped the entire subsequent history of the relationship between the exact and the human sciences during the nineteenth century in Germany (see Unity of science). It was, however, challenged by the increasingly open suggestion that, in science, as in art or language, there is only one single cognitive process. In this development, which leads from Wilhelm von Humboldt to Schlick, Cassirer and Wittgenstein, Helmholtz plays an essential role because he wants to provide a general theory of signs and symbols - that is, a general theory of cognition in which the Kantian distinction disappears. To be sure, he did no more than propose this: the hints we find in his various articles, and even the lecture of 1878, merely indicate the direction to be followed. But in 1910, Cassirer, in *Substance and Function*, claimed to have found in this theory of signs the idea that, in cognition, humans deal only with 'functional correspondences of one structure to another' - thus making Helmholtz the inspiration for the notion of 'symbolic forms'. And it is difficult not to see the influence of Helmholtz in the generalization of the concept of symbol for twentieth-century philosophers and scholars, from Husserl and Schlick to Bohr and Heisenberg - or even Granger and Goodman.

3 Conclusions

Helmholtz stands at a crossroads of research and ideas of diverse origin. He maintained, in a certain sense, the spirit of the Enlightenment in post-Hegelian Germany. But 'the Helmholtz effect' went beyond this. He touched upon the problems and the language of philosophy in a style both new and enduring, a style which has been clandestinely propagated well into the present. In his effort to reflect on each element of the Kantian account of cognition, Helmholtz accomplished, in effect, an unexpected dissolution of the Kantian critique. He analysed sensations, introduced the idea of unconscious memory and reduced intuition to its elementary processes: this reduction put the *body* in the foreground of the formation of all cognition and by so doing subjected geometry and arithmetic to the human *experience* of movement. Furthermore, Helmholtz expanded the concept of intuition and restricted that of causality by substituting for it the idea of lawfulness: this gives the formation of mathematical or physical concepts complete *freedom* with regard to the constraints of objectification via the tetralogy space-time-causality-continuity (which Bohr later used to define 'classical' physics). In addition, by generalizing the concept of symbol, Helmholtz abolished the fundamental Kantian distinction between science on the one hand and merely analogical knowledge on the other: this opened the way to a global conception of cognition as a construction of systems of signs. For those who read Helmholtz, cognition became a learning process anchored in bodily experience. At the same time, it was freed from the illusion in which concepts reflected stable and objective properties of things, and could thus turn towards the simple search for invariance. Finally, cognition emerged everywhere as a symbolic construction (sensations, language, sciences, art or religions), as a historically determined interpretation of that which is perceived as given for a particular epoch. Helmholtz not only brought the nineteenth century to a close, he set the stage for the twentieth in nearly every discipline.

Helmont, Franciscus Mercurius van (1614-98)

Although he lived in the seventeenth century, van Helmont belongs more to late Renaissance than to modern intellectual culture. He was a larger-than-life figure who, in his prime, had an international reputation as an alchemist and a physician. His metaphysical interests came increasingly to the fore, however, and he became particularly associated with Kabbalistic doctrines. A friend of Locke and Henry More, he was also closely connected with Anne Conway and Leibniz, with whom he shared many intellectual affinities. It is these connections that make his philosophy - in particular, his theodicy and his monadology - of enduring interest.

Franciscus Mercurius van Helmont was born at Vilvoorde, near Brussels. His father, Jean-Baptiste van Helmont, was a famous Paracelsian medic who made a significant contribution to the history of chemistry, especially to the theory of gases. Like his father, Francis became famous as both doctor and alchemist. He too was harassed by the Inquisition, from whom he escaped only by giving up the estate he had inherited. Later, in the freer context of the Protestant Netherlands, he was able to publish many of his father's writings that had been previously suppressed. Indeed he became a publisher of many religiously heterodox works and, with characteristic courage, allowed his name to be associated with some whose actual author was anonymous. For this reason a number of works were mistakenly attributed to him. Even those of which he was the author were often produced by collaboration, or written up by others on the basis of conversations with him.

Van Helmont's first book was concerned with developing the idea of an alphabet of nature, a natural rather than a conventional language originally spoken by Adam. He made practical proposals arising from his theory for teaching those born deaf to speak and to understand speech, which some implemented with success. Over time, however, he became less interested in experiments and more metaphysical than his father had ever been, partly through the influence of Knorr von Rosenruth with whom he collaborated on a German translation of Boethius' *De Consolatione Philosophiae*. He also assisted him in collecting together the mostly Hebrew texts made available for the first time in the Latin *Kabbala denudata* in 1677 and 1684, to which he contributed writings which include his *Cabbalistical Dialogue*, a classic defence of Kabbalistic metaphysics.

Van Helmont was physician to Lady Anne Conway from 1670 until her death in 1679. They came to share not only a commitment to Kabbalistic metaphysics and Biblical interpretation but also an involvement with the Quaker movement. He saw to the publication of her Platonic/Kabbalist *Principles of the Most Ancient and Modern Philosophy*. Although outside the mainstream of Modern philosophy, he became a good friend of Locke whom he met at the Lantern Club in Rotterdam and with whom he spent the winter of 1693-4 during his last visit to England. Like van Helmont, Locke was also a physician, but the bond between them seems to have been a sceptical and liberal attitude concerning speculative matters of religious importance.

Of greater philosophical significance was his friendship with Leibniz, with whom he was associated in the early 1670s and again in the late 1690s. The extent to which they belonged to the same intellectual tradition is shown by their accounts of evil and of matter. For van Helmont and others there is a puzzle as to how God, a wholly perfect being, could have created pain and suffering, supposing these to be evils. There is also a problem of how, if God is pure spirit, he could have produced something as alien to himself as matter. Van Helmont's solution to the first problem lay in a form of optimism in which God is claimed to allow no more suffering than is necessary. As to belief in hell, all punishment is 'medicinal' and no soul is ultimately lost. His opposition to the arbitrary and vindictive god of some of the major Christian denominations is reflected in this view. He also followed the Lurianic Kabbalah in adopting the doctrine of the evolution of human souls through twelve lives, linked to belief in the eventual progress of every soul to eternal happiness. He managed to secure quite a following for this view among the English Quakers, until it was quashed in a revival of orthodoxy in the early 1690s.

Van Helmont's solution to the problem of the existence of matter is analogous to his treatment of the problem of evil, with the counterpart to optimism being a form of idealism, that is an affirmation that only spirit is ultimately real. Matter, being antithetical to God's nature, cannot result from that nature, and so is not so much a reality as a privation. A philosophy, such as Aristotelianism, that affirms the reality of matter must, he thought, deny the existence of a spirit creator. According to van Helmont's Neoplatonic-Kabbalistic theory, the monads emanate as pure spirits from the divinity. But these sparks of divinity eventually become 'dull' and 'sluggish', coalescing to

form what is called matter. Yet the monads, though they are in a degenerate state of ‘privation’, do not entirely lose their individual or spiritual character, which ‘*fundamentally* and *radically*’ they retain. Their material state is only transitory, according to van Helmont, and they will eventually return ‘to a more loose and free state’.

Leibniz’s solutions to these problems, though they have affinities, are more complex and less obviously open to objection (see Leibniz, G.W. §§2-6). Between the early 1670s, when van Helmont impressed Leibniz in long and deep discussions, and the 1690s, when he visited Hanover as an old man, Leibniz himself had changed. He had become too much of a Modern not to be embarrassed by van Helmont. The work published in his friend’s name often lacked rigour, sophistication and paid no attention to recent developments in the sciences. Van Helmont was fluent in Dutch and German but not in Latin or English, and so could only produce works in these languages by recruiting the support of people whose versions of his thought did not, in Leibniz’s view, do him justice. This may be partly why Leibniz himself was willing to help in the production of van Helmont’s last Kabbalistic work on the Book of Genesis, being entirely responsible for the Latin and even being to some extent a co-author. It was shortly after this collaboration that van Helmont returned to the Brabant to settle his affairs. After his death his niece turned to Leibniz for an epitaph, but appears to have ignored his plea to publish some of her uncle’s literary remains.

Help and beneficence

Which people are we morally required to help, and to what extent? In a world where the basic needs of many millions remain unmet, this is a philosophical question of great practical urgency. A minimal position is that while it is always praiseworthy to help someone, we are morally required to help only those to whom we stand in some special relation. In addition to the objection that it is too minimal, this view faces difficulties in accounting for emergency cases, in which one could, for example, save a stranger's life at little cost to oneself. More stringent views that place no restrictions on the range of people to be helped do not have these difficulties; they do, however, raise the intractable problem of how much we must sacrifice for the sake of others.

1 Principles of beneficence

A requirement to help or benefit a person to whom one stands in some special relation (such as a family member) is a 'special obligation'. A requirement to benefit people generally is a 'principle of beneficence'. Some principles of beneficence require us to promote other possible aspects of 'the good' in addition to human wellbeing, but our focus is on this central case. Further, as our topic is the general form principles of beneficence might take, we will not consider different possible accounts of wellbeing (see Eudaimonia; Happiness), though of course any actual principle of beneficence requires such an account. Nor will we discuss the problems that arise when a person who could genuinely be helped opposes the intervention (see Autonomy, ethical; Paternalism).

The idea of a general principle of beneficence, as distinct from special obligations, has roots in the West in Judaism and Stoicism, and was developed in Christianity in the form of the virtue of charity (see Charity). We should note here that possession of a virtue involves a certain motivational state, whereas following a duty or obligation need not (see Virtues and vices §§4-5; Duty §3). The scope of this entry, however, does not extend to the question of ethically appropriate motives, nor to the question of the 'natural' motivational sources of beneficent action (see Moral motivation).

Locke understood charity as requiring us to meet the serious needs of any person (1690); this is a more stringent requirement than the duty of beneficence Kant argued for (1797) (see §2). But the modern moral philosophers who take beneficence most seriously are the utilitarians: the whole of morality, on their view, consists in a requirement to promote - indeed to maximize - the good (see Utilitarianism). And the utilitarian tradition has no doubt influenced many non-utilitarians in their attitude to beneficence. It is notable, for example, that W.D. Ross (1930), who argued strongly against the reduction of all of morality to beneficence, accepted, as part of morality, a duty of beneficence of the same stringent maximizing form as the utilitarian principle.

Recognition of a principle of beneficence of some form continues to be common in moral philosophy in the late twentieth century, even among philosophers who reject the primacy of duty and obligation: 'virtue theorists' are likely to discuss a virtue of charity or benevolence (see Virtue ethics). There is, however, an important school of thought, with historical roots in parts of the social contract tradition, that relegates beneficence to the realm of the supererogatory (that is, morally good but not morally required) (see Supererogation §§4-6). This position is at its most plausible in the context of a liberal egalitarian theory of justice, such as that of John Rawls (1971) (see Rawls, J.). The idea is not merely that a just institutional scheme will remove the need for individual acts of beneficence, but that on a proper moral understanding, requirements of justice exhaust the normative domain claimed for requirements of beneficence. An important objection to this view is that it leaves it unclear what is required of a well-off individual in an unjust society; this problem is especially serious in the international sphere, where the prospect for institutions that promote distributive justice is remote. Advocates of the view could reply that unmet human needs do indeed raise an urgent moral issue, but that it is extravagant to respond to this issue by attributing responsibility for the wellbeing of all humanity to each moral agent (see §2). Rather, we should see the responsibility of individuals as mediated: they are required to support reform of the institutional structures that allow the needs to remain unmet.

There is a further difficulty for a moral account in which beneficence is supererogatory. While 'ordinary' moral thought is by no means settled on the issue of beneficence generally, it does seem to be so on the special case of easy assistance in emergency situations. That it would be wrong to walk away from a child drowning in a shallow pond seems so uncontroversial a claim that some philosophers, notably Peter Singer (1972), have seen in such

'rescue' cases firm intuitive foundations for an argument for a general principle of beneficence. This argument could be blocked by offering some principled distinction between rescue and non-rescue cases and by suggesting that the former generate some kind of special obligation. It is by no means clear, however, that a principled distinction is available.

2 The problem of demands

A principle of beneficence makes each of us responsible, in some sense and to some degree, for the wellbeing of everyone else. As we have noted, this can seem to be an extravagant position. The underlying worry here is simply that principles of beneficence require too much from individuals. Applied to utilitarianism, this 'over-demandingness objection' is long-standing, going back at least to Henry Sidgwick. But the issue of over-demandingness has received most attention since the 1970s, stimulated in part by a more general attack on modern moral theories that has centred around the work of Bernard Williams.

It might be thought that the cause of the extreme demands of the utilitarian principle is that it requires us to promote all aspects of the wellbeing of others, and that a more plausible principle of beneficence would require us to meet only the most basic of human needs, such as those for food, shelter, and health care. A principle of beneficence, however, that requires us to do whatever we can to meet even just these needs remains, in the circumstances of the late twentieth century, extremely demanding on individuals. The principle would, of course, be much less demanding if all or most people complied with it, but clearly we cannot assume ideal levels of compliance when assessing actual demands. (That the utilitarian principle is extremely demanding is sometimes denied on the grounds that an individual is rarely in a position to make great sacrifice that will be beneficial on the whole; this claim is typically based on scepticism about, for example, the effectiveness of humanitarian aid programmes.)

The real cause of the extreme demands of the utilitarian principle is its maximizing form: it requires individuals to promote the good up to the point where further sacrifice would burden them as much as it would benefit others. If extreme demands are objectionable, then a possible plausible principle of beneficence would seem to be one that requires sacrifice only up to a certain point. As an example there is the Judaeo-Christo-Islamic idea of giving up a 'tithe' or tenth of what one produces or earns. The problem, however, is to identify the criteria that would justify any particular limit to demands. Indeed it is on reflection difficult to accept that there could be a limit to required sacrifice that remains fixed whatever the changes in circumstances.

Other non-maximizing principles are possible. Thus Kant's duty of beneficence, on some interpretations, requires agents to adopt a 'maxim' of benefiting others, where this is compatible with acting to benefit others only rarely and in minor ways. For someone who takes beneficence seriously, this will be an unacceptably minimal principle. Likewise, the suggestion that no particular degree of beneficence is morally required, that all we need say is 'the more the better', will be seen as too close to the view that beneficence is supererogatory. A third view is motivated by a concern not with the extent of the demands of a maximizing principle, but with the way it imposes demands when not everyone is complying with it. As we have noted, a maximizing principle typically demands more of a complying agent as the number of other people complying decreases; this is to make agents responsible not just for their own 'share' of the demands of beneficence, but also for the shares of everyone else. If this is objectionable we could consider a principle of beneficence that requires agents to sacrifice only as much as it would be optimal for them to sacrifice under full compliance. Among other problems, it is not clear that this suggestion can account for rescue cases.

Helvétius, Claude-Adrien (1715-71)

Helvétius was one of the most noteworthy and notorious figures of the French Enlightenment. In common with his fellow philosophes*, he asserted that all philosophical discussions should be based on the empiricism of Locke's Essay on Human Understanding (1689). But unlike Voltaire, d'Alembert, and the other members of 'the party of humanity', Helvétius took literally the notion that each person is a*tabula rasa *at birth - he boldly argued the case for unabashed environmental determinism. We are what our surroundings have made us, and nothing more.*

Immediately after Helvétius published De l'Esprit in 1758, the Catholic authorities cited his book as definitive proof that the philosophes *were out to destroy religion, throne, family, and all that is sacred. Only the struggle between court and parliament over control of censorship, along with his ties to Madame de Pompadour and the Duc de Choiseul, saved Helvétius. After suffering the indignity of three recantations, he decided upon posthumous publication of his second major work, De l'Homme (1773).*

Not a single philosophe *accepted Helvétius' view that the mind is a completely passive recipient of data received through the senses; nor did any of his comrades second his constantly reiterated claim that all sensibility may be reduced to physical sensations. Some privately expressed their exasperation that Helvétius published so much that seemed to vindicate every charge the Church lodged against them: that they were materialists, advocates of free love, and champions of a scandalous hedonism. Nevertheless at least a few of the* philosophes*, after setting aside the philosophical suppositions of De l'Esprit, came to appreciate that the larger concern of Helvétius was with their own search for the social and political preconditions of an independent intelligentsia, the would-be agents of Enlightenment.*

1 Philosophy

An empiricist, a materialist, and a utilitarian, Helvétius was in every respect a son of the French Enlightenment, yet his fellow *philosophes* remained wary of his writings, which they regarded as a *reductio ad absurdum* of their own.

When Helvétius began his studies with the announcement that all the faculties of the human mind - memory, imagination, judgment, reason - can be reduced to sensation, he undoubtedly believed he was merely repeating what Condillac had set forth in his celebrated *Treatise on Sensations* (1754). Neither Condillac nor any of the *philosophes* had anything but praise for Locke's attack on innate ideas (see Locke, J.). Where Locke went wrong, in Condillac's estimation, was in his retention of the notion of innate mental faculties. Conducting one of the most memorable thought-experiments of the century, Condillac slowly brought a hypothetical statue-man to life, first by endowing it with one sense after another, then by showing how one sense comes to the aid of another, until a being emerges whose mind possesses all the higher mental faculties.

To the *philosophes* the *Treatise on Sensations* was a method of research; it provided the means to disprove all notions of innate ideas, especially as used by the Church to place its views beyond the reach of criticism. Alone among their numbers, and much to their dismay, Helvétius transformed Condillac's method into a system of reductionist philosophy. No longer did the investigation end when painstaking analytical and genetic procedure slowly uncovered the hidden sensual roots of a given faculty of mind. Rather, the books of Helvétius begin with the dogmatic assertion that none of the faculties is anything more than the passive product of sense experience.

No support was forthcoming for the position staked out by Helvétius, not even - as the response of Diderot attests - from other materialists. Overwhelmingly in the eighteenth century, French materialists grounded their position in the newly emerging sciences of life. Sensitive matter, to Diderot, acts on its surroundings no less than the environment shapes matter. Where Helvétius denied the significance of organic constitution, Diderot believed that much of an individual's character is given from the beginning, and will ultimately win out regardless of environmental circumstances. To Helvétius a new environment makes a new person; to Diderot criminals cannot be rehabilitated because it is impossible to override heredity and physical organization.

In ethics Helvétius was a hedonist and a utilitarian, so it is understandable that Bentham regarded *De l'Esprit* and *De l'Homme* as forerunners of his work, all the more so since on more than one occasion Helvétius uttered words virtually identical to Bentham's formula of 'the greatest good of the greatest number'. But had Bentham taken a

closer look, he might well have rejected the notion that Helvétius was his predecessor; for hedonism as understood by Bentham had only the slightest connection with sexual liberation and was in every respect the opposite of a heroic ethic. How shocked, then, Bentham would have been to realize that the primary objective of Helvétius was to recreate the heroic values of antiquity in the modern world, a goal the Frenchman sought to pursue through the lure of sexual rewards.

Surprisingly, it was to ancient Sparta that Helvétius looked for a model of a sexually liberated social existence. Previously Sparta had been regarded as the home of a repressive civic virtue, a city whose citizens were forced to be free, forced to live in accordance with the dictates of their ‘higher selves’. Self-denial and self-overcoming, a constant and painful effort to put the public good above private interest - these themes, long associated with Sparta, were sometimes admired by the *philosophes* but always rejected, because the virtue of Spartans sounded too much like the monkish virtue they despised. Altogether different was the Sparta depicted by Helvétius. Drawing upon Plutarch’s life of Lycurgus, Helvétius conjured up a Sparta in which men eagerly engaged in noble deeds for their country because the greatest citizens were granted the sexual favours of the most beautiful women. ‘Lycurgus made love one of the principal springs of legislation’ (1758, II: 15); he understood that it is great passions that lead to great actions, and was wise enough to stir up grand emotions through the custom of having naked young women dance in front of youthful soldiers, praising the brave men and shaming the cowards.

All the *philosophes* agreed that the reverse side of denying original sin was an affirmation of the joys of sexuality. They also concurred that virtue and self-interest should not be set in opposition to one another; their shared view was that society should be so ordered that everyone has an interest in acting virtuously. However, it was one thing for Diderot to praise the free sexuality of Tahitians in an unpublished essay and quite another for Helvétius to publish and sign his name to an equally audacious proposal, and to imply, unlike Diderot, that his findings were directly applicable to the Europe of his day. The official Diderot, the public spokesman for the cause of enlightenment, was the author of *The Natural Son* (1757) and *The Father of the Family* (17??), two plays that endorsed conventional familial ideals in language that could not have been more exclamatory.

Diderot complained that Helvétius spent so much time attempting to prove that his kennelman, if placed in the proper environment, could have written *De l’Esprit*; he gasped in disbelief when he saw that Helvétius, in reducing everything to physical sensibility, was forever trying to explain the accomplishments of a genius in terms of copulation and defecation. Still, that did not prevent Diderot from placing *De l’Esprit* ‘among the great books of the century’.

What was it that Diderot and some of the other *philosophes*, for all their misgivings, admired in the writings of Helvétius? Above all, they gained a political education from his works; his conviction, that only through better legislation would humans ever have an interest in being virtuous, became theirs as well. ‘Morality is only a frivolous science unless blended with politics and legislation’, wrote Helvétius (1758, II: 15), ‘from which I conclude that, to be useful to the world, philosophers must consider objects from the viewpoint of the legislator’. Originally Diderot and many of the *philosophes* showed very little interest in forms of government; it was from Helvétius, a political thinker from the outset, that they learned how intimately their concerns about literature and the arts were tied to questions about politics.

2 Politics and the Arts

Both *De l’Esprit* and *De l’Homme* are primarily studies of the social situation of the *gens de lettres*, the intellectuals, under different political regimes. The maturity or childishness of the audience, its willingness or refusal to be instructed as well as entertained, the popularity of certain literary genres and the irrelevance of others, the inspiration or desperation of the writer - these matters and more hinge on the type of political regime that rules a country, argued Helvétius.

Helvétius adapted his study of the links between politics and the arts from Montesquieu. But before taking anything from the *Spirit of the Laws* (1748), Helvétius deleted Montesquieu’s chapters on climate. Why rule out in advance the possibility that the peoples of some parts of the world can ever hope to live under better conditions, inquired Helvétius, when political and social explanations suffice to account for their present predicament?

Although he rejected climate as a causal explanation, Helvétius kept intact the entirety of Montesquieu’s typology of political regimes, the division of governments into feudal monarchies, Oriental despotisms, and republics

ancient and modern. Sparta, as we have seen, was the ancient republic most frequently cited by Helvétius; England, called by Montesquieu a ‘republic hiding under the form of a monarchy’, was the country Helvétius constantly alluded to when he wished to draw a contrast between the monarchy France was and the republic he desired it to be.

The constant complaint of Helvétius was that ‘our [French] mores and the form of our government do not permit us to deliver ourselves to strong passions’. Under monarchy, petty intrigue at court to enhance one’s reputation takes the place in politics that under a republic is filled by the ambition of citizens to win fame for doing great deeds for their country. Wherever monarchy is triumphant, there are subjects rather than citizens, and the socially best-placed of these subjects care only for their personal advantage and that of their family name. A good aristocratic father in France will use all his influence to secure a public office for his incompetent son. How different was the world of republican Rome wherein Brutus did not hesitate to sacrifice his sons for the sake of preserving the public good.

From top to bottom of the social scale Helvétius found nothing to admire and much to condemn in the France of his day. So downtrodden were the peasants, so dehumanized were they by the brutality of the nobles, that Helvétius deemed the life of savages preferable to that of the simple folk living in the French countryside. Nor, for that matter, was the existence of Parisians as admirable as foreign visitors were wont to believe. Beneath the glamour and brilliance of operas, dramas, and salons lay a disturbing human reality. To be successful in social life, Helvétius noted, a man must have a pliable character that assumes as many shapes as the number of mansions he visits. Perhaps it is no accident that it was shortly after the publication of *De l’Esprit* that Diderot penned a memorable depiction of a ‘man without character’, who had ‘no greater opposite than himself’, in *Rameau’s Nephew* (1762-74).

The novelty of Helvétius lies in his efforts to apply Montesquieu’s sociopolitical models to the study of literature and the arts. Each type of political regime, the despotic, the monarchical, and the republican, shapes culture in its own image, Helvétius believed. Montesquieu had hinted as much: he had gone so far as to suggest that satirical writings cutting the powerful down to size thrive in England because in that nation society no longer revolves around feudal privilege and legally sanctioned class hierarchy. It was left for Helvétius to convert Montesquieu’s passing suggestions into a systematic treatise on politics and the arts.

About Oriental despotism Helvétius had relatively little to say. He was willing, however, to risk a few statements on the subject of politics and the arts in the non-Western world. It was his contention that Oriental authors, if they ever told the truth, had to present their thoughts in coded form. ‘Under submission to arbitrary power,… it is certain that writers must insensibly contract the habit of thinking allegorically’ (1758, III: 29). Since the historians of despotic countries, unlike the poets, cannot hide behind a veil of allusions and symbols, their account of the past is inevitably a pack of tricks the living play on the dead.

For the most part Helvétius concentrates his energies on drawing a series of sharp contrasts between the vitality of the arts and letters in republican England and the waning of literary glory in monarchical France. Living in a nation that is not politically free, looking up to *grands* who are idle, spoiled, and vain, the French are ‘the most gallant, the most loveable, but the most frivolous people of Europe’ (1758, II: 20). Boileau, repeating Horace, had indicated that the calling of the writer is to instruct as well as to please; Helvétius, however, complained bitterly that the French, ‘by the form of our government, have less need of instruction than of amusement’ (1758, II: 20). Love affairs, flirtations, coquetry, changes of fashion in clothing, and other private matters, none capable of stirring great passions, are the concerns of monarchical subjects. One trivial preoccupation supplants another with remarkable rapidity in France because persons confined to the pettiness of private lives are readily bored. For years the explicit objective of the *philosophes* had been to mould the new phenomenon they referred to as ‘public opinion’; Helvétius’ response was to point out that a public exists only where there is a republic.

‘In London it is a merit to be instructed; in Paris it is ridiculous’ (1758, II: 20). Inevitably, then, the English writer is inspired, the French writer diminished, by the audience.

> In a free state a man conceives the highest thoughts and can express them as vividly as they enter his mind. Such is not the case in monarchical states: in these countries the interest of certain corporations, that of various powerful individuals, and most of all a false and small politics, thwart the *élans* of genius.

(*De l'Esprit*, IV, ch. 4)

Helvétius was typically French in his belief that drama is the highest of the arts, and he was typical of his century in his conviction that the theatre of his day was inferior to that of the *grand siècle*. But he sounded a new note when he offered a political explanation of the decline of French drama. In republican England, he suggested, the grandeur of the tragic genre still holds sway; by contrast, in monarchical France the pettiness of comedy dominates the stage. Tragedies similar to those written by Corneille during a period of sedition and grand passions continue to be well received in England; but in France, beginning with Racine, the corrupted audience has become as indifferent to uplifting public themes as it is eager for love stories.

> I say that in every country where the inhabitants have no part in the management of public affairs, where the words *patrie* and *citoyen* are rarely cited, one does not please the public except in representing on the stage passions agreeable to [private] individuals, such as those of love.

(*De l'Esprit*, II, ch. 19)

Romantic love makes us small; love of country enhances our stature, and there is no better way to promote great civic passion than through offering sexual rewards which satisfy the cravings of physical sensibility. Greek tragedies were as replete with civic lessons as they were devoid of the motif of romantic love. Modern playwrights may yet return to the model set by Sophocles, provided modern legislators precede them in copying the political strategies of Lycurgus. In the posthumous *De l'Homme* Helvétius proposed to convert France into a federation of thirty republics, each animated by civic passion.

3 Conclusion

One of the favourite topics of the *philosophes* was the question of how the intellectuals could become independent and influential voices for enlightenment in a social world based on privilege, wealth and patronage. It was Helvétius who convinced at least a few of the *philosophes*, especially those who remained outside the academies, that only a political solution would suffice. In a civic society writers will be inspired by an enlightened audience and rewarded for their creative efforts. Until the dawn of the new era, the best book will be the one that champions the republican cause.

Evidence of what some *philosophes* eventually borrowed from Helvétius, as well as what they chose to repudiate, may be found in the *Système social* of the Baron d'Holbach, published fifteen years after *De l'Esprit* and at virtually the same time as *De l'Homme*. Almost word for word Holbach repeated the arguments of Helvétius against dramas revolving around the theme of romantic love and in favour of tragedies modelled on those of ancient Greece. Again echoing Helvétius, Holbach complained that the French were a frivolous people, the women especially because they had been miseducated by erotic paintings and literature, in consequence of which the favourite pastime of the *grands* was adultery.

When it came to women Helvétius and Holbach could not have been more similar in their diagnosis, nor more different in their solutions. Holbach advocated that women withdraw from high society to the privacy of their families. Motherhood, fidelity, and a restoration of traditional familial virtues was his message. Only if women accept the sanctity of marriage will men recover from their socially induced corruption. Helvétius, in dramatic contrast, would abolish the remnants of feminine modesty so that 'the favours of women, becoming more common, will appear less precious' (1758, II: 20). Long ago Plato had made a similar suggestion, and Lycurgus - Helvétius believed - had transformed theory into practice.

Helvétius was not a great thinker, but he was surely one of the most daring writers of his age.

Hempel, Carl Gustav (1905-1997)

Hempel's defence of Carnap's and Neurath's physicalism testifies to the presence of certain 'postmodern' themes in logical empiricism (or logical positivism): (1) a textualist turn to sentences from the facts or reality they are said to report; (2) a pragmatic turn from truth to inclusion in the text as the basic scientific concern; and (3) a descriptive turn from logic to empirical sociology of science.

Throughout his philosophical writings Hempel held that the question of what truth-claims mean should be replaced by the question of what criteria we use in deciding whether or not to call sentences true. Granted that 'Whales are mammals' is true if and only if whales are mammals, the question remains of how observation reports bear on whether or not to include a sentence in the text of current knowledge, and how received observation sentences may be dropped from it. For Hempel, then, the problem of analysing the concept of confirmation of sentences by sentences is either the heart of the problem of truth or the successor to that problem. Like Carnap, in 1945 he thought such an analysis necessary to connect the terms 'logical' and 'empiricism'; but four decades later he would conclude that, after all, one must 'leave the decision in matters of confirmation to the intuitive appraisal of the scientist' (1945b: 98).

1 Life

Born in Oranienburg of Prussian stock, Carl Gustav Hempel (called 'Peter' since his school days) studied mathematics, physics and philosophy at Göttingen, Heidelberg, Vienna and Berlin, where he received the Ph.D. in 1934 for work with Hans Reichenbach, lately dismissed from his professorship on account of his Jewish ancestry. In Brussels (1934-7) he was employed by his fellow exile Paul Oppenheim as a philosophical tutor-collaborator. When Oppenheim left Belgium in anticipation of a German invasion, Carnap obtained a research grant for Hempel, taking him to Chicago (1937-8). In time he found teaching posts at City and Queens Colleges (New York, 1939-48) and Yale (1948-55). Much courted, he then taught at Princeton (1955-75) and other universities, notably Pittsburgh (1977-85), and lectured widely (for example, in Beijing in 1982), before finally retiring to Princeton. He has received countless honours, including nine honorary doctorates and is much loved.

2 Confirmation

Hempel's paradox of the ravens has been a persistent challenge for theories of confirmation. Adumbrated (1937: 222) in a critique of Reichenbach's treatment of the probability of laws, it emerged as an illustration of the 'paradox of confirmation' (1945a). The sentences (1) 'All ravens are black' and (2) 'All non-black things are non-ravens' are logically equivalent; each simply denies the existence of non-black ravens. But if reports of black ravens confirm (1), then on the same showing, reports of non-black non-ravens confirm (2). Therefore, since any report confirming a sentence equally confirms any logically equivalent sentence, we have a seeming paradox: reports of non-black non-ravens (for instance, white shoes) confirm the hypothesis that all ravens are black.

Hempel's own account of the conditions under which observation-sentences confirm general sentences (1943, 1945a) can be summarized as follows. Consider an observation report in which certain names appear - perhaps, in the ravens case, just '*a*' and '*b*', where the report is the pair of sentences: '*a* is a black raven', '*b* is a non-black non-raven'. This report is said to *directly* confirm (1) because it logically implies the restriction of (1) to the individuals mentioned in it; and it is said to *indirectly* confirm all other logical consequences of sentences it directly confirms. In the present example the restriction of (1) to '*a*' and '*b*' is the sentence (0) 'If *a* is a raven then *a* is black and if *b* is a raven then *b* is black'; and since the report does logically imply (0), it directly confirms (1), and indirectly confirms (2).

This purely classificatory analysis of confirmation makes no distinction between white shoes and black ravens as sources of confirmation for (1); but perhaps that is because those two sorts of evidence confirm (1) to very different degrees. Hosiasson suggested that while reports of black ravens and white shoes both confirm (1), the latter confirm it to a much lower degree, in the light of our background beliefs about the rarity and homogeneity of ravens (Hosaisson 1940).

Hempel and Oppenheim (1945b) propose a quantitative account of degree of confirmation of hypotheses *H* by evidence-sentences *E*. If the language in which *H* and *E* are stated can classify members of the (finite) population

into non-overlapping, exhaustive categories, then a statistical distribution is an assignment to these categories of definite proportions in the population. Relative to different distributions, a sentence of the language may have different probabilities. Now the degree of confirmation of *H* given *E* is defined as the probability that *H* and *E* are both true divided by the probability that *E* is true - both probabilities being determined by a 'maximum likelihood' distribution, that is, a distribution making *E* as probable as any distribution can (1945b: 112).

In Carnap the role of the maximum likelihood distribution in this definition is played by the average of all possible distributions (Carnap 1950: appendix). Carnap's degrees of confirmation then satisfy all laws of probability, including one violated by the Hempel-Oppenheim definition, namely, the 'multiplication principle', according to which the probability that *A* and *B*, given *E*, is the degree of confirmation of *A*, given *E*, times the degree of confirmation of *B*, given that *E* and *A* are both true. Hempel and Oppenheim preferred their definition to Carnap's on grounds of empiricism; where Carnap assigns equal a priori probabilities to all possible distributions, they choose a distribution by reference to the evidence sentence *E*. They offer their definition as establishing fair betting-odds on *H* given *E*, thus accounting for one aspect of confirmation. Other aspects - number and variety of instances reported in *E* - remain to be accounted for by some other concept, which would determine the amount it would be fair to stake in bets at those odds (1945b: 114). But that view was hard to maintain in the face of Ramsey's and de Finetti's 'Dutch book' arguments for the multiplication principle, showing that 'If anyone's mental condition violated [it], his choice would depend on the precise form in which the options were offered him, which would be absurd' (Ramsey 1931: 182). This would be part of Hempel's later disenchantment with the project of an inductive logic (see Confirmation theory §1; Probability theory and epistemology §1).

3 Law and explanation

From Frege (1879: §12) and Mach (1883: ch. 4, §4.3) through the various phases of logical empiricism, scientific laws were taken to have the same logical form as other factual generalizations; especially, the suggestion was resisted that scientific laws are marked by modal operators, as in 'Necessarily, all Ps are Q' or 'Being P makes things Q'. Where Mach put this as a metaphysical claim - 'In nature there is no cause, no effect; nature is only there once' (1883: 455) - the logical empiricists put it as a decision about the language of science; it is to be extensional. But they saw the function of laws and theories as the systematization of otherwise unwieldy bodies of particular empirical claims, that is, data compression, Mach's 'economy of science'. This would accord well with the puzzling character of fundamental physics that emerged with increasing clarity during the twentieth century, with quantum theory providing predictions of unprecedented accuracy, explicable only as being what the theory provides. Here Hempel's 'covering-law model' of explanation matched the consensus of physicists that accurate systematization is all we can reasonably ask in the way of explanation - 'understanding' being a secondary psychological state that may come with familiarity (see Laws, natural §1; Logical positivism §§2-3).

Hempel identifies laws as those truths of the forms 'Every physical object is so-and-so' and 'Every space-time point is so-and-so' that make no essential reference to particular physical objects or space-time regions (1965: 271). The seemingly limited generalization 'All ravens are black' is really a universal generalization in which 'so-and-so' stands for 'black if a raven' and 'if' is read extensionally, as 'or not'. If that generalization is a law, 'raven' must be definable without essential reference to the planet Earth, as is presumably the case if biology is reducible to physics.

A deductive explanation of an event is a logical deduction of an 'explanandum' sentence, asserting that the event happens, from premises (the 'explanans') which are either general laws or statements of antecedent conditions (1965: 249). Hempel thought that this put explanation on a par with prediction, the difference being attributed to the timing of the explanandum-event, that is to say, after or before the act of prediction or explanation, respectively. In inductive explanations the requirement of logical deductibility is weakened to high logical probability of the explanandum, given the explanans. Since the conditional probability of a statement is highest (that is, 1) given statements that logically imply it, deductive explanations are also inductive explanations - of the strongest sort (see Explanation §§1-2).

4 Theoreticity and cognitive significance

Explanation is systematization. Hempel proposes a measure of the power of a theory *T* to systematize putative data *S* (1965: 287). The idea is that the content of a sentence is determined by the possibilities it rules out, so the

content of a sentence is represented by its denial, and the common content of two sentences by the sentence 'Both are false'. Measuring contents by logical probabilities of denials, Hempel then measures *T*'s power to systematize *S* by the ratio of the measure of their common content to the measure of *S*'s content, that is, by the logical probability of *T*'s falsity, given *S*'s. The idea is applied to 'the theoretician's dilemma': if theoretical terms and laws do their work of deductive systematization in linking observational antecedents to observational consequents, they are otiose, for functionally equivalent rules in a purely observational vocabulary can then establish exactly the same inferential transitions; but this overlooks the role of theoretical terms and principles in *inductive* systematization of observational sentences (1965: 186, 122).

Following Wittgenstein (1922), logical empiricists rejected metaphysics as empty of cognitive content. Early on, this was derived from the so-called verifiability criterion, identifying the content of a sentence or a system with the set of ways in which it might be refuted by experience. Like tautologies, such as 'What will be, will be', metaphysical sentences were thought to be unfalsifiable, and so to be empty of cognitive content. Hempel famously chronicled and sharpened the problems and changes attending attempts at logical definition of this concept, for example, the replacement of the verifiability requirement by confirmability (1965: 101-22). He concludes: 'cognitive significance in a system is a matter of degree: Significant systems range from those whose entire extralogical vocabulary consists of observation terms, through theories whose formulation relies heavily on theoretical constructs, on to systems with hardly any bearing on potential empirical findings' (1965: 117).

5 The career of logical positivism

Logical empiricism was meant to be scientific philosophy, applying the new logic to the structure and methods of all the sciences, as Whitehead and Russell had to mathematics in *Principia Mathematica* (1910-25). The products would be purely logical definitions - of confirmation, explanation, systematic power and so on - but their selection or design would be determined pragmatically, by the needs of science. That was Carnap's view, anyway; and Hempel's, for nearly half a century. But where Carnap's hopes were steady to the end, Hempel's eventually turned from logical analysis to Neurath's old project of *Gelehrtenbehavioristik* (empirical sociology of science) - in loose alliance with Kuhn (1962, 1970), but with fresh concern for the justification of scientific norms.

Henricus Regius (1598-1679)

Henricus Regius supported many of Descartes' doctrines, such as the distinction between mind and body, but disagreed with Descartes' arguments for that distinction, and rejected metaphysics. Their differences led to a celebrated public dispute which lasted until Descartes' death.

Henricus Regius (Hendrik De Roy), one of Descartes' first Dutch disciples, also studied in France and Italy. In 1638 he was appointed professor of Theoretical Medicine and Botany at the University of Utrecht. Through Henricus Reneri he became deeply influenced by Descartes' *Discourse* and *Essays* of 1637, meeting Descartes in 1638 (see Descartes, R. §§1, 8). When Reneri died in 1639, Regius became the primary representative of Cartesianism at Utrecht.

Regius first presented his natural philosophy in a series of disputations in 1641, published as *Physiologia sive cognitio sanitatis*. It incurred the wrath of the Theological Faculty and of the University rector, Gisbertus Voetius. Most controversial were his denial of the scholastic doctrines of matter and form, and his assertion that the human being is an accidental unity. With Descartes' advice, Regius replied to the attacks in 1642. This elicited a formal condemnation of Descartes' philosophy at the University, and Regius was forbidden to teach physics. Descartes responded in the 'Letter to Father Dinet' (1642), which appeared with the Amsterdam edition of his *Meditations* publicly attacking Voetius, who then focused his attention on Descartes.

Throughout this time, Regius was summarizing his own natural philosophy. Descartes disagreed with certain crucial aspects of it and urged him not to publish, but *Fundamenta physices* appeared in spring 1646, followed by *Fundamenta medicinae* in 1647. Descartes consequently denounced Regius in the preface to the new French edition of the *Principles of Philosophy* (1647). Regius responded with *Explicatio mentis humanae* (1647b), emphasizing his points of difference. Descartes retorted with *Notae in programma quoddam* (1648), and finally Regius published *Brevis explicatio mentis humanae sive animae rationalis* (1648).

Bitter as these exchanges were, Descartes is thought to have forgiven Regius before his death in 1650, and Regius continued to be identified as a Cartesian. He remained at Utrecht until his death, a person of some importance in the University. Although he did not write anything new after the 1640s, he published later editions of the *Fundamenta physices* in 1654 and 1661.

Regius rejected scholastic philosophy, embracing a version of the new mechanical philosophy. Like Descartes he distinguished between mind, a thinking substance, and body, an extended substance. The details of his general physics, for example his conception of the laws of nature, are similarly indebted to Descartes, as are his views on human physiology. But there are also notable differences. Descartes' physics was grounded in metaphysics, in God, the human soul and in the validation of reason. Regius rejected metaphysics, beginning his philosophy directly with physics. He also disagreed with the Cartesian arguments for the distinction between mind and body: in the *Fundamenta physices* he argued that the real distinction can be known only by Biblical revelation. In the *Explicatio* (§2), he went farther still: 'so far as the nature of things is concerned… mind could be either a substance or a certain mode of corporeal substance'.

Regius also attacked Descartes' proof of the external world. According to Descartes, God gave us a strong inclination to believe that bodies cause sensations, and no means to correct this strong inclination. Therefore, he would be a deceiver if there were none. Apart from the fact that God might deceive us to punish us, Regius did not think God would be a deceiver if no bodies existed, since we are capable of withholding our assent to their existence, viewing our sensations as mere appearances which may not have bodies as their causes. Again, it is revelation that assures the existence of the external world. Finally, Regius rejected Descartes' innate ideas and all ideas of pure intellection; we have only sensation, imagination and memory - all our ideas come to us from experience. Pierre Gassendi is a possible source of some of Regius' non-Cartesian theses.

Henry of Ghent (early 13th century-1293)

Perhaps the most influential theologian between Thomas Aquinas and Bonaventure in the third quarter of the thirteenth century and John Duns Scotus at the beginning of the fourteenth century, Henry of Ghent stands at a turning point in scholastic philosophy. He was a defender of traditional Neoplatonic positions and has often been seen as the epitome of thirteenth-century Augustinianism. Yet his convoluted metaphysics and a theory of knowledge weaving together Neoplatonic and Aristotelian strands inspired novel philosophical trends in the fourteenth century, particularly among Franciscan thinkers. His work thus constituted the point of departure for scholastic giants like Duns Scotus and William of Ockham, who not only used him as a foil against which to articulate their own system of thought but also absorbed much of his fundamental philosophical outlook and terminology.

Characteristic of Henry's metaphysics was an essentialism so pronounced that critics accused him of positing a realm of essences separate from worldly actuality. In his defence, Henry insisted that essences, though prior to actual existence, were separate only as grounded in the divine exemplars of things, but the Platonism of his approach struck his contemporaries as extraordinary nonetheless. Ironically, Henry's understanding of essence as congruent with intellectual coherence provided an opening for a more logic-based analysis of modality, especially possibility, in succeeding thinkers such as Duns Scotus.

The emphasis on essence re-emerged in Henry's theory of knowledge, and at least in his early writings he offered a vision of knowing truth through divine illumination often taken as paradigmatic of medieval Augustinianism. Even his later attempts to cast epistemology in a more Aristotelian light retained the insistence that true knowledge somehow entails access to the exemplary essences in God's mind. The same essentialism led Henry to formulate what he called an a priori proof for God's existence, best approximation in the thirteenth century to Anselm's ontological argument. Again, however, Henry's Augustinianism provided an unintended springboard for innovation, leading to Duns Scotus' theory of the univocity of being and metaphysical proof of God's existence.

1 Life and writings

Henry was born in Ghent early in the thirteenth century, but we know little about his life before 1275 or 1276, when he assumed a secular chair as master of theology at the University of Paris. By this time he was already working his way up the ladder of ecclesiastical politics in the Low Countries, having been appointed canon at the wealthy episcopal see of Tournai; soon after he was named archdeacon of Bruges, and finally in 1278 or 1279, archdeacon of Tournai. In 1277, Bishop Etienne Tempier of Paris included him in the commission of theologians assigned to examine the orthodoxy of doctrines being taught at the University. Their report led to the list of 219 proscribed propositions in philosophy and theology issued in Tempier's famous condemnation of 1277 (see Averroism; Boethius of Dacia; Siger of Brabant).

By this point, Henry had become aligned with conservative thinkers fearful of the influence of a radical Aristotelianism among Parisian masters of arts and alarmed even by the moderate Aristotelianism of Aquinas and his followers in the school of theology (see Aristotelianism, medieval). Members of this group rallied to the banner of Augustine, and because of the prominence of Franciscans within their ranks they have often been characterized as proponents of a peculiarly Franciscan Augustinianism (see Augustinianism). Ironically, Henry was a bitter opponent of the Franciscans in the political disputes of the late thirteenth century over the conflicting rights and privileges of regular and secular priests.

Henry died in 1293 after an illustrious career at the centre of intellectual debate. His chief works are a series of fifteen *Quodlibeta*, the carefully revised redactions of public disputations which he held nearly annually at the university from 1276 to his withdrawal from academic life the year before his death, and his *Summa* - more properly, *Quaestiones ordinariae (Ordinary Questions)* - a massive compilation of edited classroom debates on questions of philosophy and theology that he left only half finished. Although the latter presents itself as a self-contained and independent work, it was laboriously put together over the same span of time as the *Quodlibeta* and parallels them in chronicling the development of Henry's ideas throughout his career.

2 Metaphysics

Like many of his contemporaries, Henry began with the conviction, promoted by Aquinas, that the most fundamental divide in reality lay between essence and existence. In contrast to Aquinas he interpreted the division so as to give priority to essence. Going back to Avicenna (see Ibn Sina), he claimed that the broadest way of conceiving of an object was as ‘thing’ (*res*), a concept shorn of all consideration of the conditions of being, particular or universal, mental or extramental, actual or hypothetical. Void of ontological significance, ‘thing’ was thus the marker of essentiality alone, and its intelligible content could be represented solely by essential or quidditative descriptions, pointing to the ‘what’ of objects exclusive of the ‘whether’ or ‘how’ of their existence.

Yet despite their formal opposition to being, quidditative descriptions varied according to how dense their ‘thingness’ was: in other words, how suitable they were to represent actual existing objects. The most tenuous - least ‘real’ - kind of thing included all that could be described, even barely imaginable constructs which would not withstand scrutiny for logical coherence. This was the vast domain of ‘thing’, opposed only to that which was absolutely nothing at all. Henry called it *res a reor reris*, by which he meant ‘thing’ insofar as it embraced any content that could be grasped by mind or imagination and which we might translate as ‘imaginable object’. Less thin was ‘thing’ that was not only imaginable but also internally consistent enough to be suitable for becoming an object in the real world. The domain of this kind of ‘thing’ was of course less extensive than *res a reor reris*, since it contained only objects more truly ‘thing-like’ or ‘real’ and thus more worthy of being denominated by the terms ‘essence’, ‘nature’ or ‘quiddity’ in their proper sense. Henry called such objects *res a ratitudine* - that is, ‘things’ as disposed to rational analysis - and among them he located Avicenna’s absolute essence, which he understood to be essence separated from existence but opposed to the less-than-absolute nothingness of incoherent figments of imagination. Finally - and least thin - was the realm of ‘things’ in the world, objects not only inherently suited to existence but in fact existing. This field of things was naturally the narrowest, but it was denser or more ‘real’ than either of the other two. Henry called its constituents actually existing things (*res existentes in actu*) or things of nature (*res naturae*).

Such a hierarchical vision of ‘thing’ was more intricately articulated than any consideration of essence produced before, and in order to accommodate it Henry had to introduce distinctions on the other side of the divide, in the category of ‘being.’ According to him, there were two kinds of being. First was being of essence (*esse essentiae*), a state less than actuality, characterizing objects at the level of *res a ratitudine* and constituting that which separated them from more nothing-like imaginary objects that could not bear logical scrutiny. Second was being of existence (*esse existentiae*), the full being of actuality possessed by all real objects in the temporal present and therefore proper to *res existentes in actu*. From this it followed that there was a two-fold composition of being and essence, the first a combination of absolute essence with the special being distinguishing it from the purely ephemeral whatness of imaginable fictions, the second the joining of such essence with actual existence (see Existence).

The result was that Henry, while maintaining the being-essence distinction, had managed to undermine its radical duality, shifting the analytical balance strongly to the side of essence. By his scheme essences, even when considered ‘absolutely’, already possessed a sort of being that lifted it into the domain of non-fictive things, so that even on a conceptual level essence was never completely denuded of implications of being. Furthermore, essence, taken along with its special sort of being, was clearly prior to existence. One might almost describe it as ‘resident’ in an essential realm ready to receive the actual existence that, in Henry’s words, ‘came to it’ and accounted for its presence in actuality. For Henry, then, being was more like a variable quality of essence in its different states than a fundamental constituent of reality, as it had been for Aquinas. Giles of Rome, Henry’s contemporary at Paris and an extreme defender of the Thomistic real distinction between essence and being, continually attacked Henry on this score. Henry’s response was to invent a distinction intermediate between the purely conceptual and the real - what he called an intentional distinction - and to insist that essence and its two kinds of being were ‘intentionally’ distinct. This tour de force of metaphysical compromise fed into the similarly controversial ‘formal distinction’ of Duns Scotus.

Already strongly Neoplatonic in his essentialism, Henry exaggerated the tilt in his metaphysics by tying his theory of essence to Augustine’s exemplarism. What made an essence an essence, Henry claimed - what explained its being more coherent than an imaginary object and a bearer of being of essence - was the fact that it corresponded to a formal ideal in the divine mind. Essence was essence because it was exemplified, because it was the image of a conceptual exemplar in God. Indeed, the being of essence was reducible to the relation between the exemplified and its exemplar. God’s knowledge made essences what they were, and each was a sort of participation in the

divine being.

Henry took this idea so far as to approach a Platonism astonishing even among thirteenth-century Augustinians (see Platonism, medieval). Contemporaries such as Godfrey of Fontaines accused him of positing a world of essences, eternal and separate from God, since by Henry's terms each essence had its own being of essence different from the existence of a created thing in the actual world. Indeed, it is hard not to read some of his statements about exemplified essences as implying what Godfrey claimed. Yet Henry vigorously rebutted such accusations, insisting that being of essence was not an attribute things could have without also possessing being of existence and thus not a separate state of being. It was rather the metaphysical purchase on actuality that a coherent essential content had as something suitable for existence. In the case of objects not actually existing in the external world, essence was manifested, and possessed its being of essence, just insofar as it was actualized in the intelligible processes of an existing mind. This could be the mind of an intelligent creature, like a human being, considering the essence abstracted from any particular instances external to its thought; it could also be the mind of God. Of course, before creation it was only in God's mind that essence could thus take shape. Eternal essences fell back completely on the ontic grounding of God's eternally active mind and so were identical with the divine ideas, thus substantially identical with God (on this controversial point see Marrone 1985: 122-7).

A system of this sort, isolating essence as an absolute in itself but also grounding it eternally in God, required considerable philosophical elasticity to accept, but it paid handsome metaphysical dividends. For Henry, essences were not purely fictive constructs on the level of *res a reor reris*, but quidditative contents that could be made existent. They constituted, therefore, all simple possibles. Besides providing an exposition of the relation between God and the rest of reality, Henry's theory of essence thus promised to lay bare the foundations of modality as well. In this connection it must be remembered that in Henry's words what made an essence an essence - what constituted it as a possible - was, first, its being represented by an idea in God's mind but, second, its possessing a coherent intelligible content, formally entailed in its corresponding to a divine idea. In the end, Henry was suggesting that what separated possibles on the essential level of *res a ratitudine* from fictive impossibles on the level of *res a reor reris* was internal consistency, with all essences being made up of logically compatible parts. Despite the fact that Duns Scotus criticized Henry's ontology of essence as unworkable and implausible, it provided a major inspiration for his own innovative ideas about modality, which were formally quite similar to those Henry had laid down.

3 Theory of mind and knowledge

Henry's epistemology is often taken as emblematic of thirteenth-century Augustinianism, but it was likewise the area of his thought in which he did most to bring new elements of Aristotelianism into a more traditional Neoplatonic base. This was the side of his philosophy most subject to development throughout his career, where it is especially important to pay attention to the chronology of his ideas.

In the early sections of his *Summa*, Henry laid out a theory of knowledge dependent on a notion of truth as rightness deriving from Anselm and insistent on the inadequacy of the unaided human intellect to achieve fully reliable knowledge without God's help, traditionally described in Neoplatonic terms as an illumination from the divine intelligible light (see Neoplatonism). This first statement of his views about knowledge and truth constitutes the most detailed thirteenth-century exposition of the theory of divine illumination and was taken as the paradigm of illuminationism by later Augustinians such as Duns Scotus, who criticized any such theory as philosophically unsustainable. According to Henry's position, human intellect begins with the data of sensation and works its way by purely natural means to an approximate understanding of an object's essential composition, an understanding neither completely clear nor precise. Henry called this 'knowledge of the true' (*verum*). Only after it had reached this point could the mind call upon its reflexive capacities and God's aid to refine its understanding until it was fully clear and adequate to the theoretical requirements for certain knowledge of the truth.

The first step in the refining process involved taking the cognitive representation of the object achieved in the initial understanding - which Henry identified at that stage of his career as an intelligible species - and comparing it to the external thing again as known through the senses, critically reshaping it into a precise image of the object's essential characteristics. The results of this comparison, Henry said, were preserved in the mind as what he called an expressed concept or 'word' (*verbum*), and it was with this 'word' that mind first reached a grade of cognition worthy of being called knowledge of the truth (*veritas*) and sufficient for the beginnings of scientific

thought. From simple truths gathered in this way, one could construct a system of intellection adequate to the standards Aristotle had established for science in his *Posterior Analytics*.

Yet such truth, and such science, was still imperfect, because the human mind working on its own was subject to error. For absolute certitude, and perfect science, the intellect had to turn to God, calling upon an illumination from above to confirm its insights and correct its mistakes. Although Henry described this second step in various ways, his preference was to see it as a comparison drawn by the mind between the word of truth established at the lower boundaries of science and the eternal exemplar rendered intelligible by God through illumination (see Illumination). The expressed concept, rectified to suit the contours of the divine ideal, was now fashioned into a vehicle for knowledge of the ‘full truth, pure and simple’ (*sincera veritas*), upon which could be constructed an absolutely reliable system of knowledge.

Already evident in this early view was Henry’s intention to make room for Aristotle and the epistemology of the *Analytics* in the rarefied world of illuminationism and exemplarism. Yet in the years 1279-81 he took far greater steps to amplify his commitment to an Aristotelianizing theory of knowledge. In Quodlibets IV and V and in Article 34 of the *Summa*, Henry revisited his description of the process by which intellect moves from apprehension of the true to an understanding of truth worthy of science. He now insisted that the initial apprehension constituted genuine knowledge of the quiddity or essence of an object, although not a precise articulation of all quidditative parts. The way the mind worked its way from this imperfect knowledge to the truth was by applying the Aristotelian procedures of composition and division - what Henry called ‘the art of definition’ (*ars definitiva*) - progressing by means of analysis to a description of essence precise enough to provide the foundation for apodictic science. This precise description, an authentic Aristotelian definition, was manifested in the intellect by what Henry characterized as the refined mental concept or word, which he now conceded to be indicative of the pure truth he had previously reserved for understanding illuminated by God.

At the same time, Henry took parallel steps in his theory of mind. For all his early illuminationism, he had always rejected the notion, advanced by Augustinians like Roger Bacon in the mid-thirteenth century, that God was the agent intellect responsible for human cognition, or the equally Augustinian view that the ideas of things were impressed by God on the mind at its creation. Instead, he held to what he took to be authentic Aristotelianism: the claim that the human intellect possessed its own active power to generate knowledge from sensory data. In these middle years he fleshed out his understanding of this power by combining an Augustinian conviction that the mind was autonomously active and capable of producing knowledge on its own with an understanding of the mechanics of mind drawn from Averroes (see Ibn Rushd). The most striking feature of this synthesis was the notion of a possible intellect rendered active by its initial reception of the concept of the quiddity and working to turn out higher forms of cognition, an idea Henry consciously patterned after Averroes’ ‘speculative intellect’.

Henry carried the emphasis on intellectual activity so far as to reject entirely the notion of intelligible species, which he now saw as tokens of a passivity unworthy of the dynamism of the human soul (Nys 1949). Instead, all knowledge from the very start was contained in his ‘expressed concepts’ or ‘mental words’, products of the immanent agency of intellect as it reached out to grasp the essences of objects, and which could be regarded as those very essences residing in the mind as understood by it. Such a notion of intellectual immediacy was unusual in Henry’s day, but it prepared the ground for the idea of intellectual intuition found later in Duns Scotus as well as the even more radical theories of intellectual agency developed by Ockham and his followers.

Such views enabled Henry, by the end of his career, to find a way of reaffirming the divine presence in human cognition conveyed by his early epistemology of illumination. If mental words were nothing less than the essences of objects brought onto the mind’s cognitive field, they were then the perfect expression of Avicennian absolute essence, shorn of external existence and instantiated solely by the actuality of an intellect’s active consideration. But, of course, absolute essences were eternally present in divine cognition. Here the profound essentialism of Henry’s ontology emerged in full force, leading him to assert that the essence the human mind knew and the essence known by God were the very same on the rarefied level of being of essence. Thus every intelligent agent touched on things at just the point at which they participated in the divine mind, so that knowing the definitive truth in Aristotelian terms was, in a real sense, knowing the object as it bore an ideal relation to God. Henry’s mature understanding of the divine role in human intellection caught Duns Scotus’ attention as much as the literally illuminationist views of Henry’s early years, and he took aim against this as well in his criticism of

traditional Augustinian theories of knowledge.

4 Transcendentals and proof of God’s existence

The essentialism of Henry’s metaphysics and the exemplarism lurking behind even his most Aristotelianizing versions of a theory of knowledge encouraged him to make extraordinary use of the emerging doctrine of transcendentals (see Language, medieval theories of). Although he had insisted that ‘thing’ was the broadest term which could be used to describe an object, Henry agreed with his scholastic predecessors that the first and most general concept available to the human intellect was that of being (*ens* or *esse*). This term, transcendental in the sense that it was logically prior to the generic division of things into the ten categories, brought the mind face to face with the participationist foundations of reality.

Like all thinkers before Duns Scotus, Henry conceded that ‘being’ at its most general was strictly equivocal, disjunctively applicable to the irreducibly distinct realities of God’s being and the being of creatures. Yet although these two ‘beings’ had nothing really in common, they were similar enough - related by means of analogy - to give rise to concepts that were extremely close. Indeed, Henry said that in its initial perception of being, the mind was so deluded by this similarity as to mistake the two concepts referring to the being of God and that of creatures for a single concept.

The mind’s confusion on this point looked to Henry like a most fruitful mistake. After all, his account of the conceptualization of being did not mean simply that the mind took two different concepts or terms to be the same. It actually stipulated that from the start the human intellect was confronted with a dual object: the unlimited being of God and the finite being of creation. From this, Henry concluded that every human intellect had a natural knowledge of God: not a knowledge impressed on the mind at creation, but rather one springing naturally from its very first act of understanding.

Implausible as this position might appear from an Aristotelian point of view, it was fully in line with the cognitive implications of Henry’s own metaphysics, which opened the mind to a world of essence vibrant with the participatory relation between creature and creator. Moreover, it allowed Henry to support what he said was Avicenna’s opinion that the human intellect could naturally construct an a priori proof for the existence of God. Such a proof would be a priori not in the sense that its foundations preceded sensory perception but rather because it arose from a primitive quidditative understanding of the divine being and did not have to be argued a posteriori from the evidence of created existence. If in its first, imprecise efforts to grasp ‘being’ conceptually the mind formed two general concepts so vague and indeterminate as to appear identical, upon reflection it would realize that what it took to be one idea was in fact two. First would be the concept of the ‘negatively indeterminate’ divine being, inherently incompatible with any limitation whatsoever; second, there would be the concept of a ‘privatively indeterminate’ created being, not yet reduced to any genus or species but necessarily determined in that way in every real case outside the mind. For all its vagueness, the first of these two concepts was in fact quidditative and proper to God, adequate to the demands of a priori demonstration.

With this assertion Henry left contemporary theologians behind, most of whom were content with an a posteriori proof for God modelled on the Aristotelianizing inclinations of Aquinas or Averroes. Yet his ideas impressed the following generation. For all his criticism of Henry, Duns Scotus’ radical position on the univocity of the concept of being and the way he worked from it to develop a quidditative argument for God’s existence were inspired by his predecessor’s a priori proof (Marrone 1988: 49-56) (see God, arguments for the existence of).

5 Theory of will

Henry is generally credited with a voluntarist notion of moral action, in contrast to intellectualism of either the robust variety found in Godfrey of Fontaines or the mitigated strain of Aquinas and Giles of Rome. Although in fact no thinker of Henry’s day was voluntarist to the extent of completely severing the will’s choice from the practical intellect’s judgment, it is true that his philosophical position placed the autonomous power of will in sharp relief. For him, will retained free choice even after judgment, its actions entirely uncoerced by what intellect had decided. Although this did not mean that a free will would arbitrarily disregard intellect’s advice, Henry believed it did demand a distinctly non-Aristotelian account of causality in voluntary acts. The will could not act until it was presented with an object by the mind, but it was not the object, the mind’s judgment or any affect

triggered by the intellect that caused the will to act as it did. Instead, the will was entirely self-moved, endowed by God with an immanent power to go from potency to act (see Free will).

Henry went so far as to reject the Thomistic distinction between a primary freedom to act (*libertas exercitii*), independently available to the will, and a secondary freedom to act in a specific way (*libertas specificationis*), constrained by intellect's judgment. Instead, he claimed that the will was always free not just to act or not to act but also to specify the act it would perform. Anything short of this he took to be intolerably deterministic (Macken 1977b: 146-7, 158-9). As with other areas of his philosophy, Henry's vision of the will laid the groundwork for several Augustinian currents in the fourteenth century, feeding into the quite distinct moral theories of Duns Scotus and Ockham.

Henry of Harclay (*c*.1270-1317)

An English philosopher of the early fourteenth century, Harclay moved away from the position of Duns Scotus on the extramental existence of universals and towards the more conceptualist or nominalist stance of William of Ockham. On questions of infinity and continuity, Henry was strongly anti-Aristotelian, holding that there were numbers that were actually infinite and not all equal to each other, and that a continuum was composed of an actual infinity of indivisibles, by which it was properly measured. His position came under powerful mathematical attack.

Henry of Harclay, a member of a noble family from the North of England, received his education in arts at Oxford University and afterwards studied theology at Paris. He was much influenced by Duns Scotus, then teaching at Paris. In 1312, having returned to Oxford, he was elected and confirmed (by the Bishop of Lincoln) as Chancellor of the University. In this capacity in 1317 he journeyed to the papal court at Avignon in pursuance of a university dispute with the Dominican order, where he died.

In his commentary on the *Sentences* of Peter Lombard, representing his lectures at Paris in the course of attaining his theological qualifications, Harclay's teaching was very close to that of Duns Scotus, and he is counted among the first of Scotus' expositors. Later he adopted a more independent position, which has been seen as leading him in the direction of William of Ockham. His later thought is revealed in a number of disputed questions, whose contents have been rather spasmodically preserved in different manuscript codices. In one codex, pride of place is taken by a question as to whether astrologers or other 'calculators' can foretell the time of Christ's Second Coming. In this, Henry may be seen as upholding the claims of rational philosophy against the more mystical and inspirationist views of Arnald of Villanova, although he still allowed that the prophetic abbot Joachim of Fiore had made some true predictions.

On the vexed question of universals, Henry was concerned to diminish their extramental existence (see Universals). He held that each individual thing outside the mind could move the intellect to conceive it either confusedly or distinctly. By the latter conception the mind could distinguish Plato from Socrates, but from the former it received the general notion of man. Harclay's somewhat woolly, if not confused, view was attacked from the realist side by Walter Burley, and from the nominalist camp by William of Ockham, who said that the opinion was false, unintelligible, and neither true nor logical. In the case of relations also, Henry veered towards conceptualism, holding that, if *A* was related to *B*, this did not mean that the relation *inhered* in *A*. This in turn implied that God could be really related to his creatures, since no change was entailed in him. On the question of the univocality of being, Harclay held that there is one kind of being in both God and creatures, and in this he was close to Scotus (although with several differences of nuance) and fervently opposed to Thomas Aquinas, whose positions he often explicitly attacked.

It was in his views on continuity, however, that Henry went most strongly against the mainstream of scholastic philosophy. In these views, Henry built on the opinions of Robert Grosseteste, who had held that a line was properly measured by the number of points that it contained (and it would seem, although some scholars disagree, of which it was composed). To humans such numbers were infinite, but to God they were finite, and they could have between them both rational and irrational ratios. Harclay developed his views in two questions on the eternity of the world, concerning respectively its beginninglessness and its endlessness. Quite probably no schoolman held the heretical position that the world had actually existed from eternity, but there was controversy as to whether the opposite position could be proved by natural reason (see Eternity of the world, medieval views of). Those who held that it was impossible for there to have been an infinite past time were wont to cite paradoxes, such as that, if there had been an infinite past time, then there would have been the same number of past revolutions of the Sun as of the Moon, and in general that a whole would be equal to its part. Harclay's principal strategy in rebutting these claims was to assert that there could be actually infinite numbers, and that one of these could be greater than another. This was contrary to the conventional view that numbers were only potentially infinite, in the sense that there was no limit to how far one could go on counting; the question of comparing different infinite numbers did not then arise.

Harclay extended his arguments into questions concerning the structure of continua, holding that each was

composed of an infinite number of indivisibles, so that a line was made up of an infinite number of points. This again was opposed to the more holistic Aristotelian view that a continuum was infinitely divisible potentially (again in the sense of unlimited acts of division), but always into finite parts. It was certainly not composed of indivisibles, and was only measured by fictive indivisibles, as in treating feet as indivisibles for the measurement of lines. Harclay's position, like that of those who would compose continua out of finite numbers of indivisibles, gave rise to a host of difficulties. Among these was the question of how indivisibles could touch each other, for as Aristotle said, 'Since indivisibles have no parts, they must be in contact with one another as whole with whole' (*Physics* VI.1, 231b3). If that was the case, however, it was hard to see how they could compose something continuous bigger than themselves. Harclay's reply was that they did touch whole to whole, but according to a different position (*secundum distinctum situm*). Not surprisingly, such responses did not convince everyone, and among many attacks on indivisibilist positions, a devastating mathematically-based critique was made by Thomas Bradwardine, who cited Henry by name. However, Bradwardine did admit that he himself could be accused of a *petitio principii* by assuming the truth of the principles of Euclidean geometry.

Heraclides of Pontus (4th century BC)

Heraclides, a pupil of Plato, was roughly contemporaneous with Aristotle. Best known in antiquity as a writer of dialogues on moral and religious themes, he also held interesting views about cosmology and the structure of matter. Only fragments of his works survive.

Heraclides was probably born before 385 BC at Heraclea Pontica, on the Black Sea coast of modern Turkey, and lived into the penultimate decade of the fourth century. He received his philosophical training in Plato's Academy, where he may also have been influenced by Speusippus and Aristotle. Heraclides seems to have remained at the Academy under Plato's successor Speusippus, but retired to his home town after being defeated in the contest to succeed him.

Like Aristotle and other pupils of Plato, Heraclides made a transcript of Plato's lecture *On the Good* and wrote independent works on 'dialectic', moral and political philosophy, and religion, as well as literary and historical subjects. Today he is best known for two of his scientific theories. First, he combined a belief in the infinity of the universe with a system of planetary movements partly anticipating that of Tycho Brahe (see Kepler, J.): the earth rotates about its axis from west to east in one synodic day; the sun circles the earth from west to east in a year, presumably in the plane of the ecliptic; and the inner planets, Mercury and Venus, revolve about the sun on epicycles. We are not told his views on the movements of the outer planets.

Second, he believed that matter is made up of two kinds of particle separated by microvoids: 'corpuscles' (*onkoi*) and 'fragments'. Corpuscles themselves are constituted of 'fragments' (*thrausmata*) and may be broken down into fragments; fragments, however, cannot be broken down any further. The corpuscles have at least some of the sensible qualities of macroscopic bodies, but the fragments do not; thus the corpuscles are analogous to the atoms of modern chemistry, the fragments to protons and electrons.

Both theories were inspired by Plato's *Timaeus* (see Plato §16). In this text, the movements of Mercury and Venus were described, but not explained (38d); an axial rotation of the earth was thought by many to be mentioned at 40b-c; and Plato introduced a theory according to which each of the four elements consists of minimum particles shaped like one of the regular solids, and these in turn are constituted of and can be broken down into two kinds of triangle (54d-57c). Heraclides substituted three-dimensional 'fragments' for Plato's two-dimensional triangles; instead of seeing the elementary particles as geometrical constructs, he treated them as aggregates of matter. But his postulating two stages of aggregation distinguished his theory from other contemporary atomic doctrines, and this came to him from Plato.

There was a similar development in his doctrine of the soul. Like Plato, he believed that the soul is immortal and subject to reincarnation, but whereas Plato regarded it as incorporeal, Heraclides taught that it is constituted of 'light', the finest kind of matter; between incarnations, souls not wicked enough to be sent to hell congregate in one part of the heavens, where they form the Milky Way. With this doctrine we leave the field of science and come to that on which Heraclides' popularity rested: ethical and religious dialogues. His outlook was puritanical. He believed that the desire for pleasure corrupts both individuals and societies, with dire results; for the gods observe human behaviour and ensure that crimes are punished. His dialogues were full of such stories, and also revelations, including eschatological ones, miracles and sermons by ancient wise men including Empedocles, Pythagoras and the Scythian *shaman* Abaris. They were heady stuff and found readers until the end of antiquity.

Heraclides left no school. Cicero (§1) admired his style and used his writings as a model for his own dialogues, but the only reader to take his ideas seriously was the physician Asclepiades of Bithynia (see Hellenistic medical epistemology). Asclepiades work was based on Epicurean conceptions, but he adopted Heraclides' corpuscular theory; presumably he found it useful for explaining physiological processes.

Heraclitus (*c*.540-*c*.480 BC)

No Greek philosopher born before Socrates was more creative and influential than Heraclitus of Ephesus. Around the beginning of the fifth century BC*, in a prose that made him proverbial for obscurity, he criticized conventional opinions about the way things are and attacked the authority of poets and others reputed to be wise. His surviving work consists of more than 100 epigrammatic sentences, complete in themselves and often comparable to the proverbs characteristic of 'wisdom' literature. Notwithstanding their sporadic presentation and transmission, Heraclitus' sentences comprise a philosophy that is clearly focused upon a determinate set of interlocking ideas.*

*As interpreted by the later Greek philosophical tradition, Heraclitus stands primarily for the radical thesis that 'Everything is in flux', like the constant flow of a river. Although it is likely that he took this thesis to be true, universal flux is too simple a phrase to identify his philosophy. His focus shifts continually between two perspectives - the objective and everlasting processes of nature on the one hand and ordinary human beliefs and values on the other. He challenges people to come to terms, theoretically and practically, with the fact that they are living in a world 'that no god or human has made', a world he describes as 'an ever-living fire kindling in measures and going out in measures' (fr. 30). His great truth is that 'All things are one', but this unity, far from excluding difference, opposition and change, actually depends on them, since the universe is in a continuous state of dynamic equilibrium. Day and night, up and down, living and dying, heating and cooling - such pairings of apparent opposites all conform to the everlastingly rational formula (*logos*) that unity consists of opposites; remove day, and night goes too, just as a river will lose its identity if it ceases to flow.*

Heraclitus requires his audience to try to think away their purely personal concerns and view the world from this more detached perspective. By the use of telling examples he highlights the relativity of value judgments. The implication is that unless people reflect on their experience and examine themselves, they are condemned to live a dream-like existence and to remain out of touch with the formula that governs and explains the nature of things. This formula is connected (symbolically and literally) with 'ever-living fire', whose incessant 'transformations' are not only the basic operation of the universe but also essential to the cycle of life and death. Fire constitutes and symbolizes both the processes of nature in general and also the light of intelligence. As the source of life and thought, a 'fiery' soul equips people to look into themselves, to discover the formula of nature and to live accordingly.

The influence of Heraclitus' ideas on other philosophers was extensive. His reputed 'flux' doctrine, as disseminated by his follower Cratylus, helped to shape Plato's cosmology and its changeless metaphysical foundations. The Stoics looked back to Heraclitus as the inspiration for their own conception of divine fire, identifying this with the logos *that he specifies as the world's explanatory principle. Later still, the neo-Pyhrronist Aenesidemus invoked Heraclitus as a partial precursor of scepticism.*

1 Life and work

Heraclitus appears to have spent his life in Ephesus, which had been founded as a Greek colony some 200 years before his birth. According to ancient biography he was an arrogant and surly aristocrat, given to eccentric behaviour, but these anecdotes are largely a fictional construction built out of his own words, in which the tone he adopts in relation to other people is contemptuous. Rather than viewing this as a psychological trait, it is better to treat it as an extreme instance of the way early Greek poets and sages claimed authority for their work. Heraclitus, however, is exceptional in the explicit contempt he expresses for such hallowed authorities as Homer and Hesiod, and also for the contemporary intellectuals Xenophanes, Hecataeus and Pythagoras. He may have been on bad terms with his fellow citizens for political reasons, including perhaps support he received from King Darius of Persia, and it is likely that he was opposed to the democratic constitutions some Greek communities were beginning to adopt.

Although Heraclitus presents himself as uniquely enlightened, he was clearly familiar with the leading thinkers of his time. He draws attention to the relativity of judgments and the difference between humans and animals in ways that recall Xenophanes' critique of religious beliefs (see Xenophanes §3). He almost certainly knew and rejected Pythagoras' doctrine of the transmigration of souls (see Pythagoras §2). His cosmology is both indebted to and a criticism of Milesian science: the criticism appears particularly in his denial of the world's beginning, but his focus

on the law-like processes of nature has clear affinities with Anaximander's celebrated doctrine of cosmic justice (see Anaximander §4).

Heraclitus' work does not survive as a continuous whole. What we have instead is a collection of more than 100 independent sentences, most of which are *ad hoc* citations by authors from the period AD 100-300. Plato and Aristotle rarely cite Heraclitus directly, but their interpretations of him, which are influenced in part by their own preconceptions, shaped the ancient tradition of Heraclitus as exponent of universal flux and of fire as the primary material. Interpretation of Heraclitus is further complicated by the work of his professed follower Cratylus, and still more so by the way Stoics and Pyrrhonists looked back to him as a precursor of their own philosophies (see §6). This afterlife is important as an indication of Heraclitus' complexity and capacity to influence a range of very different thinkers, but modern interpretation of him rightly treats it as secondary to the evidence of his own words.

Heraclitus is credited with writing a book, *On Nature*, and depositing it in a temple of Artemis. Some scholars believe that the book was a later compilation of sayings that he never wrote down, but while many of the fragments are well suited to oral delivery, this scarcely applies to the longest one, with which he is said to have begun his book:

> Of this formula (*logos*) that is so always people are uncomprehending, both before hearing it and once they have heard it. For although all things come to pass in accordance with this formula, people seem lacking in experience even when they experience such words and deeds as I expound, when I distinguish each thing according to its nature and explain how it is. But other people are oblivious of what they do awake just as they forget what they do asleep.
>
> (fr. 1)

2 Methodology

Heraclitus presents himself as the deliverer of a *logos* (see Logos). Any speaker could make a similar claim, but Heraclitus' *logos* is not his personal message or thought. Rather, Heraclitus views himself simply as a conduit for *the logos*, *the* means by which his audience will learn the objective truth about everything. In characterizing the *logos*, Heraclitus claims that 'it is so always'; it is the world's rationale or determining formula, the key to each thing's nature.

The *logos* is accessible to thought and linguistic expression because it is 'common' or 'public'; but 'most people live as though their thinking were private'. Heraclitus uses this contrast, and the contrast between waking and sleeping, to signal the gap between experience people have in common and the erroneous or purely subjective opinions they typically base on that experience. Taken as a set of general truths, the *logos* includes such propositions as the following: 'All things are one', 'All things are an exchange for fire, and fire for all things', 'Nature loves to hide', 'War is father of all and king of all', 'The way up and down is one and the same', 'God is day night, winter summer, war peace, satiety hunger'. Heraclitus does not present arguments for these cryptic statements, nor does he elucidate them. His Delphic style is a deliberate provocation of thought, a way of rousing his audience to solve his riddling account of nature and to discover the *logos* for and in themselves. In order to do so, he suggests, they need to rid themselves of naïve empiricism, to 'expect the unexpected', to connect things that they normally keep separate, to practise self-scrutiny, self-knowledge - in short, they need to discover the 'depth of the soul's own *logos*', which presumably signifies the mind's unlimited capacity to arrive at a complete understanding of the *logos* of nature.

In addition to general statements of the kind illustrated above, Heraclitus uses many other kinds of sentence. These include comments on the lack of wisdom manifested by the supposedly learned as well as by ordinary people, graphic statements concerning the 'unity of opposites' and the relativity of values, instruction concerning the 'measures' of physical change, characterizations of the soul, and numerous injunctions about the wisdom, lawfulness and piety requisite for a good life. One ancient commentator described his book as consisting of three topics: the universe, politics and theology. Another called it 'a guide to conduct', and it was also described as being about 'society, with the treatment of nature being metaphorical'. Such attempts at systematizing Heraclitus are anachronistic, but they have the merit of recognizing his complexity. He was, as he describes himself, an inquirer into the 'nature' of things, but it would be no less correct to call him a moralist and psychologist; what he

derived from his inquiry was an urgent message about the need for human beings to refashion their values and their outlook in accordance with the implications of the *logos*.

3 Unity of opposites and perspectivism

In emphasizing the ‘unity of all things’, Heraclitus was not saying, as his Milesian predecessors had done, that every natural object is the manifestation of a single material nature such as water or air (see Anaximenes). Nor was he denying the obvious phenomenal difference between hot and cold, light and dark, living and dead, up and down. Heraclitus’ world includes the normal range of things that are different from one another. What makes all things one is the fact, as he sees it, that a common formula (*logos*) is at work in everything to which we attribute spatial and/or temporal identity and continuity. Such opposites as those just enumerated are not separate or separable from one another but are co-dependent contributors to the identity of things. In any day (regarded as twenty-four hours), light and dark are combined, as are up and down in any road. Nothing can be alive that will not die, and nothing can be dead that has not lived. If one of these opposites is removed, the other must go too.

Apart from cases where the co-presence or successive presence of opposites is *obviously* essential to things, Heraclitus drew support for the unity of opposites from examples where it could be inferred even though it was less obvious. In the bow and the lyre, he said, there is a ‘back-stretched structure’ (or ‘back-turning structure’ on an alternative reading). The effectiveness of both instruments depends upon tension between a piece of wood and a taut string. These components pull in opposite ways, and thereby they generate the unitary objects, lyre and bow. His famous image, ‘You can’t step twice into the same river’, is probably to be interpreted in a similar way. What gives the river its identity is the continuous flow of successively different water. If ‘All things flow’ is a statement that Heraclitus approved, it is best interpreted as his image for the claim that even apparently stable beings depend for their identity on the interchange or succession of their constituent parts or on conflicting forces. The image need not, and probably should not, be regarded as a claim that nothing has a stable identity, but rather that such stability as things do have is derived from the equipollence of their constitutive opposites.

The unity of opposites formula is also applicable to Heraclitus’ account of the way physical processes occur in the world at large. Changes of temperature and liquidity are constantly taking place, but they do so according to measure and balance. In the cosmic context, ‘All things are one’ obtains because a single thermodynamic principle (as it might be called now) is operative throughout the system: ‘an ever-living fire, kindling in measures and going out in measures’ (fr. 30). Another name for this principle, and another view of the unity of opposites, are evident in the statement that ‘God is day night, winter summer, war peace, satiety hunger. He alters as when [fire] mingled with spices is named according to each person’s pleasure’ (fr. 67). Two implications might be drawn from this passage. One is that, from a divine perspective, the contrary evaluations normally accorded to day *or* night, to war *or* peace, are transcended. The other is that human discriminations between these opposites are purely arbitrary.

Heraclitus certainly endorsed the first implication, but did so for the second only with qualification. The passage does indeed suggest a radical difference between the divine and the human, but Heraclitus’ point is probably that people need to adjust those of their perspectives that are purely personal or subjective and bring them into line with the objective way things are: it will always be the case that sea water is fair *and* foul, ‘fair for fish and foul for human beings’ (fr. 61). It is equally and necessarily the case that non-human animals have different preferences from humans. Yet the unity of opposites is a principle that also requires radical reordering of conventional opinions. Because the world is a dynamic interplay of opposing forces, ‘people must realize that war is common and justice is strife’ (fr. 80). In this difficult saying, Heraclitus is not recommending belligerence and the breakdown of civil society. His point is rather that people must come to terms with the fact that conflicting forces are basic to the way the world is structured - are in fact essential to its balance and order. That is how inanimate physical powers interact. He seems to have inferred, by analogy, that competition, involving winners and losers, is no less essential when accounting for the differences of status within his own day-to-day world. Hence the assertion that: ‘War is father of all and king of all; and some he has shown as gods, others as humans; some he has made slaves and others free’ (fr. 53).

4 Cosmology

Judging from the extant fragments, Heraclitus devoted only a small fraction of his philosophy to cosmology and explanation of physical phenomena. Many of his ancient interpreters, however, starting with Aristotle, interpreted

him as if this were his main purpose. Working from texts in which Heraclitus refers to the transformations of 'ever-living' fire, they concluded that he endorsed the following doctrines: first, that fire is the underlying principle of all things; second, that particular phenomena are composed of and resolved into fire by rarefaction and condensation; and third, that the world as a whole is an everlastingly repeated sequence of temporally limited cycles, each of which emerges out of fire and ends in fire. These 'doctrines', or at least the first and the third of them, are generally treated today as anachronistic attempts to fit Heraclitus' ideas into a pattern more applicable to other thinkers. Although this modern diagnosis is justified in part, ancient philosophers were clearly right in thinking that Heraclitus regarded fire as the world's primary and most explanatory phenomenon. The problem is to understand what he intended by this claim.

Some of his statements suggest that fire is what one should start from and end with in any reflection on natural change. He certainly thought that what would later be called elements or elementary qualities (hot, cold, moist and dry) are interdependent phases of a continuous cycle. Hence his use of statements such as 'The cold gets warm, the warm gets cold, the moist gets dry, the dry gets damp' (fr. 126). This kind of insight is obviously suitable as an illustration of the way 'All things flow' and the unity of opposites, but it does not explain why he said that 'All things are an exchange for fire, and fire for all things, as goods for gold and gold for goods' (fr. 90). What is it that privileges fire in the cycle of change and makes it the one appropriate exchange symbol for everything else?

The answer, authorized by the Aristotelian tradition, is that fire is *the* underlying principle or *the* element. An underlying principle or element should be the unchanging foundation of everything that changes, but Heraclitus explicitly denies that fire is like this. Rather, it is continuously changing, 'kindling in measures and going out in measures'. What is unchanging about Heraclitus' fire is the *way* it changes - according to 'measures'. Heraclitus uses the term 'measures' to indicate cosmic order, balance, proportionality, natural law. He probably inferred by observation that, of all natural phenomena, fire is not only the most dynamic but also the one that is most obviously self-regulating. A fire consumes all the material that is available to it, nothing more and nothing less. What it consumes it also changes. It lives, as it were, by destroying something else; or, viewed from another perspective, it destroys itself by creating something else.

Heraclitus' fire, then, is not merely *one* phase in the cycle of natural changes. As the world's 'currency' or exchange symbol, the sum of fire's activity is completely commensurate with the sum of everything else. Fire's gain is everything else's loss and vice versa. The reciprocity or exchange between fire and the rest of things is Heraclitus' principle of cosmic order. There is a clear similarity here to Anaximander, who invoked 'crime and retribution' as the model to explain how change (hot to cold, wet to dry, and so forth) is balanced and reciprocal. Heraclitus was clearly impressed by his predecessor's bold appeal to 'justice' as the regulating principle of natural processes. But he was entirely original in treating fire as the primary process of nature. Given the conceptual resources available to him, nothing could have served him better as the way to indicate that nature is a dynamic system, that apparently stable things are also processes, that apparent unities are also polarities.

This, then, appears to be what Heraclitus meant by premising his cosmology on 'ever-living fire, kindling in measures and going out in measures'. He probably did not think, as ancient interpreters supposed, that our world is everlastingly recreated and destroyed, but rather, that nothing exists outside the system of fire and its exchanges. The system is self-regulating, and because there is nothing to interrupt its rhythm it persists for ever. Heraclitus is the earliest Greek thinker to postulate an everlasting world, and he is also probably the earliest to apply the term *kosmos* (meaning 'beautiful structure') to the world (see however Pythagoras §2).

Did Heraclitus identify his cosmic fire with the god to whom he sometimes referred? Did he also think of these as the physical correlate or referent of his *logos* formula? Precise answers to these questions are scarcely possible, but his Stoic interpreters were probably not far wrong in answering affirmatively for him. Although he evidently took a huge step in the direction of treating the universe as an autonomic field of counterbalancing forces, he probably also thought of it as a mind-directed system. Some of the fragments seem to allude to a divine plan or purposiveness. Still more suggestive are connections he drew between fire, soul, life and intelligence.

5 Psychology, ethics and religion

No fewer than ten of the fragments are statements about the Psychē. In its primary Greek usage this term signifies a human being's life, but Heraclitus uses the word not only in this way but also to signify mind and intelligence.

He made a major contribution to the idea (immensely important to Greek philosophy from Socrates and Plato onward) that cultivation of the *psychē* is the prerequisite for living well.

‘Eyes and ears’, he said, ‘are poor witnesses to those who have barbarian *psychai*’ (fr. 107). In this dense statement Heraclitus likens the unenlightened majority to ‘barbarians’ - that is, foreigners, who lack the language and culture of genuine Greeks. In order to live authentically, one needs a *psychē* that can interpret empirical evidence correctly - a *psychē* that understands the truths expressed by Heraclitus’ *logos*. The *psychē* as such, he suggests, has unlimited resources, but in order to draw on them it is necessary, as he has done, to ‘inquire into oneself’. Such observations indicate that Heraclitus’ philosophy was simultaneously outward-and inward-looking: his *logos* is both the formula of nature’s processes and the account of a mind or a self thinking and understanding that formula.

Heraclitus forges a link between these two aspects of his *logos* by invoking fire in remarks about the *psychē*. He associates life, intelligence and excellence with fire and dryness; by contrast, it is ‘death for souls to become water’, and a drunken man (that is, someone who has lost his bearings) ‘has a soul that is moist’. We are probably intended to take these statements both literally and symbolically. This complex reading fits Heraclitus’ statements about fire in cosmological contexts, where fire is both a constituent of nature and the currency for understanding all processes. It is also relevant in the case of the *psychē*. Living beings derive their vitality from the ever-living fire, but what a fiery soul contributes to humans is not merely life but the ‘light’ of intelligence. It is entirely in Heraclitus’ manner to exploit the multiple resonance of words, and to demand interpretation that is metaphorical as well as literal.

The intelligence that Heraclitus seeks to kindle should, he suggests, make people rethink their beliefs about life, death, religion and society. He attacks the folly of religious rituals, especially blood sacrifice; he recommends strict respect for civic law and order; he contrasts ‘the best’, who seek immortal fame, with the bovine satisfactions of the majority. He particularly emphasizes people’s inability in general to come to terms with death, suggesting that the way one dies has a bearing both on one’s worth as a person and also on one’s postmortem condition. Does this last point refer to some kind of postmortem existence or simply to a person’s reputation after death? The latter seems the more likely, given his emphasis upon the cyclical phases of natural processes. Nothing seems to have mattered more to Heraclitus than persuading people to regard themselves as integral parts of an ineluctable cosmic order. From this perspective, we should organize our lives in the realization that we are mortal but intelligent phases in the cosmic life of ever-living fire.

6 Influence

Heraclitus’ influence on subsequent philosophers was large and complex. It is probably first evident in Parmenides (§§3-8), whose argument for a wholly changeless and homogeneous reality reads often like a direct echo and refutation of Heraclitus. In response to the Heraclitean philosopher Cratylus, Plato was impressed by the thesis that phenomena are in constant flux, but he rejected this as an account of ‘intelligible’ reality on the grounds that what is in constant flux cannot be known. Aristotle, taking Heraclitus’ combinations of opposites to be a flagrant breach of the principle of non-contradiction, interpreted him as ‘making all statements true’. It seems not to have occurred to either Plato or Aristotle that Heraclitus’ *logos* could be interpreted as the changeless and knowable formula of a world that is incessantly but regularly changing.

Heraclitus’ most penetrating and positive interpreters were the early Stoic philosophers. He inspired basic features of their cosmology, especially their identification of the world’s ‘active principle’ with divine fire, and they also gave their own slant to the Heraclitean *logos*, which they interpreted as the ‘rationality’ embodied in divine fire (see Cleanthes; Stoicism §3). A reading of Cleanthes’ *Hymn to Zeus* is the best way to view Heraclitus’ influence on Stoicism. In that text, Cleanthes reflects Heraclitus not only in his references to fire and *logos* but also in the way he presents the divine principle as reconciling opposites and embodying the laws of nature.

A further aspect of Heraclitus’ influence is to be seen in Aenesidemus, the founder of neo-Pyrrhonist philosophy. Aenesidemus was in the habit of citing Heracliteanism as ‘a route to scepticism’, basing this claim on Heraclitus’ way of predicating opposites of the same subject.

Herbart, Johann Friedrich (1776-1841)

From 1798, Herbart developed a 'realistic' alternative to the idealistic philosophy of Kant, Fichte,Schelling andHegel. His theoretical philosophy, which centres around metaphysics and psychology, is sharply critical of the idealistic concept of subjectivity. His practical philosophy rests on ethics and educational theory, each of which presumes the existence of the other.

Herbart laid the foundations for his philosophy by critically examining Fichte's philosophy in the late 1790s. Like Kant, Fichte had distinguished between theoretical and practical philosophy. UnlikeKant, however, he believed he could pinpoint the factor uniting them. Fichte called this uniting factor 'the ego', 'pure, absolute self-consciousness' (see Fichte, J.G. §§3-5).

Herbart responded by stating that it is true that we understand the ego to be identical with self. It is also true that this term suggests itself forcibly to us. However, we cannot conceive of the ego as constituting an identity of this kind, because it is a contradictory concept in itself. If the ego is to be comprehended as an act of 'conceiving of oneself' or as 'conceiving of one's ego', it should be possible for us to know *that* the ego is conceiving something, but not *what* it is conceiving. Fichte's concept of the absolute ego is therefore circular and incomplete.

This leads on to the theoretical part of Herbart's philosophy and into the realms of metaphysics and psychology. For Herbart, metaphysics consists first of a search for and analysis of concepts which are given but not conceivable, because they are contradictory in themselves. Contradictions of this kind present themselves not merely in terms of the concept of 'ego', but also in the concept of an individual thing with many characteristics (the problem of inherence), the concept of change (the problem of causality), and in the concept of matter. In Herbart's view, the second task of metaphysics is to map out a path showing how such contradictions in thinking can be resolved. This task is performed by methodology. In general terms, an attempt is made to demonstrate that the given contradiction in concepts (for example, identity of ego subject and ego object) rests on manifold, composite premises. While these premises are not apparent in the given concepts, the concepts refer to them as a part or outcome. Herbart calls this analysis the 'relations method'. Finally, his view of metaphysics incorporates ontology and 'synechology'. The task of ontology as the science of being is to cast light on the characteristics and structure of being, in other words to determine what is real in the appearances of things. While scepticism may prevail in respect of what we perceive or experience in the world, the fact that we do actually experience something cannot be denied or arbitrarily declared invalid. Experience as a state cannot be negated. For Herbart this implies that being means at any one time an 'absolute position'. Being is positive, *per se* simple, and beyond all relationship. The world we know is based on a multiplicity of simple entities, the 'reals', which are self-sufficient and react to change ('pressure') by seeking self-preservation. Synechology, then, determines the metaphysical manifestations in time and space of the multitude of individual reals which are in themselves simple (line, level, space; movement, speed).

By drawing on the essentials of metaphysics, Herbart was at the same time able to lay the foundations for his psychology. The 'true' basis of the concept of the ego, which is recognized as being contradictory, resides in the fact that Fichte's formula of the conceiving ego being identical with the conceived ego actually refers to a multiplicity of changing states, for which the formulas must be presumed. Herbart's explanation of self-consciousness as the essential task of 'realistic' psychology is as follows. Human consciousness is a mass of different interacting presentations. A study of their interaction gives rise to 'statics and dynamics' of the mind. The conscious separation of the act of conceiving from what is conceived is important for the development of self-consciousness. These two series of 'presentations' are joined by the concept of 'self' which presents itself, above all, in linguistic terms. Just as we say that water carves out its river bed 'for itself', we also project ourselves as the 'subject' of the act of conceiving onto a 'self' in which the conceiving and the conceived ego are deemed to be one and the same thing.

Herbart's practical philosophy also flows from his criticism of ego. Just as there can be no pure ego, there can equally be no pure, transcendentally free will (see Fichte, J.G. §§3-5; Kant, I. §11). A pure will would be a will which does not desire anything. That is a contradiction, however, since we always want something.

Herbart deduces from this that reason does not express itself as will, but rather as an aesthetic judgment. In the sphere of ethics, reason does not pass judgment on natural or artistic beauty, but on the well-balanced nature of human decisions. The fundamental judgment here is that human beings should gain an insight into what is good by dint of their will. This judgment leads to the 'idea of inner freedom' as consisting of a unity between insight and will. Herbart answers the question of which insight is good by presenting four more aesthetic ideas: perfection, benevolence, right and equity. These five ideas are directed at the individual. Similarly, Herbart derives five other ideas for society. In passing its judgment on aesthetic grounds, reason cannot induce morality (as a unity between insight and will). The fact that individuals can follow the judgments of reason is not a matter for moral philosophy or reason itself, but for educational theory. The primary task of educational theory - of 'educative instruction' - is to ensure that the child gains an insight. Its second task is to strengthen the will of the child and lead it to follow its insights - the task of 'discipline'. Ethics is ineffectual without educational theory and is devoid of any moral reality, while educational theory without ethics is devoid of any goal or reason.

Herbert, Edward (Baron Herbert of Cherbury) (*c.*1583-1648)

Responding, on the one hand, to religious conflicts over the question of the locus and interpretation of authority for deciding what constitutes authentic belief and, on the other hand, to general philosophical scepticism, Herbert of Cherbury wrote De Veritate (On Truth) in an attempt to determine the character and circumstances of true understanding. In this work, first published in 1624, he sought to enable people to decide for themselves, by the use of their reason, what they ought to hold. According to his thesis the touchstone for such decisions is provided by certain fundamental truths, the 'common notions', which all people recognize to be true once they have become aware of them. In two later works, De Religione Gentilium (On the Religion of the Heathens) (1663) and A Dialogue between a Tutor and his Pupil (1768), both published after his death, Herbert attempted to show that his position is not falsified by the evidence of wide differences among religions. His other writings include an important history of Henry VIII based on research into state papers, an autobiography that tells the story of his life up to 1624, and some poems. While this courtier, adventurer and diplomat was something of a failure as a public figure, and while he is commonly held to have essayed views about innate notions that were to be refuted by Locke's Essay, his writings provide pioneering studies in England in the genres of metaphysics, comparative religion and autobiography. Religiously he has been persistently maligned as 'the father of English deism' although closer consideration suggests that this reputation is not justified. He is, rather, to be considered an independent thinker who wanted to identify a form of religious belief that was rationally warranted and universally perceivable.

1 Life

Edward Herbert, the son of Richard Herbert of Montgomery Castle, was probably born in 1583. His mother was a close friend of John Donne. In 1596 he matriculated at Oxford where he is said to have established a reputation for learning. He attended the court of Queen Elizabeth and was knighted at the accession of James I in 1603. In 1608 he began a series of visits to the continent where, as a courtier and soldier, he observed the consequences of religious disputes. In 1619 he became English ambassador to the French Court. While involved in diplomatic and social duties, he completed his major philosophical treatise, *De Veritate (On Truth)* and, encouraged by Hugo Grotius and Daniel Tilenus, had it printed in Paris in 1624. During that year he was recalled to England and dismissed, probably because his sensible advice to the king was disliked. James I and Charles I failed to reimburse Herbert for the debts that he incurred while ambassador, seeking to satisfy him with titles, first with the Irish peerage of Castle Island in 1624 and then with the barony of Cherbury in 1629. In fruitless attempts to regain royal favour he wrote two historical studies, the first an attempt to vindicate Buckingham's expedition to the Île de Rhé and the other a deservedly respected study of the reign of Henry VIII (both published posthumously, in 1656 and 1649 respectively).

In 1639 Herbert attended the King at Alnwick and in 1640 argued in the Council against a peace treaty with the Scots. Thereafter, however, although his sons served on the royalist side, Herbert's own main aims seem to have been to preserve his property and to continue his studies. In 1644, under threat that his library in London would be seized, he surrendered Montgomery Castle to Parliamentary forces. He moved to London and was given a pension by Parliament. In 1645 he published a revised and enlarged edition of *De Veritate*, copies of which often include his *De Causis Errorum (Concerning the Causes of Errors)* and other pieces, a collection that was also published separately in the same year. In 1647 he visited Pierre Gassendi in Paris. On his deathbed he asked Archbishop Ussher, an old friend, to bring him the sacrament but his request was made in a less than wholly reverential way. Ussher consequently refused and Herbert died in London on 5 August 1648.

2 Metaphysics

Although respected, as well as criticized, by Grotius, Gassendi, Descartes and Locke, Herbert of Cherbury's work has largely been neglected since the beginning of the eighteenth century. This is partly because of the mixture of notions that provide the background to his insights (as well as being widely read in classical works, scholastic literature and works of Renaissance Humanism, he was influenced by Hermetic notions of universal harmony to the extent of suggesting a 'judicial' use of astrology), partly to a lack of order and precision in developing his ideas, and partly to the fact that his work does not allow historians of thought to fit him easily into some school or

pattern of development. If, however, he is to be linked to any contemporary intellectual tradition, it probably should be to that of seventeenth-century Platonism (see Cambridge Platonism; Platonism, Renaissance). Herbert himself, however, was not interested in either supporting or rebutting the views of others. While he culled his ideas from a wide range of sources, he regarded himself as an independent thinker who philosophized 'freely' (*libere*) and who considered 'right reason' (*recta ratio*) as the only authority, although, as Gassendi points out, in some respects his originality may lie more in his terminology than in the content of his thought.

The primary aim of Herbert's philosophical and theological works is well expressed in the full title of his pioneering study *De Veritate, Prout Distinguitur a Revelatione, a Verisimili, a Possibili, et a Falso (On truth in distinction from revelation, probability, possibility, and error)*. His intention in this work is not to develop a new doctrine but to clarify the meaning of 'true' and to determine how any normal person may identify what is true. His method is to assert the canon of 'right reason' in contrast to the appeal to supposed authorities that characterized the religious disputes of his time. Although he sometimes suggests that the assertion of the ultimate status of reason may be justified by reference to God's creative benevolence and overall providence, on the whole he simply presupposes that reason is the indisputable final judge of what is true. He is aware, however, that people differ about what is true. Hence, while he holds that people should trust their own natural instinct (*instinctus naturalis*), he also asserts that their findings should be tested against the standard of universal consent since this is, for him, a sure and available criterion for determining what reason perceives to be true.

Herbert's understanding of how we grasp the truth is based on a doctrine of the faculties. According to his thesis, all people possess a vast number of potential faculties, each of which is 'an internal power of the mind' that corresponds to a differentiable object, whether intellectual or physical, and provides a distinct way of perceiving it. Truth is accordingly defined in relational terms as conformity between objects and their appropriate faculties. Human knowledge of the truth is consequently limited by the range of the available 'faculties' but the existence of a 'faculty' is held to show the existence of a corresponding object. Agreement about what can be known to be true and how it may be so known thus depends upon determining the range, character and proper application of the 'faculties'. This is what Herbert investigates in *De Veritate*, distinguishing between four classes of truth (truth of things as they are in themselves, of the appearance of things, of conceptual distinctions, and of judgments about the correctness of the deliverances of the faculties) and attempting to identify the conditions for the perception of what is true in each class.

Herbert's doctrine of the 'faculties' means that, whereas Locke was to suggest that ideas of objects are basically the product of passive experiences, and whereas Kant's 'critical' revolution was to maintain that objects as known are fashioned by our modes of cognition, Herbert presented a third alternative, namely that there is a fundamental correspondence between what is actually the case and our latent modes of apprehension (see Kant, I. §§4-6). He thus puts forward what may be described as a 'common sense' view of 'truth' according to which the mind has an active role in grasping the reality of what it 'truly' apprehends. In this way, then, Herbert rejects on the one hand the view that the mind is a clean sheet or *tabula rasa* on which objects make their own impressions and which, consequently, receives its ability to deal with objects from objects themselves; on the other hand he accepts the principle that nothing is in the intellect which has not first been in the senses, provided that it is also appreciated that the mind deals with its experiences according to the structures prefigured by the 'faculties'. Contrary to what Locke may suggest, what are innate for Herbert are not propositions but the 'faculties' as pre-established potential modes of thought. The harmonious world system, however, entails that the interaction of the faculties with experiences produces true understanding of reality. Furthermore, Herbert claims that people are so constituted that what he describes as 'the common sense of the inner senses' is only satisfied when the 'faculties' are correctly adjusted to what they are seeking thereby to know. When, therefore, they attempt to apprehend something by what is not the correct corresponding 'faculty', Herbert holds that they experience a particular kind of corrective sensation which tells them that they are falling into error.

As well as holding that a person feels when the correct faculty is not being used to apprehend something, Herbert also maintains that among the intellectual objects represented by the faculties are certain fundamental 'common notions'. These are normative principles implanted by God in every person to ensure that they can distinguish what is true and good from what is false and bad. Accordingly they are to govern understanding and action. Since they are apprehended by natural instincts, they are found in every normal person. The six characteristic qualities of the common notions are *prioritas*, *independentia*, *universalitas*, *certitudo*, *necessitas* and *modus conformationis*

(priority, independence, universality, certainty, necessity - in the sense of being required for human preservation, and immediacy -in that they do not need to be warranted by discursive reasoning). What is *common* about the 'common notions' is that they are latently present in the mind of every person. Individuals only explicitly apprehend them when their minds have been suitably stimulated. Once they have become aware of them, however, normal people everywhere immediately recognize them to be true.

3 Views on religious belief

According to Herbert, certain 'common notions' provide the proper basis for judging what is true in matters of religious belief, including claims about what is held to have been divinely revealed. In *De Veritate* he discusses five 'common notions' that, in his judgment, constitute the foundation of and norm for the true Catholic or universal Church that is the only source of salvation. They are:

1 Some supreme deity exists
2 This supreme deity ought to be worshipped
3 Virtue joined with piety… is and always has been held to be the principal part of religious practice
4 Vices and crimes must be expiated by repentance
5 There is reward or punishment after this life

Herbert does not deny that some truths may have been revealed by God, including ones that may in principle be discovered naturally. He insists, however, that care must be taken to make sure that any alleged revelation is authentic and, furthermore, that no alleged revelation can be regarded as authentic if it contradicts (rather than reasserts or augments) what is laid down in the 'common notions' of religion.

In *De Religione Laici* Herbert develops his understanding of the common notions 'divinely transcribed in the mind itself' to hold that any lay person may, can and should decide between rival systems of religious belief by determining, through the use of reason, which set of doctrines and practices is the closest to those implied by the 'common notions'. Moreover, where beliefs involve claims about what happened in the past, they cannot escape the uncertainty that belongs to all such claims. As for the authority of the Bible, Herbert maintains that each individual has the right to judge the significance of its contents and to accept as 'the very Word of God' needed for salvation only those parts which agree with 'our Catholic Truths, which are like indubitable utterances of God, and matters recorded in the inner court' - by which he means the truths that are contained in the 'common notions' and, as such, that are engraved in the conscience by providence. The products of priestcraft are similarly to be subjected to these criteria. Herbert, however, does not see such an approach to doctrines and practices as hostile to authentic religion, but as upholding it.

While Herbert's views raise questions about unwarranted (and unwarrantable) claims to divine revelation and about the perversion of authentic religion by priestcraft, and while he proposes 'right reason' as the way to determine what is to be believed, it is misleading to describe him (as is widely done) as 'the father of English Deism' (see Deism). Herbert's own remarks and religious practice suggest that he was convinced not only of the actuality of God but also of the gracious activity of God in the lives of individuals, of the possibility of divine revelations, of the efficacy of prayer and of the reality of personal immortality. Moreover, there is little evidence that he was a significant influence on others given the unclear and confusing title of 'deists', despite his treatment as the first English 'deist' in early attacks on 'deism' by Thomas Halyburton (1714), Philip Skelton (1749) and John Leland (1754) in confessedly apologetic works which have provided the basic canon for later studies of this aspect of religious thought in the late seventeenth and eighteenth centuries.

4 Other religions

Two principles guide Herbert's approach to the various religions of the world. The first is his conviction that universal providence is the highest attribute of God. Hence God's benevolence must be regarded as concerned for all people, and salvation as available to all. The second is the need to show empirically that the 'common notions' of religion are indeed universally recognized.

Herbert meets the first principle by holding that atonement for sin is obtained through repentance. This means that neither a believing response to a particular event (such as the death of Jesus as the Christ) nor assent to a particular set of doctrines nor the fulfilment of prescribed rites is necessary for a person to be saved. The knowledge of what

is necessary for salvation is, always has been and always will be available to all people since it is contained within the 'common notions' of religion. Thus God does not unfairly limit saving knowledge to only part of humankind. The providential grace of God extends to all.

The second principle is met by arguing, both in *De Religione Gentilium* and in *A Dialogue between a Tutor and his Pupil*, that, in spite of what the evidence of the doctrines and practices of the world's faiths may seem to indicate, all people do basically recognize the 'common notions' of religion. Herbert deals with apparent evidence to the contrary in three ways. First, he suggests that some reports about the beliefs and practices in other religions have simply been misunderstood, particularly because of ambiguity in the language used. Second, he holds that sometimes symbolic usages have been misinterpreted as literal references. Third, he admits that some doctrines and rites found in other faiths do conflict with the 'common notions' of religion, but only because they have been corrupted by priestcraft. Priests are charged with distorting and perverting religion for their own selfish advantage. Herbert thus maintains that both in principle and practice the religions of the world fundamentally support his understanding of the actuality of the universal providence of God, and that the basic truths of religion are found in the non-Christian religions.

List of works

Herbert, Edward, Baron of Cherbury (1624) *De Veritate, Prout Distinguitur a Revelatione, a Verisimili, a Possibili, et a Falso (On Truth in Distinction from Revelation, Probability, Possibility, and Error)*, Paris; 3rd edn, London, 1645; partial trans. M.H. Carré, Bristol: University of Bristol, 1937; repr. London and Kinokuniya, Tokyo: Routledge/Thoemmes Press, 1992.(Written in a somewhat unusual Latin and completed while Herbert was ambassador in France, this seeks to identify 'the common nature of the search for truth which exists in every normal human being'. The revised edition of 1645 is best.)

Herbert, Edward, Baron of Cherbury (1645) *De Causis Errorum: Una cum Tractatu de Religione Laici, et Appendice ad Sacerdotes, nec non quibusdam Poematibus (Concerning the Causes of Errors: with a Treatise on the Religion of the Laity, and a Supplement to Priests, also certain Poems)*, London, 1645; ed. and trans. H.R. Hutcheson as *Lord Herbert of Cherbury's De Religione Laici*, New Haven, CT: Yale University Press, 1944.(Copies of the 1645 London edition of *De Veritate* often also contain this work which was also published separately. The Hutcheson translation contains a useful discussion of Herbert's life and thought and a bibliography.)

Herbert, Edward, Baron of Cherbury (1649) *The Life and Raigne of King Henry the Eighth*, London, 1672. (Written between 1632 and 1639, this was long regarded as the standard history of the reign.)

Herbert, Edward, Baron of Cherbury (1656) *Expeditio in Ream Insulam (The Expedition to the Island of Rhé)*, ed. and Latin trans. T. Baldwin, London; original English text ed. Lord Powis, London: Philobiblon Society, 1860.(Completed in 1630, this attempts the difficult task of justifying the conduct of the Duke of Buckingham as leader of an unsuccessful attempt to relieve the Hugenots in La Rochelle in 1627.)

Herbert, Edward, Baron of Cherbury (1663) *De Religione Gentilium (On the Religion of the Heathens)*, ed. I. Vossius, Amsterdam; trans. W. Lewis as *The Antient Religion of the Gentiles*, London, 1705.(Attempts to show that the basic truths of religion are found, albeit sometimes using indirect modes of expression, in non-Christian religions. To date the only English translation is that by Lewis.)

Herbert, Edward, Baron of Cherbury (1764) *The Life of Edward Lord Herbert of Cherbury written by himself*, Strawberry Hill; ed. with notes, appendices and later life, S.L. Lee, London, 1886; ed. with notes, J.M. Shuttleworth, London: Oxford University Press, 1976.(This pioneering work in autobiography (it stops at 1624) is amusing, sometimes frivolously teasing, as well as informative. The edition by Lee includes a useful addition that covers his life after 1624; Shuttleworth takes account of Herbert's corrections and notes significant variant readings.)

Herbert, Edward, Baron of Cherbury (1768) *A Dialogue between a Tutor and his Pupil*, London.(Authorship disputed, but probably at least largely by Herbert. Seeks to show that basic religious truths are recognized by all religions in spite of corruptions due to priestcraft.)

Herbrand’s theorem

According to Herbrand’s theorem, each formula F of quantification theory can be associated with a sequence F_1, F_2, F_3,... *of quantifier-free formulas such that F is provable just in case* F_n *is truth-functionally valid for some n. This theorem was the centrepiece of Herbrand’s dissertation, written in 1929 as a contribution to Hilbert’s programme. It provides a finitistically meaningful interpretation of quantification over an infinite domain. Furthermore, it can be applied to yield various consistency and decidability results for formal systems. Herbrand was the first to exploit it in this way, and his work has influenced subsequent research in these areas. While Herbrand’s approach to proof theory has perhaps been overshadowed by the tradition which derives from Gentzen, recent work on automated reasoning continues to draw on his ideas.*

Herbrand’s theorem says that each formula *F* of quantification theory can be associated with a sequence $F_1, F_2, F_3, \ldots$ of quantifier-free formulas such that *F* is provable just in case F_n is truth-functionally valid for some *n*. If *F* is prenex - that is, consists of a quantifier-free matrix *G* preceded by a string of quantifiers - then each F_i will be a disjunction of instances of *G* obtained by substituting terms for free variables. To simplify the exposition we consider only prenex formulas *F*. With each such *F* we can associate an existential formula F^H as follows: (1) substitute new constants for the free variables of *F*; (2) remove each universal quantifier $\forall x$ and replace the resulting free occurrences of *x* by a term $f(y_1, \ldots, y_m)$, where *f* is a new function symbol and $y_1, \ldots, y_m$ are all the variables bound by existential quantifiers to the left of $\forall x$ in *F*. For example, applied to $\forall x \exists y \forall z R(x, y, z)$ (with *R* quantifier-free) this procedure yields $\exists y R(c, y, f(y))$.

Although Herbrand would not have described their relationship in these terms, F^H can be said to express the meaning of *F* in the sense that *F* is true under an interpretation $\mathbb{I}$ just in case F^H is true under any expansion of $\mathbb{I}$ to the new constants and function symbols in F^H. To see this, consider our example. Let α, β range over the domain of $\mathbb{I}$, ϕ over functions on this domain and let ‘ x_α’ indicate that the value α is assigned to the variable *x*. Then the following are equivalent:

$\forall x \exists y \forall z R(x, y, z)$ is true under $\mathbb{I}$.
There is no α such that for all β $\exists z \neg R(x_\alpha, y_\beta, z)$.
There is no α and no function ϕ such that for all β $\neg R(x_\alpha, y_\beta, z_{\phi(\beta)})$.
For every α and every function ϕ there is some β such that $R(x_\alpha, y_\beta, z_{\phi(\beta)})$.
No matter which individual α is chosen to interpret *c* and which function ϕ to interpret *f*, $\exists y R(c, y, f(y))$ is true under $\mathbb{I}$.

This means, in particular, that *F* is true under every interpretation iff F^H is; the latter is called the validity functional form of *F*.

We can use the functional terms appearing in F^H to generate a series of finite domains $\mathbf{D}_i$. These will consist of constants which can themselves be substituted into the quantifier-free matrix G^H of F^H. For convenience, let $\mathbf{D}_1$ consist of a single constant *d*, $\mathbf{D}_2$ of a distinct constant (its ‘denotation’) for each term obtained from one occurring in G^H by substituting *d* for its free variables; in particular, constants occurring in G^H are assigned denotations in $\mathbf{D}_2$. In general, $\mathbf{D}_{n+1}$ consists of distinct denotations for each term obtained from one occurring in G^H by substituting members of $\mathbf{D}_n$ for its free variables. F_n, the Herbrand expansion of *F* of order *n*, is a disjunction whose disjuncts represent all possible ways of substituting members of $\mathbf{D}_n$ for the variables of G^H and replacing functional terms, where possible, by their values in $\mathbf{D}_n$. For example, if we allow each closed term to denote itself, then the first three domains generated by our earlier formula will be $\{d\}$, $\{d, c, f(d)\}$ and $\{d, c, f(d), f(c), f(f(d))\}$. The Herbrand expansions of orders 1, 2 and 3 are:

$$R(c, d, f(d))$$
$$R(c, d, f(d)) \vee R(c, c, f(c)) \vee R(c, f(d), f(f(d)))$$
$$R(c, d, f(d)) \vee R(c, c, f(c)) \vee R(c, f(d), f(f(d))) \vee R(c, f(c), f(f(c))) \vee R(c, f(f(d)), f(f(f(d)))).$$

Notice that F_n is not an interpretation of the quantifiers of F^H in $\mathbf{D}_n$ in the usual sense because some of the

terms occurring in F_n only acquire a denotation in $\mathbf{D}_{n+1}$.

Now, for provable *F*, Herbrand showed how to compute a number *n* such that F_n would be a tautology. He argued by induction on the proof of *F*. The only axioms in his system are the quantifier-free tautologies, so his method is to analyse each rule of inference and show how the order of a tautologous expansion of its conclusion can be calculated from the order(s) of such expansions of its premises. Conversely, he showed how to construct a proof of *F* from any tautologous F_n. Because the only rules required here are forms of generalization and simplification (in particular, *modus ponens* is not used), this yields a normal form for proofs in quantification theory analogous to Gentzen's cut-elimination theorem and lends itself to many of the same applications. It allows a bound to be placed on the complexity of formulas appearing in a normal proof depending on the complexity of its conclusion (and assumptions, if any).

Herbrand's proof contains ideas of great interest but, in contrast to Gentzen's, it is not easily adapted to non-classical systems. Furthermore, it is difficult to follow and turns out to contain a defect. Although this has been repaired by Dreben and his collaborators, the proof has not been reproduced and nowadays the theorem (for prenex formulas only) is often established as a corollary to a refinement of the cut-elimination theorem. (Since a cut-free proof of a prenex formula can be separated into a truth-functional and a quantificational part, by working back from the conclusion we can discover a truth-functionally valid formula from which it follows.)

While he accepted set-theoretic arguments in mathematics, Herbrand was committed to using finitary methods in metamathematical investigations. His work was influenced by Löwenheim (1915), but he rejected the naïve notion of satisfiability in an infinite domain the latter assumed. In fact, Herbrand claimed that his result was just a more rigorous version of Löwenheim's famous theorem to the effect that a sentence is satisfiable if and only if it is satisfiable in a denumerable domain. It would be more accurate, however, to describe it as a finitist variant thereof. To understand why this is so, notice that we can reformulate Herbrand's theorem using a construction dual to the above. We remove existential quantifiers from *F*, replacing the newly freed variables by functional terms to obtain a universal formula (the satisfiability functional form of *F*), which can then be expanded as a series of finite conjunctions F'_n over the $\mathbf{D}_n$. The theorem then states that *F* is irrefutable iff F'_n is truth-functionally satisfiable for every *n*. (This is the original theorem expressed as a criterion for the non-provability of $\neg F$.) Constrained by his finitist scruples, Herbrand explicated validity in terms of provability and, *a fortiori*, satisfiability in terms of irrefutability. He also suggested that *F*'s having truth-functionally satisfiable expansions F'_n for every *n* could serve as a constructive account of what it means for *F* to be satisfiable in a (denumerable) domain. Replacing the informal set-theoretic notions in the statement of Löwenheim's theorem by their finitist analogues transforms it into a statement of Herbrand's theorem - even though the theorems themselves remain distinct.

Herbrand's ideas have yielded numerous metamathematical applications. The normal form for proofs mentioned above supplies a tool for obtaining consistency proofs. Furthermore, the elimination of quantifiers in favour of functional terms suggests how to exhibit the constructive content of the theorems of a formal theory - as in the 'no counterexample' interpretation of arithmetic, for example (Kreisel 1951). Herbrand's theorem also allows us to prove a theory consistent by approximating a model for it, that is, by establishing that, for every (finite) conjunction *F* of the theory's axioms, F'_n is truth-functionally satisfiable for every *n*. Herbrand himself gave a consistency proof for a fragment of arithmetic along these lines, and his methods have been extended to yield proofs for the full system (see Dreben and Denton 1970, Scanlon 1972). These proofs, while no less complex than Gentzen's, yield directly the sort of constructive interpretations alluded to above.

Finally, Herbrand's theorem supplies an approach to the decision problem for classes of quantificational formulas, that is, to discovering an algorithm which, for any formula in the class, computes whether or not it is satisfiable. The idea here is to investigate the relationship between syntactic properties of quantificational formulas and the structure of their expansions, and to discover properties of the latter which ensure the existence of a decision procedure (see Dreben and Goldfarb 1979). His theorem and the methods introduced in its proof are relevant not only to theoretical decidability results, but also to the design of implementable automated reasoning procedures. These employ unification algorithms to improve the efficiency of testing quantifier-free expansions for satisfiability, and Herbrand is credited with being the first to devise such an algorithm (Snyder 1991).

Herder, Johann Gottfried (1744-1803)

Herder was a central figure in the German intellectual renaissance of the late eighteenth century. His achievement spanned virtually every domain of philosophy, and his influence, especially upon Romanticism and German idealism, was immense. In social and political philosophy he played a prominent role in the development of historicism and nationalism. In metaphysics he developed the doctrine of vitalist pantheism, which later became important for Goethe, Schelling and Hegel. In the philosophy of mind he formulated an organic theory of the mind-body relationship, which was crucial for Schelling and Hegel. And in aesthetics he was among the first to defend the value of ethnic poetry and the need for the internal and historical understanding of a text.

Herder's main aim was to extend the powers of naturalistic explanation to the realm of culture, so that characteristic human activities, such as art, religion, law and language, could be included within the scientific worldview. But he also wanted to avoid reductivistic forms of explanation that viewed such activities as nothing more than matter-in-motion or stimulus-response mechanisms. He insisted that explanation in the cultural sphere had to be holistic and internal as well as mechanical and external. An action had to be understood in its historical context and according to the intention of the agent and not simply as another instance of a causal regularity between events. Herder's programme, then, was to develop naturalistic yet non-reductivistic explanations for the realm of culture. He attempted to realize this programme in many spheres, especially language, history, religion and the mind.

1 Intellectual ideals and background

Born into a middle-class family in Mohrungen, East Prussia, Herder spent most of his life as a Lutheran pastor in the provincial cities of Riga, Bueckeburg and Weimar. Herder's intellectual development was dominated by one central fact: during his formative university years in Königsberg from 1762 to 1764, he was the student of both Kant and Hamann. To the same degree, they were a profound influence upon him. But such a rich legacy also proved problematic, for Kant and Hamann represented opposing intellectual movements. While Kant was a champion of the *Aufklärung*, the German Enlightenment, Hamann was a founder of the *Sturm und Drang* (lit.: Storm and Stress), the German literary movement of the 1760s and 1770s that proclaimed personal freedom and glamorized revolt. Although these movements had some common values - individual emancipation, the essential goodness of human nature, contempt for aristocratic privilege and clerical prejudice, hatred of superstition and intolerance - they also had some conflicting ones. The *Aufklärung* stressed the sovereignty of reason, the value of the arts and sciences, and the virtues of cosmopolitanism; the *Sturm und Drang* emphasized the rights of feeling and imagination, the problems of civilization, and the value of local and ethnic identity. Herder struggled to reconcile these opposing ideals. His philosophy could be described as a rich synthesis - or unstable mixture - of these antithetical movements. We might best describe Herder with oxymorons: a turbulent *Aufklärer*, a rational *Stürmer und Dränger*.

What, more specifically, did Herder learn from Kant? All his life Herder adhered to the young Kant's conception of the aim and method of philosophy: its purpose is to develop intellectual autonomy; and its method should be 'analytic', beginning from experience and ascending to general principles. In his later works Herder applied these early Kantian ideals -much to the chagrin of the mature Kant, who regarded them as a relapse into metaphysical dogmatism. Of all Kant's works Herder was most influenced by the *Allgemeine Naturgeschichte und Theorie des Himmels (Universal Natural History and Theory of the Heavens)* (1755). This work was important for Herder for two reasons: (1) its idea of a natural history, that the apparently eternal and static structure of nature is really the product of historical development; (2) its suggestion that human beings are part of nature and also have a natural history. Herder's historicism arose from his application of Kant's idea of natural history to the social, religious and historical spheres.

What, more precisely, did Hamann teach Herder? There were many influential ideas: the value of cultural diversity, the vitality of folk poetry, the power of the passions, the importance of language for reason and of custom for language, and the need to examine the social and historical context of reason. Hamann also impressed upon Herder the limitations of the *Aufklärung*: that religious experience cannot be criticized by reason, that the mind-body relationship is inexplicable by mechanism, and that human beings are indivisible wholes not neatly

analysed into faculties.

The guiding ideal behind Herder’s intellectual development was a synthesis of Kant and Hamann. Throughout his career Herder’s aim was to develop naturalistic and historical explanations for characteristic human activities, such as art, religion, language, law and morality. He wanted to extend the powers of natural explanation, so that all forms of humanity would be brought within the scientific worldview. In this regard he revealed himself as a loyal follower of Kant and the *Allgemeine Naturgeschichte*. Yet there was something unique about Herder’s programme that broke from the heritage of Kant and the *Aufklärung*. Herder insisted that naturalistic explanations do not reduce human activities to matter-in-motion or stimulus-response mechanisms. His critique of mechanism, and his demand for a more holistic and internal form of understanding, betrays the influence of Hamann. Herder’s programme for naturalistic yet non-reductivistic explanation attempted to do justice to the legacy of both Kant and Hamann. We shall now see how Herder attempted to fulfil this programme in virtually every field of philosophy.

2 Theory of language

In 1769 the Berlin Academy of Sciences announced a prize competition for the best essay on the questions ‘If human beings were left with their natural faculties, would they be able to invent language? And, if so, by what means could they invent it?’ Competitors were invited to disagree with a late member of the Academy, J.P. Süssmilch, who argued that a perfect and complete language could have only a divine origin. This quaint question raised an important and broader issue: to what extent is reason, which depends on language, explicable according to natural laws? Should human intelligence be brought within the scientific worldview?

Inspired by the question, Herder wrote a short tract to answer it in December 1770, *Ueber den Ursprung der Sprache (On the Origin of Language)*. This marks the starting point of his philosophical programme, the attempt to provide naturalistic yet non-reductivistic explanations of characteristic human activities. Herder takes a firm stand on behalf of naturalism, dismissing Süssmilch’s theory as so much nonsense. He puts forward two specific theses, each of which is necessary to prove his naturalism. (1) Human reason is sufficient to create language. Since, however, reason itself might have a supernatural or divine origin, he adds a second thesis. 2) The use of reason is natural and necessary because it is the means by which human beings acquire the skills and information necessary for survival. Hence if reason is sufficient to create language, and if its use is natural, then the creation of language will be natural too.

To defend his first thesis, Herder argues that the function of reason is to direct, control and organize our experience. Such a function involves what he calls ‘reflection’ (*Besonnenheit*), the capacity to be selfconscious of our sensations by identifying or remembering them. We can exercise this capacity only by giving signs to specific features of experience; only through the use of signs are we able to identify, remember and control our sensations. In employing signs, though, we have already created language.

To support his second thesis Herder develops a proto-Darwinian account of why reason, and indeed language, is necessary for survival. Since men, unlike animals and insects, do not have instincts to guide them, they must learn how to survive. If each new generation is not to be exposed to the same dangers and perils as past ones, its ancestors must teach them the skills and facts necessary for survival. The most effective means of doing so is, of course, language.

The aim of Herder’s tract is not simply to develop a naturalistic theory of the origin of language. That had been done before by such eminent thinkers as Rousseau and Condillac. Herder’s specific aim is to develop a naturalism that is not reductivist. He rejects the theories of Rousseau and Condillac precisely because they were reductivist, failing to explain the characteristic functions of human reason. In his second *Discours* (1755) Rousseau argued that language originates with the expression of feeling; the first words were cries or ejaculations (see Rousseau, J.-J. §2). In his *Essai sur l’origine des connaissances humaines* (1746) Condillac maintained that language begins with convention, the agreement between speakers about the referents of sounds (see Condillac, É.B. De §2). The purpose of language is to communicate; but people can do this only by agreeing about the meaning of sounds. Herder rejects Rousseau’s theory because it treats human beings as if they were animals, ignoring what is most distinctive about human language, its cognitive dimension. He dismisses Condillac’s theory for its circularity: primitive people cannot make conventions unless they already have a sophisticated concept of language. Both theories are inadequate because they do not consider the characteristic nature of man - reason. Either they reduce

reason to man's animal nature (Rousseau) or they assume it without explaining it (Condillac). Yet it is human rationality, Herder contends, that holds the key to the origin of language. Since men alone possess rationality, and since they also are unique in having language, we must seek its origin in their characteristic nature. That, Herder says, is the guiding assumption behind his whole investigation.

3 Philosophy of mind

In 1774 Herder wrote another treatise for an academic prize, his *Vom Erkennen und Empfinden der menschlichen Seele (On the Knowledge and Sensation of the Human Soul)*, which was eventually published in 1778. He again attempted to answer a question posed by the Academy of Sciences: 'What is the nature of, and relationship between, the two basic faculties of the soul, knowledge and sensation?' This question too raised a wider problem: the relationship between the mind (the source of knowledge) and the body (the source of sensation).

Herder began by criticizing some of the current theories about the mind-body relationship. In the late eighteenth century these usually took two forms: they were dualistic, making the mind into a special substance distinct from the body, or materialistic, explaining the mind as if it were a complicated machine. Herder rejects dualism because it makes the interaction of mind and body mysterious (see Dualism); and he dismisses materialism since it reduces the mind down to a mere stimulus-response mechanism (see Materialism in the philosophy of mind). What is required, he contends, is a theory that avoids both these pitfalls. It should remove the mystery of mind-body interaction while not reducing one to the other. In other words, it must be naturalistic yet non-reductivist. The main task of his tract is to sketch just such a theory.

The central thesis of Herder's organic or vitalist theory is that the mind and body are not heterogeneous substances, nor more or less complicated machines. Rather, they are simply different degrees of organization and development of a single living power. The essence of power consists in self-generating and self-organizing activity, which gradually develops from lower to higher forms of organization and structure. The difference in mind and body is therefore not in kind but only in degree: the mind is organized and developed, the body is amorphous and inchoate, power. Such a theory easily explains interaction since mind and body are both aspects of a single force; but it also does not reduce one to the other because they are different degrees of organization and development.

Herder develops his theory by questioning the fundamental premise behind both dualism and materialism: that matter consists in extension alone. It was this assumption that forced the dualist to separate the mind from the body and that compelled the materialist to reduce it to a machine. If, however, we reject this assumption, then we escape the whole dilemma between materialism and dualism. According to Herder, the latest work in the natural sciences permits us to do just this. The recent discoveries of electricity and magnetism, the phenomenon of irritability investigated by Albrecht von Haller, the concept of *vis viva* developed by Hermann von Boerhaave, and the critique of preformation by Thomas Needham and P.L. Maupertuis, all seem to show that the essence of matter is not extension but force, power or energy. In general, Herder stressed the importance of empirical research for the philosophy of mind. No psychology could succeed, he stressed, unless it followed physiology at every step.

4 Philosophy of history

The most influential aspect of Herder's thought was his philosophy of history, which laid the foundation for much of the historicism of the nineteenth century. He developed his philosophy of history in two main works, *Auch eine Philosophie der Geschichte der Menschheit (Another Philosophy of History of Humanity)* (1774) and *Ideen zur Philosophie der Geschichte der Menschheit (Ideas for a Philosophy of History of Humanity)* (1784-91).

Crucial for the development of Herder's historical thought was his 'genetic method', which he first sketched in his *Fragmente* (1767). This was originally conceived as a method for the proper understanding of a work of literature; but Herder eventually extended it to all human actions and creations. This method consists in two basic principles. (1) To understand an action or creation, it should be seen within its historical context, as the product of a specific time and place. (2) It is necessary to understand the action or creation from within, according to the intention of the agent or creator, and not merely from without, according to its external causes or some purported universal rules. With the first guideline Herder attempted to satisfy the demand for natural explanation; he was applying the general lesson he had learned from Kant's *Allgemeine Naturgeschichte*, that what appears given and eternal is

really the product of history. With the second guideline he stressed the need for non-reductive explanation. Here Herder's immediate target was those literary critics who attempted to evaluate a work according to their own standards without attempting to grasp the purpose of the author.

In his *Auch eine Philosophie der Geschichte* Herder criticized the historiography of the *Aufklärung* and stressed the importance of an internal understanding of the past. The historians of the *Aufklärung*, he claimed, were guilty of ethnocentrism. They judged the past and alien cultures in the light of their own, as if the values of their age are universal and eternal and the very end of history itself. They failed to judge each epoch in its own terms, according to its own values and ideals. If the historian is to comprehend an alien culture or epoch, then he must suspend his preconceptions and feel himself into the standpoints of the agents themselves. In this regard Herder was one of the first to stress the need for a more sympathetic understanding of the Middle Ages, which had been dismissed as an age of darkness, superstition and fanaticism.

Herder's critique of Enlightenment historiography raises the question whether he is admitting, or even advocating, relativism. In several places of his tract he openly states that the values of different cultures are incommensurable, and that each culture is valid in its own terms. Indeed, he argues that the apparently universal and eternal standards of the *Aufklärung* are really only invalid generalizations from their own age.

Nevertheless, despite his flirtations with cultural relativity, Herder was anxious to claim that there are some universal values in history. In an early fragment - *Von der Verschiedenheit des Geschmacks und der Denkart unter den Menschen (On the Difference in Taste and Thinking among Human Beings)* (*c*.1765-8) - he reveals a deep concern to refute sceptical arguments for cultural relativism. In the 1774 tract, he expressly maintains that his aim is to show how, amid all the diversity of cultures, there is still 'progress in a higher sense' and how 'humanity still remains humanity'. Herder's aim, then, was to find some middle path between ethnocentrism and relativism. A closer reading of the 1774 tract indeed shows that Herder stresses the individual worth of each culture not because all values are relative but because each has the value appropriate to humanity *at that stage of its development*. In other words, cultures have *sui generis* values because what is appropriate for a lower stage of development is not so for a higher, just as what is good for a child is not so for an adult. This is not relativism but the very opposite: the belief that all cultures can be graded on a scale of progress and development. There remains in Herder's philosophy of history, then, a profound teleological dimension, an abiding belief in progress and providence. In the 1774 tract, however, Herder is reluctant to identify the goal of history. Such hesitation is understandable, given that any specific definition invites ethnocentrism.

Herder's main work in the philosophy of history is his massive, but still incomplete *Ideen*, which appeared in instalments from 1784 to 1791. It consists in four parts. The first two discuss natural history, human anatomy and anthropology. Only in the third part does Herder begin to treat recorded history, whose course is followed until the Roman Empire. The fourth part continues the history to 1500 AD. The fifth part, which was to conclude with the present age, was never written. Conceived on a grand scale, the *Ideen* attempts to examine all of world history, giving equal weight to the cultures of Egypt, China, India and Greece, and the place of humanity within the cosmos.

The *Ideen* was the crowning work of Herder's philosophical programme. Its aim was to bring human history within the naturalistic worldview. Herder wanted to see history as part of the cosmos as a whole, and to formulate its natural laws. But his naturalism was, again, non-reductivist. He conceived the laws of historical development in organic rather than mechanical terms. For Herder, to explain a culture naturalistically meant to see it as an organism, having a purpose and stages of growth.

The first books of the *Ideen* begin with a grand survey of the whole order of nature. Herder locates the place of the earth in the solar system, then the place of man on earth. Following his dynamic view of matter, he sees all of nature as a hierarchy, as so many stages of organization and development of living force. At the summit is man, the culmination of all the powers of nature. It is a central claim of the *Ideen* that there is no distinction between the realms of culture and nature. A culture is portrayed as a continuous development from nature, a unique adaption to specific natural circumstances, such as terrain and climate. Human rationality is also placed within this naturalistic framework. It is seen as the tool by which man learns the skills and information necessary for survival.

The foundation of Herder's concept of history is his anthropology, which he sketches in the first two parts. Herder

stresses that the characteristic feature of mankind is plasticity, the ability to adapt to the most diverse circumstances. While an insect or animal can live in only a specific climate and terrain, mankind can live almost anywhere upon earth. This plasticity also means that a person is shaped by society. Reason, feeling and volition are determined by education, by assimilating a cultural tradition. With this anthropology, Herder broke with the assumptions of a universal human nature, which were so endemic within the seventeenth and eighteenth centuries.

Although he stresses human plasticity, the formative role of culture and nature in shaping our identity and rationality, Herder again refuses to draw relativistic conclusions. As in the 1774 tract, he maintains that there is a single goal to world history, which each culture attempts to realise in its unique way. Now, however, he is more explicit about the nature of this goal. It is what he calls 'humanity' (*Humanität*). This is Herder's ideal of human perfection, the realization of all characteristic powers, the development of reason, feeling and will into a harmonious whole. Such a vague concept was, however, a mere stopgap against relativism. Although he tries to avoid it, Herder faces the dilemma of relativism or ethnocentrism. If he defines his ideal more specifically, he invites the danger of ethnocentrism; but if he leaves it general and abstract, different cultures can realise it in incompatible ways.

The reception of the *Ideen* was marked by controversy. The first two parts were harshly reviewed by Kant, who saw his erstwhile pupil as a rival. Kant felt that Herder had refused to learn the main lessons of his new critical philosophy. He accused Herder of indulging in metaphysics, for there cannot be any empirical verification for the concept of an organic power. He also took strong exception to Herder's naturalistic conception of rationality, which threatened the noumenal/phenomenal dualism of the critical philosophy. Herder was not without his supporters, however, who wrote counter-reviews to Kant. He was defended by K.L. Reinhold, who later became a prominent spokesman for Kant, and Georg Forster, the German explorer and naturalist. This debate about the limits and validity of an organic concept of nature proved to be an important stimulus for Kant's *Kritik der Urteilskraft (Critique of Judgment)* (1790).

5 Metaphysics

Herder's most explicit statement of his general metaphysical views is his *Gott, Einige Gespräche (God, Some Conversations)*, which appeared in 1787. This work is essentially an attempt to rehabilitate Spinozism by interpreting it in organic or vitalist terms (see Spinoza, B. De). It is Herder's contribution to the famous 'pantheism controversy', which dominated German intellectual life in the late 1780s.

This controversy began in 1786 when Jacobi published his *Briefe über Spinoza (Letters on Spinoza)*. Jacobi argued that Spinozism ends in atheism and fatalism. Since he regarded Spinoza's naturalism as the paradigm of a rational or scientific worldview, he was in effect pointing out the dangerous consequences of reason or science for morality and religion.

Herder's tract was a defence of Spinoza, and indeed scientific naturalism, against Jacobi's criticisms. Herder agreed with Jacobi that Spinoza's philosophy represents the spirit of scientific naturalism; but he denied that it ends of necessity in atheism and fatalism (see Jacobi, F. §§2,4). Such a conclusion follows, he argued, only for Jacobi's very orthodox concepts of God and freedom. If we regard God as personal and supernatural, then Spinozism is indeed atheism, for Spinoza thinks that that God is the whole of nature. And if we assume that freedom involves the power of acting otherwise, then Spinozism is also fatalism, since Spinoza also holds that everything is determined to act of necessity. But, Herder insists, we should reject these concepts of God and freedom in the first place, which are nothing more than relics of mythology. To think of God as transcendent is to make him irrelevant to human concerns; and to ascribe personality to him is to anthropomorphize him, making the infinite merely finite. Like Spinoza, then, we should view God as immanent and impersonal, not as transcendent and personal. Similarly, freedom should be understood not as a mysterious power to act contrary to nature, but as 'acting according to the necessity of our own nature alone', just as Spinoza defines it. Given such an interpretation of the concepts of God and freedom, Spinozism does not undermine but supports morality and religion. Indeed, the great attraction of Spinozism for Herder, and many thinkers of his generation, such as Goethe, Schleiermacher, Hölderlin and Novalis, was that it seemed to reconcile science with religion and morality. Spinozism seemed to be the religion of science, the science of religion.

Herder's account of Spinozism ultimately rested upon his organic or vitalist conception of nature. Since naturalism

for Herder means organicism, he interprets Spinoza's naturalism too in vitalist terms. Accordingly, he sees Spinoza's God not as a static substance but as an active force, the force of forces or primal force. If God is such a living force, then, Herder thinks, we can attribute ends to his activity. This will salvage the concept of providence, removing any further traces of fatalism from Spinoza's system.

Of course, such an interpretation was hardly orthodox Spinozism. Although Spinoza had a dynamic view of substance, he banished teleology and understood explanation in purely mechanical terms. Herder has to admit, therefore, that he is transforming Spinoza more than interpreting him. But he insists that he is only trying to make Spinoza's naturalistic spirit consistent with the latest scientific research. All the results of its investigations - the new chemistry, the concepts of electricty and magnestism, Boerhaave's revival of *vis viva* - show that matter is not extension but force. Spinoza's mechanical conception of nature was simply the legacy of his Cartesianism and the physics of his day. If Spinoza were only alive today, Herder suggests, then he too would have an organic conception of God.

The net result of Herder's *Gott* was his vitalistic pantheism or pantheistic vitalism. Whether this was orthodox Spinozism was merely a side issue. By injecting life into Spinoza's static universe, Herder made Spinozism much more appealing for his generation. The revival of Spinozism in late eighteenth-century Germany is a flowering more of vitalistic pantheism than Spinozism proper. That vital pantheism has much of its roots in Herder's *Gott*.

6 Political thought

Although Herder was not a systematic political thinker, political issues were at the very heart of his concerns. His views are scattered in several writings, especially in various passages of his historical works. The first version of *Briefe, die Humanität betreffend (Letters concerning Humanity)*, written in 1792 but never published, examined the issues raised by the French Revolution.

Herder's most important contribution to modern political thought lay in his nationalism. Although he was not the first spokesman for this doctrine, he did play a prominent part in its formulation and transmission. The essence of Herder's nationalism is his model of government and political association. The foundation of both should be, in Herder's view, not a centralized state but the nation, the culture of a people. The people should be joined together by laws that express their common language, religion, customs and history. Their government should represent and defend, not repress or merely tolerate, their distinctive values and way of life.

Herder's nationalism arose from his profound dissatisfaction with the absolutist states of late eighteenth-century Europe, such as Prussia, Russia and Austria. These states held together people of the most diverse cultures by sheer political force, a centralized bureaucracy run according to the whim of the monarch. The cosmopolitan ideals of these states, Herder firmly believed, were often nothing more than a mask for their oppression. In making the nation rather than the state the basis of political order, Herder's motive was largely populist and democratic. He believed that a government based on the culture of a nation reflected the will of the people.

Although Herder was a pioneer of modern nationalism, his views differ from more recent versions in three fundamental respects. (1) Herder saw the nation as the alternative to, rather than foundation for, the centralized bureaucratic state. (2) He believed in the equal value of all cultures and despised all forms of chauvinism or jingoism. (3) Herder's concept of a nation (*Volk*) is based not on race but culture, whose essential component is language.

In wishing to replace the state with the nation, Herder sometimes leaned toward anarchism. He firmly believed that the people could govern themselves and that the modern state was a persistent threat to that right. The most noble end of the state, he wrote in a censored passage of the *Ideen*, is to become superfluous and disappear. His anarchist sentiments became especially apparent in his polemic against Kant in the *Ideen*. He flatly denies Kant's thesis that the purpose of history is to form a perfect state, insisting instead that its purpose is for the state to disappear. He also takes strong exception to Kant's statement that man is an animal in need of a master; in his view, the very opposite is the case: a man in need of a master is an animal.

Although Herder wanted to abolish the state, he never denied the need for some form of government. All that he opposed is the centralized, bureaucratic modern state. True to the Aristotelian tradition, he insisted that man is a political animal with a natural need for government. That some form of authority is necessary to bridle unruly

passions and to arbitrate disputes he fully recognized. He admitted the need, therefore, for written laws and a representative body to administer civic affairs. Yet the form such authority should take is local self-government, because that alone gives the people maximal opportunity to govern themselves about issues that affect them most. This belief in the value of local self-government appears in Herder's admiration for some of the old German city-states, such as Riga and Hamburg.

In the spectrum of late eighteenth-century German politics, Herder belongs firmly to the left wing. He admired the Revolution in France and embraced its ideals of liberty, equality and fraternity. Like many French radicals, he insisted upon the need for a broad franchise and the responsibility of the government to ensure a minimal standard of welfare and education for the people. All his life he had a contempt for the aristocracy and the royalty of the *ancien régime*. Yet Herder was no radical, still less a revolutionary. He became disillusioned with the Revolution after the execution of Louis XVI. His disillusionment stemmed not from any love for the monarchy, but from his hatred of the Jacobins, who, he rightly feared, wanted to establish another form of centralized bureaucratic state. Like many of his contemporaries, he stressed the need for more education and enlightenment as a precondition of social change.

Hermeneutics

Hermeneutics, the 'art of interpretation', was originally the theory and method of interpreting the Bible and other difficult texts. Wilhelm Dilthey extended it to the interpretation of all human acts and products, including history and the interpretation of a human life. Heidegger, in Being and Time (1927), gave an 'interpretation' of the human being, the being that itself understands and interprets. Under his influence, hermeneutics became a central theme of continental philosophy. Hermeneutics generates several controversies. In interpreting something do we unearth the author's thoughts and intentions, imagining ourselves in his position? Or do we relate it to a wider whole that gives it meaning? The latter view gives rise to the hermeneutic circle: we cannot understand a whole (for example, a text) unless we understand its parts, or the parts unless we understand the whole. Heidegger discovered another circle: as we inevitably bring presuppositions to what we interpret, does this mean that any interpretation is arbitrary, or at least endlessly revisable?

1 The beginnings of hermeneutics

The Greek *hermeneuein* means to express, explain, translate or interpret; *hermeneia* is interpretation and so on, often the interpretation of a sacred message. Plato called poets the *hermenes* - interpreters - of the gods. Philosophers interpreted Homer allegorically. Augustine interpreted the Old Testament as allegory, using Neoplatonic concepts and recording the rise of the soul above the literal and the moral senses of the text to its spiritual sense. Allegorical interpretation remained the norm throughout the Middle Ages. With the Reformation, especially in Germany, *hermeneia* became more explicit and systematic. The word *hermeneutica*, the 'art of interpretation', appeared in the title of J.C. Dannhauer's 1654 work *Hermeneutica sacra sive methodus exponendarum sacrarum litterarum*. Protestants had to interpret the Bible properly; they appealed to it against Roman Catholicism. They rejected allegorical interpretation and insisted on the letter of the text, hoping to retrieve its meaning from distortions introduced by the Church and by scholasticism. Biblical exegesis did not remain isolated from interpretation of other texts. Spinoza, in *Tractatus theologico-politicus* (1670 ch. VII: §94), affirmed that the 'standard of biblical exegesis can only be the light of reason common to all'. For Spinoza, biblical exegesis became biblical criticism, and this involved history. Since reports of miracles fall short of rational standards of belief, we must explain why the authors of the Bible and their contemporaries believed in miracles (see Spinoza, B. de §14).

Johann Ernesti declared in his manual of hermeneutics (1761: 7) that the 'verbal sense of Scripture must be determined in the same way in which we ascertain that of other books'. Other texts in need of interpretation were legal documents and the works of classical antiquity, and these disciplines also contributed to hermeneutics. Significant advances were made by two classicists, Friedrich Ast and Friedrich August Wolf. Ast, in *Grundlinien der Grammatik, Hermeneutik und Kritik (Elements of Grammar, Hermeneutics and Criticism)* (1808), distinguished different levels of understanding a text. The first is 'historical', establishing the authentic text by comparing different manuscripts and deploying knowledge of the history and other writings of the period; to this understanding corresponds the 'hermeneutics of the letter'. The second is grammatical, corresponding to the 'hermeneutics of the sense': we understand the meaning of the words and sentences in the text. The third is spiritual: we ascend from the literal meaning to the spirit (*Geist*) of the author and of their society ('spirit' means 'outlook', 'mentality' or 'worldview'; it need have no theological or psychological connotation). In his lectures on the 'encyclopaedia of classical studies' from 1785 to 1807, Wolf defined hermeneutics as the 'science of the rules by which the meaning of signs is discerned' (1831: 290). Its aim is to 'grasp the written or even merely spoken thoughts of someone else just as he would have them grasped' (1831: 293). This involves not only knowledge of the language of the text, but also historical knowledge, a knowledge of the author's life, of the history and geography of their country. An interpreter should ideally know everything known by the author. Wolf proposed many rules for handling problems of interpretation, but insisted that an interpreter needs a 'lightness of soul' that 'quickly attunes itself to foreign thoughts' (1831: 273). Knowing rules is not enough; we need a skill in applying rules which no rule can guarantee.

2 Schleiermacher

Friedrich Schleiermacher welded these partial theories into a single discipline, embracing the interpretation of all

texts, regardless of genre and doctrines (he interpreted Heraclitus and Plato as well as the Bible.) At each level of interpretation we are involved in a hermeneutical circle. We cannot know the correct reading of a passage in a text unless we know, roughly, the text as a whole; we cannot know the text as a whole unless we know particular passages. We cannot know the meaning of a word unless we know the meanings of surrounding words and of the text as a whole; knowing the meaning of the whole involves knowing the meaning of individual words. We cannot fully understand the text unless we know the author's life and works as a whole, but this requires a knowledge of the texts and other events that constitute his life. We cannot fully understand a text unless we know about the whole culture from which it emerged, but this presupposes a knowledge of the texts and so on that constitute the culture. Not only is there circularity within each level of interpretation, but also between levels. We cannot decide on the correct reading of a particular passage unless we already know something of its meaning and also of the author's life or culture. But how are we to acquire this knowledge, if not from such texts as this?

The hermeneutic circle is less mysterious than often supposed. A text need not be uniformly problematic. A hopelessly corrupt manuscript (or misprinted book) may be undecipherable. But if the manuscripts are reliable over the bulk of the text, the interpreter brings the knowledge of this part to bear on those parts where the manuscripts are corrupt. Not all words and sentences are equally obscure; the relatively transparent supply a clue to the relatively opaque. Again, understanding is a matter of degree. I cannot fully understand a text unless I fully understand each word and sentence, and I cannot fully understand any word or sentence unless I understand the whole. If full understanding and blank incomprehension were the only alternatives, I could not understand a text of any length or complexity. But understanding is not like that: I can roughly understand a text without fully understanding it, and rough understanding enables me to decipher particular parts.

In 1813 Schleiermacher wrote: 'Essentially and inwardly, thought and its expression are completely the same' (1959: 21). This suggests that what we understand is the literal meaning of a text, what the words mean or meant. In 1819 he wrote: 'The art can develop its rules only from a positive formula, and this is: the historical and divinatory, objective and subjective reconstructing of a given utterance' (1959: 87). This suggests that there may be more to an author's thought than the meaning of their words, and that the interpreter has to unearth the thought. The thought may differ from the meaning of the words for several reasons: authors may express themselves badly, a slip of the pen or the tongue, a lack of verbal facility or malapropism. (When someone speaks of 'mitigating against' or writes 'It is worth nothing that…', we assume that they meant 'militating against' and 'It is worth noting that…'.) To understand an utterance fully, we often go beyond the meaning of the words and ask about its author's intentions: Did the author mean it seriously or as a joke? Did they mean the word in this sense or in that? Was the author implicitly criticizing so-and-so? Conversely we may discern more in an author's words than we can plausibly attribute to their conscious thoughts, and invoke their unconscious thoughts or the 'spirit' of the author or his culture. Or we may appeal to the audience. The question 'What does this text mean?' can be expanded in two ways: (1) 'What does/did the author mean by the text?', (2) 'What does/did the text mean to its audience?' These expansions can in turn be interpreted in different ways. What constitutes the author and their meaning? We may restrict this to the author's conscious thoughts and intentions, or we may include their subconscious thoughts and intentions, or even the spirit of their age, implicitly granting this a share in their authorship. Who are the audience? It may be the author's contemporaries, or a later audience such as ourselves. The answers to the two questions are unlikely to coincide, if author and audience belong to different times or cultures. What Shakespeare meant by *Hamlet* is not what *Hamlet* means to a modern audience, unless that audience consists of skilful hermeneuticists. The answers are most likely to coincide if the audience is contemporary with the author; then author and audience share the same 'spirit', even if they do not have the same creative ability.

When Schleiermacher aimed to reconstruct the verbal meaning of a text, in the belief that 'thought and its expression' are identical, he was answering the question 'What did the text mean to its contemporary, cultivated audience?' When he tried to reconstruct the author's thought, in the belief that this need not be the same as its expression, he was answering the question 'What did the author mean by the text?' How can we know what Shakespeare meant (that is, what he had in mind)? Can we know it in much the same way as we know what a contemporary with whom we are conversing has in mind? Our minds are not wholly different from Shakespeare's; there is a 'spiritual affinity' between us. If we acquire sufficient knowledge of his life and works, we can imaginatively step into his shoes, reproducing his thought. It is possible so to step into someone else's shoes;

novelists often do it. It is doubtful whether we need to do this to know what someone is thinking: I may know that a dog wants a bone without imaginatively reproducing this want in myself.

3 Dilthey

Wilhelm Dilthey owed his acquaintance with hermeneutics to his theological training, but he used it to answer the question 'How do the social or human sciences differ from the natural sciences?' While the natural sciences explain (*erklären*), the social sciences understand (*verstehen*). They understand not simply texts and utterances, but any meaningful 'objectification' or 'expression' of human life: gestures, actions, one's own or another's life, paintings, institutions, societies, past events. There are two types of understanding. First, the understanding of simple expressions such as an utterance, an action or a gesture of fear. Here there is no gulf between the expression and the experience expressed: we understand immediately with no inference. Such understanding presupposes a medium 'common to the I and the You', an 'objective spirit' within which expression and understanding occur: a shared language and culture. Secondly, there are 'higher forms of understanding', dealing with complex wholes, such as a life or a work of art. A part has a meaning (*Bedeutung*) grasped by elementary understanding, the whole has a sense (*Sinn*) resulting from the ordered composition of its parts and grasped by higher understanding. Higher understanding is often provoked by a failure of elementary understanding. If I cannot immediately understand a person's action, I explore their culture or their life as a whole. If I cannot understand a sentence, I may interpret the whole book.

Often when elementary understanding fails, this is because a person - the author of a text, a gesture or an action - is unusual, and cannot be understood by the normal canons of objective spirit. To understand what the author says or does, we need to understand them in their individuality. Thus, higher understanding usually involves the understanding of individuals, not simply the general understanding appropriate for daily life. I also understand myself: by elementary understanding I know immediately that I am hungry, jealous and so on without recourse to my expressions. By higher understanding I make sense of myself, of my life as a whole. Higher understanding may again be stimulated by a failure of immediate understanding: how can I be jealous, I wonder, or how can I have done this? In higher understanding of myself, I become aware of my individuality, of what differentiates me from others.

In the 1890s Dilthey regarded psychology as the foundation of the social sciences. Later, hermeneutics displaced psychology. What interests the social sciences is not the 'soul', an individual's psychological processes, but 'spirit', the shared cultural world. The meaning of a play is independent of its author's 'soul'. Even if a work expresses joy or grief, they are states not of the author but of the 'ideal person' in whose mouth he puts his experience. Psychological life, even one's own, is known by the interpretation of its expressions: 'Man knows himself only in history, never by introspection' (1981: 348). Interpretation of history does not capture the essence of humans in a formula. It reveals to us the diverse possibilities of humanity, liberating us from the confines of the present.

4 Heidegger

Historical studies depend, Dilthey held, on our awareness of a human life as a coherent, 'historical' whole, embedded in a historical context. Martin Heidegger also connected questions about the meaning of historical texts with questions about the meaning of life. Texts like St Paul's letters cannot be understood from dictionaries and grammar-books alone; we need to understand the lives and situation of the author and his audience. In the case of any text, but especially those of a difficult philosopher such as Aristotle, we need to explore our 'hermeneutical situation', the situation, shaped by the past, which imposes on us the presuppositions we bring to the understanding of the text. Are the terms in which we interpret Aristotle appropriate? If not, how can we account for this apparent degeneration in our conceptual apparatus? These are questions about the present, and not just about contemporary philosophy, but about contemporary life and our tendency to misconstrue the past. So Heidegger moves on, in his lectures of 1923, to a 'hermeneutic of facticity', an interpretation of the human being ('Dasein') and everyday life.

Heidegger's *Being and Time* (1927) is a 'hermeneutic', in several ways. It explores Dasein's own understanding and interpreting: Dasein understands and interprets, not incidentally and sporadically but essentially and constantly. It understands - it knows its way around in the world as a field for its own activities. It interprets entities within the world - it sees a table as a table, a chair as a chair (see De re/de dicto). Such understanding and

interpretation are prior to the sciences. Before I interpret a document I see it as a document; before I do geology I see rocks as rocks. Interpretation involves presuppositions: to interpret something as a book I must be familiar with a world in which books have a place, a world of rooms, furniture, shelves, readers. Dasein also interprets itself. It regards itself, for instance, as a cobbler or a sailor. It regards its own life in a certain way. Implicitly in everyday life, more explicitly in philosophy, Dasein misinterprets itself - as a rational animal, a thinking substance, or a machine.

Heidegger describes Dasein's essential features, including interpretation and self-interpretation. Since philosophers themselves are Dasein, they display the same tendencies as Dasein in general. Hence, in studying Dasein, they understand and interpret it, continuing, on a higher, conceptual, plane, the self-interpretation that is an inescapable feature of all Dasein. Like all interpretation, Heidegger's involves presuppositions: a preliminary understanding of Dasein such as all Dasein has, a certain way of viewing Dasein (with regard to its 'being', rather than, say, its biological characteristics), and concepts to be applied to it, such as 'existence'.

The interpretation of Dasein and of being in general involves interpretation of texts. Since Dasein misinterprets itself, we must peel away layers of misinterpretation to see it as it is. These misinterpretations occur in their original purity in such philosophers as Kant, Descartes and Aristotle. We study them to see what they got right and where they went astray, to disclose and assess their influence on our hermeneutical situation and, where appropriate, to free ourselves of their influence. Heidegger interpreted such texts mainly in later works, but *Being and Time* foreshadows his procedure. Words do not have fixed, univocal meanings independently of their use and application. Meanings accrue to words from the significant interrelationships that constitute our world. A 'hammer' is not simply an 'implement for banging': the meaning of the word derives from the context of bench, nails, wood, workshop and customers that constitutes the 'world' of the craftsman. What a word means depends on the world of its user: by 'transport', 'freedom' or 'education', Aristotle does not mean the same as we do since he inhabited a different world. To understand a text we need to go beyond dictionaries and grammars to reconstruct the world of its author and the 'possibilities' it offered.

Later, Heidegger avoided the word 'hermeneutics'. But he continued to interpret texts, poetical as well as philosophical, in his quest for the 'meaning of being'. He equivocates on the question whether we can interpret a text definitively. Our interpretations of the past are bound to our hermeneutical situation and open to future revision. *Being and Time* implies that the meaning of an event or of a life, if not of a text, is what it means *for* us/me, depending on the significance we/I confer on it by and in our/my decisions for the future. Conversely, he claims - for all his 'violence' to the literal text - to unearth the meaning of, for example, Aristotle, with scarcely a hint that his own interpretation might later be seen, with equal justification, as yet one more misinterpretation. At all events, the hermeneutical circle now embraces interpreters and their presuppositions, as well as the text, the author and their culture. The prior understanding of the whole, that Schleiermacher and Dilthey saw as required for the interpretation of a part, can come only from the interpreter's own presuppositions. These may however be revised in the course of the interpretation.

5 After Heidegger

Heidegger's hermeneutics has been exploited by Bultmann, Ricoeur and Derrida, but his closest follower is Gadamer. Gadamer also insists that we recapture the context in which an author wrote, taking into account the intended audience and the questions the author was answering. Interpretation presupposes a historically determined 'pre-understanding', a 'horizon'; it involves a 'fusion of horizons', the horizons of the past and of the present. We cannot be sure that our interpretation is correct, or better than previous interpretations. Our interpretation, and our verdict on previous interpretations, is open to future revision. In interpreting a past text we explore our own pre-understanding as much as the text itself.

With Gadamer and others, hermeneutics has returned to its ancient and medieval roots. We no longer seek what the author meant by a text, but what the text means to, or for, us. The medieval justification of this is that God, the ultimate author of the text, can inscribe in it any meaning he chooses, however allegorical or anachronistic. The moderns justify it by appeal to the non-existence, indeterminacy, inaccessibility, or irrelevance of an author's intentions, or to the historically variable presuppositions of interpretation. Dilthey's extension of hermeneutics to lives and to historic events supports this trend. The 'meaning' of the French Revolution cannot be what its author(s) meant by it, or even what it meant to its contemporary audience. It is what it 'means' to successive later

audiences or even what they make of it by their own plans and decisions. Few argue, however, that the interpretation of a text is entirely at the whim of the interpreter. This would subvert the communicability of the hermeneuticist’s scepticism by allowing opponents to interpret its expression as they please.

Hermeneutics, biblical

Hermeneutics has traditionally been defined as the theory of interpretation. Biblical hermeneutics concerns the interpretation of biblical texts. But 'interpretation' tends to reflect the nature of the discipline only from ancient times to about 1960. Increasingly it has come to be seen not as a tool used for difficult or obscure texts, or even for the application of such texts to the present, but as a theory of understanding in the broadest sense. It currently also relates to views of contextual theories of meaning and truth, in contrast to formalist approaches.

From ancient times until about 1800, philosophy played a minimal role in biblical hermeneutics. The subject concerned theology in the context of grammatical, philological, historical and linguistic inquiry. With the work of Schleiermacher in the early years of the nineteenth century, however, hermeneutics entered a new phase. It became a transcendental discipline, seeking to explore the conditions under which the understanding of texts becomes possible at all. In the era following Schleiermacher, theorists drew on the work of Dilthey and Heidegger, among others.

A third phase began with the work of Hans-Georg Gadamer in the early 1960s. Gadamer replaced the Enlightenment preoccupation with 'method' in the context of 'science' and 'reason' with a hermeneutics which took full account of the interpreter's prior situatedness within a given historical tradition. This angle of approach was developed further by Habermas, who noted the role of 'interest' in understanding, and by Ricoeur, who, in dialogue with Freud and others, stressed the role of 'suspicion' as well as 'listening' in hermeneutics. Barthes and Derrida challenged the very notion of a 'given' text, shifting emphasis to construals by society and by readers which reflect motivations not immediately apparent from the supposed messages of texts.

This raises a multitude of fundamental questions for biblical hermeneutics and theology. If texts are no more than shifting constructs, what may still be said about divine grace or revelation? Do sacred texts merely mediate idolatrous constructs? How may hermeneutics serve to unmask interests which interpreters bring to the text and tempt them to use texts manipulatively?

1 The ancient world

Processes of interpretation of earlier biblical texts were already at work in parts of the Hebrew Bible. But hermeneutics entails conscious reflection on what it is to interpret, and in Hebrew tradition this did not explicitly emerge until the era of rabbinic theology, from 70 AD onwards. In the absence of the Temple and its institutions, reflection about the application of ancient biblical texts to the present became a matter of detailed concern. The so-called 'rules of interpretation' of Rabbi Hillel, though, were little more than rule-of-thumb rabbinic procedures (see Hillel ben Samuel of Verona).

Among the ancient Greeks, more conscious hermeneutical reflection arose over the issues of whether the 'classic' text of Homer could be interpreted allegorically, in such a way that stories of the exploits of the gods could be read as information about the world - about the properties of different substances, for example, or about virtues, vices and values. In the *Republic*, Plato expresses reservations about such allegorical 'under-meaning' (*hyponoia*), but many of the Stoics interpreted Homer allegorically and Zeno of Citium read parts of Hesiod in this way. The Jewish writer Philo of Alexandria drew on this tradition to interpret the Old Testament allegorically. For example, God cannot 'plant a garden' (Genesis 2: 8); the verse signifies God's 'planting' of virtue. Philo thus smoothed away both anthropomorphisms and time-bound regulations to open a path to the Hebrew Scriptures for educated Greek and Roman readers.

Whether, or in what way, the New Testament writers interpret the Old Testament allegorically remains a matter of controversy. Certainly they use typology (correspondence of events); it is debatable whether they use allegory (correspondence of ideas). Paul's interpretation of Genesis 16: 15 and 21: 2 in Galatians 4: 24-6 offers one of the most probable examples of allegory, although some insist that it is typology. In the sub-apostolic 1 Clement (*c.* AD 95), the scarlet thread in the house of Rahab (Joshua 2: 18, 21) is seen as an allusion to the blood of the cross. Gnostic writers used allegorical interpretation extensively, not least because it seemed to offer a secret key for initiates. This drove some of the Church Fathers, notably Origen (§1-2), to the first explicitly Christian hermeneutical reflections on method. The difficult question of the status of the Hebrew Old Testament as Christian

scripture was among those considered, not least because Marcion had rejected it in the second century.

2 Medieval, Reformation and post-Reformation issues

Origen argued that although the interpreter began with the literal (that is, semantic, grammatical or lexicographical) meaning, it was legitimate to proceed to a 'spiritual' meaning for pastoral purposes. An ambivalence towards allegorical interpretation emerged in Christian tradition. Origen's reason for being willing to go 'beyond the letter' was different from that of the Gnostics, although an intermediate and ambivalent position was held by Clement of Alexandria. Origen recognized the importance of the public domain rather than 'secret' meanings, and was concerned that 'the rude vessel of words' should be 'brought to life'. Here he anticipated the late-twentieth-century turn from author to reader. In the School of Antioch, however, the fourth-century writer John Chrysostom approached interpretation as a matter of disclosing 'the mind of the writer'. Hence, although he also used allegorical interpretation, he did so mostly in sermons, and to a much lesser extent in didactic expositions. On the other hand, the contrast between Alexandria (Origen and those who shared his method) and Antioch (Chrysostom and others, especially Theodore of Mapsuertia) is often exaggerated in popular works. By the time of Gregory the Great of Rome, in the second half of the sixth century, the notion of 'three senses of Scripture' (literal, moral and spiritual) associated with Origen had become the Gregorian tradition of four senses: the literal (semantic and historical); the allegorical (a theological or spiritual extension); the moral (an ethical application); and the anagogical (that which embraces the future).

The medieval period witnessed the rise of the *Glossa ordinaria* (Standard Gloss), which provided a brief explanatory comment on a given chapter or verse. Among some less learned or more manipulative writers these glosses were sometimes arbitrary or without due historical understanding. But some major thinkers, notably Hugh of St Victor, contributed commentaries (for example, on Lamentations) and biblical homilies (for example, on Ecclesiastes) which placed a renewed emphasis on the historical understanding of the text. Reading based on historical and textual study led on to meditation or spiritual reflection. The ultimate aim, however, was to combine such reading with purity of life, to seek loving contemplation of divine thoughts behind Scripture.

Thomas Aquinas discussed linguistic issues, such as the status of metaphor, raised by the biblical text. He was aware that the Gregorian 'fourfold sense' had the capacity to confuse readers unless its logic was clear. However, since he held that scripture reveals both God's being and God's will and purpose, Aquinas supported the notion of moral, allegorical and anagogical (eschatological) meanings in addition to the semantic or literal meaning, even if this last remained primary. Thus he lent his authority to the prevailing methods of medieval writers.

The Reformers reacted against these 'four senses' with grave suspicion. In his early writings, Luther (§6) followed medieval tradition. But he moved away from it for two main reasons: first, positively, because of his engagement with the linguistic and rational tools of Renaissance learning; and second, negatively, because of his perception that supposed 'spiritual' meanings could be used in manipulatory ways to serve the interests of ecclesiastical authority and to give the Bible 'a wax nose' to be pushed into any shape. In his middle and later years, he regarded all but the 'plain' meaning as 'nothing but rubbish'. For Calvin (§2) even more, the hermeneutical goal is to apprehend 'a true single [*simplex*] sense'.

The post-Reformation era witnessed a steady growth of works on hermeneutics. It seems that the term 'hermeneutics' first explicitly appeared as a title for a work in 1654, with J.C. Dannhauer. Major scholars of the eighteenth century included J.A. Turretinus, J.M. Chladenius, J.A. Ernesti and J.S. Semler.

3 Schleiermacher and Dilthey

Schleiermacher (§9) was nurtured in the tradition of Moravian pietism and became associated with the blossoming Romantic movement. He accepted the transcendental challenge of Kant's three *Critiques*, and perceived clearly the inadequacy and circularity of any system of hermeneutics that served some prior doctrinal understanding of texts. He asked two transcendental questions: how is Christian theology possible? And how do processes of understanding become possible?

Schleiermacher was the first theorist to perceive that the problem of hermeneutics lay in holding together each side of three sets of issues: how understanding in its 'divinatory' or trans-rational dimension interacts with the critical, rational appeal to patterns or regularities of criteria; how understanding the elements or components of texts relates

to a more intuitive anticipation of the text as a whole; and how understanding what is to be understood links or engages with a prior or provisional understanding of that to which the subject matter of the text relates. This last issue became known as the problem of 'pre-understanding', for which the German *Vorverständnis* became a technical term in later hermeneutics. As understanding of the text begins to develop, the revised or fuller understanding feeds back into the 'pre-understanding' to produce more appropriate questions and a better readiness to understand.

Simultaneously, understanding parts of the text depends on a provisional, quasi-intuitive leap into an anticipatory understanding of the whole, but at the same time corrects it, while the reverse process of correction and revision also takes place. Both of these processes constitute different versions of 'the hermeneutical circle'.

In biblical studies this hermeneutical approach had several effects. First, it underlined both the importance and the limits of the rational or 'scientific' aspect of enquiry. Dilthey, writing at the beginning of the twentieth century, took up this issue in his appeal to 'life' rather than to mere 'thought' as the key category in hermeneutical understanding. In his exposition of Schleiermacher, he took up and developed the latter's 'psychological' axis of hermeneutics, namely the need to stand in the shoes of 'the other' in order to understand the other on the basis of shared life and shared humanity. In his criticism of rationalism and empiricism, Dilthey argued that in the veins of the knowing subject (as defined by Locke, Hume and even Kant), no real blood flowed.

Second, the hermeneutical approach led to an emphasis on historical reconstruction in biblical studies, which cohered with the rise of biblical criticism. However, against many popular misunderstandings of Schleiermacher, it must be stressed that this arose not from preoccupation with 'genetic origin', but from the Romantic concern with capturing the living vision of which the textual remainder was a mere deposit. It was for this reason, and not out of mere antiquarian curiosity, that Schleiermacher worked backwards from the text to what lay behind it. It was a side effect in biblical studies that this fostered an approach to texts which used them as mere sources for historical reconstruction. This hermeneutical reductionism and instrumentalism would not have been endorsed by Schleiermacher, who is frequently blamed for it. The level of complexity and sophistication which characterizes his work is vigorously defended in Thiselton (1992).

4 The turn to existentialism

Martin Heidegger (§§2-3) took up and developed further the notions of 'the hermeneutical circle' and a prior 'life relationship' to that which the interpreter seeks to understand. But whereas Dilthey saw 'life' as part of a common humanity, Heidegger stressed the historical finitude and unique 'givenness' or situatedness of the interpreter within pre-given horizons of orientation and practical purpose. In continuity with Kierkegaard and Nietzsche, he called attention to the close connection between finite *Existenz* and the directionality of human will towards its own goals.

In the field of New Testament studies, Rudolf Bultmann (§§2-3) viewed this perspective as fruitful for a hermeneutical engagement with texts. New Testament texts, he argued, are not to inform neutral curiosity, but to challenge the human will. The interpreter may be misled by what appears to speak descriptively of God, Christ or human persons. For this, according to Bultmann, is the language of 'myth', which obscures its genuine purpose. Neither God nor Christ nor persons are to be 'objectified' as being or substance as such. Rather God addresses humanity through the pseudo-descriptive language only to summon humanity from inauthentic existence orientated towards the past and under law and bondage, to an authentic mode of existence made possible through the event of Christ (see Existentialist theology §3).

The relation between operative linguistic function and historical states of affairs for Bultmann remains a complex and controversial issue. 'Right-wing' critics accuse him of too readily collapsing the Bible into Christian existentialism; 'left-wing' critics accuse him of arbitrarily clinging to the factual reality of the cross, or of failing to carry through his 'demythologizing' by exposing 'God' to be no more than a functionally useful linguistic cipher. For this reason, 'the Bultmann School' broke apart in different directions. Ernst Fuchs, for example, provides a bridge between Heidegger and Gadamer, since Fuchs, with Ebeling, identifies the creative eventfulness of language as the key issue in hermeneutics.

5 Issues raised by Gadamer, Habermas, Ricoeur and Derrida

The publication of Hans-Georg Gadamer's *Truth and Method* in 1960 constitutes the most important turning point for the subject since Schleiermacher, who founded the modern discipline (see Gadamer, H.-G.). The term 'method' in the title stands in a negative, or at least ironic, relation to 'truth'. Gadamer attacks as an artificial abstract construct the pure 'reason' and 'method' of Enlightenment thought in Descartes (as opposed to Vico) and in all thinkers who naïvely assume that methods of science can disclose all truth. He agrees with his teacher Heidegger that the individual thinker is shaped by their situatedness within historical tradition. He writes: 'The self-awareness of the individual is only a flickering in the closed circuits of historical life' ([1960] 1989: 276). But this does not exclude the possibility of understanding, for 'pre-judgments' (*Vorurteile*) constitute a 'historical reality' in which the interpreter participates.

Gadamer clarifies the issue by drawing on the analogy of games. The presuppositional stance (that is, the ways in which the rules of the game determine goals and what counts as an appropriate move or strategy) determines 'meaning' and 'reality' for players more than their own conscious reflection. Thus a tradition of 'effective-history' (*Wirkungsgeschichte*) lies beneath the distinctive and indeed unique 'performances' which characterize each game, or each interpretive or communicative event. Gadamer has thus transposed the relation between the whole and the parts which occupied Schleiermacher and Dilthey into a post-Hegelian rather than post-Kantian key. All understanding, he believes, is hermeneutical, not value-neutral. This is what he means by 'the universality of the hermeneutical problem'.

Habermas (§§1-2) was quick to identify a lack of critical social awareness in Gadamer's hermeneutics. Where Gadamer spoke of 'pre-judgment', Habermas spoke of 'interest'. What determines the horizons of understanding, he argues, is social interests (which include power interests) on the part of interpreters and, more especially, their communities of interpretation. But Habermas refuses, as against Richard Rorty, to reduce this to social pragmatism. Through a carefully elaborated theory of communicative action, he denies that communities of interpretation are so radically conditioned by social and historical context that no trans-contextual criteria of meaning and understanding can remain operative. Thus his earlier work, *Knowledge and Human Interests* (1978), leads on to his more complex and valuable work, *The Theory of Communicative Action: The Critique of Functionalist Reason* (1984).

Paul Ricoeur moved from work on human will and fallibility to theories of symbol, and then through hermeneutics to a dialogue between hermeneutics and structuralism, ending with a dialogue between hermeneutics, metaphor and narrative theory. His later work returns to the relation between hermeneutics and personal agency. He is probably best known for his aphorism that 'the symbol gives rise to thought'. His work on hermeneutics led him to explore the phenomena of self-deception and 'double meaning' in Freud's *Interpretation of Dreams*. The element of disguise and deception led to his formulation of 'a hermeneutic of suspicion'. He writes that Freud's work 'compelled me to enlarge my first concept of hermeneutics beyond a mere semantic analysis of double-meaning expressions' ([1975] 1978: 318).

While Ricoeur rejects the 'reductionism' of Freud's theories as an explanation of human life, including religion, he accepts Freud's emphasis on the capacity of the self for self-deception. Hermeneutics, therefore, in Ricoeur's view, performs the double task of 'destroying idols' (that is, unmasking the wishes that condition interpretation and cause projection of one's own desires into texts) and 'listening to symbols'. The first entails a 'vow of rigour', the second a 'vow of obedience'. The symbolic level of meaning appears as metaphor in relation to sentences, and as the projection of narrative-worlds in relation to sentences which combine together to present a structured whole. Some of the more controversial aspects of his hermeneutics concern the 're-figuration' or 'construal' of narrative, and a readiness to speak at times of 'the death of the author' (1976: 29-30).

This attempt to speak of 'the death of the author' for interpreting written texts stems primarily from Roland Barthes. Barthes' semiotics, in turn, paved the way for Derrida. Jacques Derrida stresses that writing (in contrast to oral speech) entails 'the absence of the signatory' and even 'the absence of the referent' ([1967] 1976: 40-1). Further, no text is a 'finished' product or a 'given'. Allegedly on the basis of a theory of semiotics and textuality, he sees textual meaning as endlessly 'deferred'. On the basis of a legacy drawn partly from Freud, Husserl, Nietzsche and Heidegger, he proposes a hermeneutic that has affinities with postmodernism and articulates deconstructionism. In effect, it seems to reduce texts to an ever-shifting flux, which is constantly subject to new forms as new conventions and societal assumptions re-contextualize what on the surface appears to count as

meaning and truth.

6 Post-Gadamerian biblical hermeneutics

Two aspects of Gadamer's work have been of particular importance in the field of biblical studies. First, while he rightly insists that the interpreter must respect the distinctive horizon of the text, Gadamer urges that understanding works towards the goal, at least in principle, of a fusion of the two horizons of meaning and understanding. Second, his work stresses the distinctiveness and uniqueness of each 'performance' as an actualization of interpretation. His emphasis on the 'radical finitude' of each performance must be understood against the background of Hegel and especially Heidegger. Hence, issues of polyvalency of meaning arise. In biblical studies this engages with work on the 'narrative-worlds' of parables and raises questions about a reappraisal of 'tradition' and 'effective-history' as against Enlightenment reason alone.

The unmasking by Habermas of the role of 'interest' in interpretation coheres well with attacks on those interpretations of the Bible that function primarily to serve the interests of oppressive or 'establishment' groups. Thus it adds to the hermeneutical resources of feminist and liberation hermeneutics (see Feminist theology; Liberation theology §3). At the same time, however, the insistence of Habermas that trans-contextual criteria of meaning or truth also have some place firmly separates him from the social pragmatism of Richard Rorty and Stanley Fish. If Rorty's approach is accepted, it invites the oppressed to wield the same kind of instrumental tools as the oppressors, in which case hermeneutics comes to depend on the force of contextual rhetoric, not trans-contextual truth. But if Christian theology is to embody any universal truth-claim, this approach becomes difficult to sustain. Habermas offers a middle ground on which a socially sensitive hermeneutic may operate with intellectual integrity.

Ricoeur has illuminated symbol, metaphor and narrative for biblical hermeneutics. In particular, he constructively stresses both the creative power of 'double-meaning' language in biblical texts and rightly urges suspicion concerning the interpreter's own desire to manipulate them. He has also called attention to the importance of hymnic, narrative and wisdom modes of biblical discourse alongside the prophetic, didactic and directive modes.

It is too soon to chart the ultimate effects of the work of Derrida and deconstructionism on biblical interpretation. Some have attempted to view his approach as an iconoclastic tool which coheres with a 'silent' or 'negative' articulation of divine transcendence. But Derrida's work offers more than a tool. He himself is drawn towards the 'unfinished' vision associated with apocalyptic writings. But interpreters of the Bible have used deconstructive strategies of reading effectively, to date, only on such untypical literature as Ecclesiastes, Job and possibly some parables of reversal which serve only to break the spell of some established view. The best example with regard to the Old Testament is D.J.A. Clines' work on Job: Job 'undermines the… hierarchical oppositions on which it relies' (1990: 65). The most influential examples of work on the New Testament come from J.D. Crossan, who argues that parables subvert the very 'worlds' which they project.

The emphasis on polyvalency in textuality and the role of narrative and of active readers has led to an unprecedented interest in literary theory in biblical hermeneutics. In some quarters, this has led to a partial abandonment of necessary concerns about biblical languages and biblical history. In others, a genuine attempt is made to hold together the best in mainstream methods of enquiry with newer insights which, in some cases, have yet to prove their value fully. At all events, the shift of perspective in biblical interpretation has been considerable over the last twenty years, and biblical hermeneutics has come to occupy a necessary place, after long neglect, in most research universities. Very recently, attention is being given to the ethics of hermeneutics (Patte 1995), the hermeneutics of the self (Ricoeur 1990; Thiselton 1995) and speech-act theory (Wolterstorff 1995), all against the background of the challenges of postmodern thought.

Hermetism

A primarily religious amalgam of Greek philosophy with Egyptian and other Near Eastern elements, Hermetism takes its name from Hermes Trismegistus, 'thrice greatest Hermes', alias the Egyptian god Thoth. Numerous texts on philosophical theology and various occult sciences, ascribed to or associated with this primeval figure, were produced in Greek by Egyptians between roughly AD *100 and 300, and are a major document of late pagan piety. Reintroduced into Western Europe during the Renaissance, they provided considerable inspiration to philosophers, scientists and magicians of the fifteenth and sixteenth centuries.*

Hermetic literature can be divided into *philosophical* treatises, on God, the world and man, and *technical* writings on astrology, alchemy and other branches of occult science. The philosophical Hermetica comprise principally: (1) the *Asclepius* or *Perfect Discourse*, a longish work surviving in a Latin translation; (2) the *Corpus Hermeticum* proper, a Byzantine collection of fourteen treatises, translated into Latin by Marsilio Ficino in 1462-3 and published in 1471 under the title *Pimander* (after *Poemandres*, its first and most important treatise), to which three further pieces were later added; and (3) some twenty-nine extracts in the anthology compiled in the fifth century AD by John Stobaeus. The Stobaeus *Hermetica* vary in length from single sentences (12, 27, 28) to an important extract (23, from the *Korē Kosmou* or *Pupil of the Cosmos*) as long as anything in the *Corpus Hermeticum*.

The philosophical treatises take the form of dialogues, or rather, since disputation and argument are notably absent from them, of expositions, usually although not always by Hermes himself, to one or more trusting disciples. Their scenery and *dramatis personae* - Hermes, his son Tat, Asclepius (alias Imouthes or Imhotep), King Ammon and so forth - are Egyptian and ancient, investing these treatises, like so many other writings of the period, with the authority of primeval revelation. Their philosophy - that is, their cosmology and metaphysics - is a contemporary 'Middle Platonism' (see Platonism, Early and Middle), the only philosophical idiom available in late antiquity to anyone attempting a non-mythological treatment of these subjects. (There are also gnostic and Jewish elements, notably in *Poemandres* and *Corpus Hermeticum* III.) Their purpose, however, is not strictly philosophical. A treatise may start with some standard question of school philosophy - for example, motion (II), death (VIII), or intellection and sensation (IX). But the answer, often garbled, is seldom more than a starting point for meditation and homily. The aim is not to offer some new, coherent and discussible account of God, the world and man so much as to satisfy a religious need, common enough in this period, for a saving 'gnostic' illumination. The purpose of the Hermetist teacher - and the treatises tend to be stylized as lessons in a course of ever more esoteric instruction - is to generate a *gnōsis*, an intuitive knowledge of god and self, vouchsafed to very few, an answer in cosmic terms to the perennial question 'What am I here for? What am I?'. The instruction finds its fulfilment in intellectual illumination, as the pupil becomes aware of being a particle of divine life and light (*Poemandres* 21) and the teacher can say 'You have come to know yourself and our common Father' (*Corpus Hermeticum* XIII 22).

In this context, doctrinal consistency and lucid theory are minor considerations. There are numerous contradictions between the treatises - one text admits as much (*Corpus Hermeticum* XVI 1). Some of these go back to Plato's own works, to the contrast there between the *Timaeus*, with its picture of mankind placed in a good world by a good god - an optimism strongly endorsed by the *Asclepius* and by *Corpus Hermeticum* II, V-VI, VIII-XII, XIV, XVI - and the gloomier account of our human condition in the *Phaedo* and the *Phaedrus*, reflected in the severe pessimism of *Poemandres, Corpus Hermeticum* IV, VII, XIII and *Korē Kosmou*, when they dismiss the material world as a 'totality of evil' (*Corpus Hermeticum* IV 6), into which the soul has fallen as a punishment for original sin (*Korē Kosmou* 24), or in consequence of some primeval blunder (*Poemandres* 14). But the inconsistencies hardly matter. The Hermetic treatises are documents of spirituality, not philosophy. Scholarship has come increasingly to see them as translations, as products of a native Egyptian religious tradition (the very fact that they are attributed to Hermes-Thoth is confirmation of their author's religious loyalties) rewritten in the language of Middle Platonism.

Thoth was, among other things, the god of wisdom, knowledge and science. In Roman Egypt numerous works were ascribed to Hermes Trismegistus on technical subjects such as astrology, alchemy and the hidden properties of plants. His name is constantly invoked in magical papyri. These disciplines all rested on a principle, widely held in late antiquity and briefly sketched in the *Asclepius* (2-7, 19), of cosmic 'sympathy'. Linking things on earth to

each other and to things in heaven is a nexus of largely hidden sympathies and antipathies which can be used to explain, predict and manipulate the course of events. The philosophical Hermetica, where mentioning these occult sciences, give them a high religious colouring. Magic and philosophy alike, says the *Korē Kosmou* (68), nourish the soul. Both are ways to salvation.

Hermes was remembered as a magician, and also as a primeval sage, a younger contemporary of Moses, who foretold the coming of Christianity. During the Middle Ages, numerous works in Arabic and Latin were produced under his name. The arrival of *Corpus Hermeticum* in the West created something of a sensation: Ficino interrupted his life's work on Plato and Plotinus to translate it. A vastly older figure than Plato and a vastly purer exponent of the 'original theology' (*prisca theologia*), Hermes lent authority and respectability to the active interest which Ficino, Pico della Mirandola and others took in magic. The broad Hermetic vision of the world as a network of hidden forces waiting to by discovered and exploited by the magus was to be an inspiration to such luminaries of sixteenth-century science as Paracelsus, whose experiments in alchemy led to the discovery of laudanum, and Giordano Bruno, whose Hermetic interests ended with him burnt at the stake. The antiquity, and hence the authority, of Hermes Trismegistus received a fatal blow in 1614 when Isaac Casaubon demonstrated, on linguistic and other grounds, that the Hermetic writings could only be a late forgery. Hermes still had admirers and readers in the seventeenth century, including the Cambridge Platonists and even Isaac Newton. But Casaubon remained unrefuted; and the Hermetic writings lost their appeal to all save lovers of the occult and, in the twentieth century, historians of religion.

Herrera, Abraham Cohen de (*c*.1562-*c*.1635)

Herrera was a philosophically oriented Kabbalist who combined Neoplatonism and Kabbalistic knowledge learned from Israel Sarug, a disciple of Isaac Luria. In his Spanish works Puerta del Cielo (The Gate of Heaven), and Casa de la Divinidad (The House of Divinity), he considered Kabbalah as the source of the ancient truth.

Herrera believed that as the intellect is the highest epistemic grade, one must rely on philosophy to reach the divine secrets. He dealt with the concept of Ensoph (his own spelling of Eyn Sof - the Infinite) in terms of its Thomistic and Renaissance definitions - the Infinite that excludes limit. Tzimtzum is the voluntary Contraction of Ensoph, which prepares space for worlds to be created. The space opened up is metaphorically called Adam Kadmon (Primordial Man), the first emanation of which is the Intelligible World and the Tetragrammaton, the principle that shapes the Chain of Being around the Pythagorean number four. Neoplatonically, Adam Kadmon is the Intelligible World. Herrera's account incorporates further complex ideas about First and Second Causes of creation.

In 1699, Herrera drew the attention of Johan Georg Wachter, who, on the basis of Knorr von Rosenroth's Latin translations of Herrera's works in Kabbala Denudata, blamed him for inspiring Spinoza's supposed pantheistic heresy.

1 Life, writings and sources

Born to a *converso* family, probably in Italy, Abraham Cohen (Alonso Nuñez) de Herrera worked in the commercial service of the Sultan al-Mansur of Morocco. In 1596 he was taken prisoner by the Earl of Essex at Cadiz and brought to London, but was finally freed after extended diplomatic negotiations. He met Israel Sarug in Ragusa and delved into Lurianic Kabbalah (see Kabbalah). In Amsterdam he belonged to the synagogue which Spinoza attended in his youth, continued in business, and headed the committee that approved Joseph del Medigo's *Sefer Elim (Book of Deities)* for publication by Menasseh ben Israel. In the latter's own *Conciliador (Conciliator)*, the imprimatur calls him *Philosopho, Theologo y Cabalista* (philosopher, theologist and Kabbalist).

Between 1620 and 1632 Herrera wrote *Casa de la Divinidad* and *Puerta del Cielo*, to introduce other ex-Conversos to Lurianic mysticism. Isaac Aboab da Fonseca translated the works into Hebrew (1655), but lacked his master's philosophical background and failed fully to capture the letter and spirit of the Spanish originals, especially when pagan or Christian sources came into play. To these two works Herrera added two auxiliary booklets, *Epitome de la Logica o Dialectica (Summary of Logic or Dialectics)* and *Libro de Diffiniciones (Book of Definitions)*.

Herrera's library included the chief medieval philosophers, such as Aquinas and other scholastics, but he favoured Marsilio Ficino, Giovanni Pico della Mirandola and their Neoplatonic followers. Besides Maimonides, Albo and Leone Ebreo, he cites Kabbalist sources, including Hayyim Vital's unprinted tractates and sayings heard from Sarug. But he never cites such writings attributed to Sarug as *Limudei Atzilut (Studies of Emanation)* and does not ascribe to him the doctrines of the *malbush* (garment) or the *shi'ashua* (the delighting motion), which are central in his own thought. Indeed, he relies not on Sarug but on Moses Cordovero (1522-70) in dealing philosophically with Kabbalah.

2 Philosophy and Kabbalah

Herrera viewed Kabbalah, stemming from Adam or Abraham, as the fount of *prisca theologia* (ancient theology), standing above philosophy and even theology. He saw no conflict among the three, nor between Lurianic and Cordoveran Kabbalah, but relied on philosophy for aid in deciphering the enigmatic language of the Lurianic Kabbalah, just as Pico deciphered the gnomic symbolism of Plato.

Puerta del Cielo opens with reflections on the Kabbalistic Infinite, here equated with the First Cause of the scholastics. The Ensoph (Infinite) (so transcribed by Herrera himself) was a subject Lurianic Kabbalists avoided, loath to conceptualize God's transcendence. But Herrera gained support from scholastic works like Aquinas' *Summa contra gentiles* and *Quaestiones disputatae* and their Renaissance interpreters. Thus he adopts Aquinas' and Ficino's distinction between the privative infinity of matter, which longs for limit, and the negative infinity of

the First Cause, which excludes limit. Infinity verges towards limit in Tzimtzum, the Contraction of the Ensoph. Adapting Aristotle's principle (*Physics* VII) that every cause is present in its effect, the transcendence of the Ensoph is rendered immanent (see Aristotle). Following Pico's tripartite ontology, Herrera calls the First Cause 'eminent' or 'causal'; the Sephirot (as with Ensoph, his own transliteration of Sefirot - Numerations), or primal hypostases, 'formal' or 'proper'; and the Lower Worlds 'remote' or 'participative'.

Unlike some Kabbalists, Herrera does not imagine Tzimtzum in cathartic, mythical or eschatological terms but conceptualizes it as a voluntary act of Ensoph, preparing space for worlds to be created. What had been a convulsive event within the Divinity, is now a metaphor of the transition to finitude. The space opened up in the Ensoph is metaphorically called Adam Kadmon. This first creation by, from and within Ensoph is the ultimate substrate of potentiality and the first form or actuality.

Herrera treats the doctrine of Adam Kadmon as a central Lurianic theme and labours to find it in pre-Lurianic authorities - the *Sefer Yetzirah (Book of Creation)*, the *Zohar (Book of Splendour)*, Cordovero - arguing that the Keter Eyon (Supernal Crown) is, in fact, Luria's Adam Kadmon. He equates the distinction in *Tikkunei Zohar* between the 'Cause of All Causes' and the 'Cause of Causes' with that between Ensoph and Adam Kadmon. Two generations later this conclusion had dramatic consequences in the theology of the followers of Shabtai Tsvi (Sabbatai Sevi, as the name is sometimes transliterated), which sharply distinguished the First Cause from the Second and equated the latter with the God of Israel.

In a remarkable collation of medieval and renaissance sources, Herrera identifies the Adam Kadmon as a primal hypostasis with the Tetragrammaton, shaping the entire Chain of Being around the Pythagorean number four as the Ineffable name does. Neoplatonically, Adam Kadmon is the Intelligible World and thus the abode of the Sephirot. Responding to the problematics of emanation, Herrera presents the first perfect effect as the first link in an emanative chain, above which no higher perfect effect is possible.

In Cordovero, the Ensoph begins the emanative process by taking pleasure in God, either intellectually or somehow more concretely. But Herrera ascribes the doctrine of *shi'ashua* to Luria and interprets it metaphorically: the delighting motion of sexual congress within the Ensoph leads to a cosmic pregnancy and the birth of the finite from the infinite. Herrera interprets this imagery in terms of an intellectual process within the First Cause that gives definition to its future effects.

Herrera considers the Sephirot, or hypostatic numbers, as the cornerstone of the Kabbalah, which sets numerous hypostases between Ensoph and the Lower Worlds. Relying on the medieval scholastic Cardinal Pierre d'Ailly, he suggests that the First Cause acts the better through Secondary causes. The Sephirot are representations of Ensoph, the world of beauty surrounding the supreme good (see Plato's *Second Letter*) and the formal mode of being that provides our epistemic access to the First Cause. They are thus the *malbush* or garment of Ensoph, but they emanate from Adam Kadmon and lie below it, not at the top of the ontic hierarchy, like the *malbush* in Sarug. As a secondary cause, each Sefira is the supreme perfection of its own genus, heading a certain order of perfections, a supreme *henad*. This Proclean excursion leads Herrera to the audacious description of the Sephirot as secondary deities - a conception that influenced the Sabbatean subordination of the God of Israel.

Transposing the dynamism of Luria's divine lights into the language of ideas, Herrera interprets the Kabbalistic *Mot ha-Melachim* (Death of the Kings) and *Shevirat ha-Kelim* (Breaking of the Vessels) as metaphors for the Platonic fall of the soul into the body. Following Ficino's *Theologia platonica (Platonic Theology)*, he explains that when our soul inclines towards the body it forgets the divine intelligibles. *Tikkun* (restoration) is the return of divine intellects to their former perfection. Intellection, like biological generation, results from the union of the (male) intelligible with (female) intellectual receptivity. The Broken Vessels are restored not by additional light or power but by heightened intellectual receptivity.

In Kabbalistic emanation the soul is represented as a circle, a space produced by the self-contraction of the Infinite. The intellect is a straight line descending through that space. Discussing this idea with Sarug, Herrera had wondered why the circle, a curved line, takes precedence over a straight line. Sarug suggested that Luria's circle was in fact a single point, preceding the line as the principle of life. The line penetrating soul-space descends to produce more and more circles, conjoining soul and intellect, ultimately even in the lowest worlds (see Soul, Nature And immortality of the).

The psychological chapters of *Casa de la Divinidad* elaborate a doctrine of prophecy based on reconciling Lurianic with other Kabbalistic, scholastic and Renaissance ideas. Prophecy, Herrera concludes, is the highest grade of intellection granted by the divine will. Herrera adopts Aquinas' view and rejects that of Maimonides, which finds prophecy only in the most intellectually prepared. Here Herrera's intellectualism bends towards tradition.

3 Legacy

Herrera's conclusions were not wholly accepted, even by his few disciples. By the later seventeenth century his school had become quite unfamiliar with scholastic arguments, and those arguments themselves grew increasingly obsolete. Yet several prominent Kabbalists did adopt the conclusions of Herrera's metaphorical hermeneutic, rejecting in particular the notion that Tzimtzum was a real event within the divinity. Among these Kabbalists were the Sabbatean Miguel Cardoso and such anti-Sabbateans as Joseph Ergas and David Nieto. Herrera's strong opponents on this issue included the Sabbatean Nehemia Hayoun. Most of Herrera's adversaries disliked his reliance on philosophy, and even disciples like Aboab and Zakuto were unfamiliar with Herrera's more technical writings and confined themselves to quoting sayings from his doctrine of the soul. Yet the Hasidic thinker Baruch of Kosov is influenced by Herrera's findings, and the implicitly philosophical discourse of the Kabbalist Moshe Luzatto shows Herrera's distinctive influence.

The influence on Spinoza sometimes ascribed to Herrera is harder to detect. Many modern scholars assume, because of some terminological similarities, that Spinoza knew Herrera's writings, perhaps from his youth. Herrera's Sephirot, for example, each perfect in its own genus, have been linked with Spinoza's theory of God's attributes. Closer analysis shows that this and similar presumed parallels, for example, those regarding creation, reflect a common Judaeo-Spanish background and the influence of the scholastic and Renaissance literature that both men read but each used in his own way.

Hertz, Heinrich Rudolf (1857-94)

Heinrich Hertz demonstrated the existence of radio waves in research between 1887 and 1888, opening the way for Marconi to develop long-distance radio communication. Hertz's results confirmed Maxwell's electromagnetic theory, and sealed the fate of action-at-a-distance in physics. His theoretical analysis included the famous dictum: 'Maxwell's theory is Maxwell's system of equations'. Hertz also developed a new formulation of Newtonian mechanics using the concepts of mass, length and time, but not force. He presented mechanics as the axiomatic consequence of a single fundamental law: 'every free system persists in its state of rest or of uniform motion in a straightest path'. Hertz's ideas influenced later philosophers of science but were most important as a source for Wittgenstein's Tractatus Logico-Philosophicus, which influenced logical positivism. Hertz's proposal to eliminate the concept of force in physics was an important contribution to the twentieth-century ideal of a philosophical method that does not solve, but rather dissolves, philosophical problems.

Heinrich Hertz began studies under H. von Helmholtz at Berlin in 1878. At that time there was no general agreement on the nature of electricity or its fundamental laws. For Wilhelm Weber electrical currents were counterflows of positive and negative electric particles, with forces between them depending on both their positions and their motions. F.E. Neumann used potential functions and avoided electrical particles. J.C. Maxwell also used potentials, but believed that motions in a universal ether underlay electricity and magnetism (see Electrodynamics). Helmholtz constructed a synthetic theory that led to all three alternatives as special cases. He believed, with Weber and Neumann against Maxwell, that forces acted instantaneously at a distance. He criticized Weber's theory on conceptual grounds - it violated conservation of energy - but failed to produce experimental results that would distinguish between the theories.

In 1879 Hertz showed that the 'inertia' of electricity was either nonexistent or impossibly small, providing the first strong experimental evidence against Weber's theory. A later series of experiments (1887-8) made all theories except Maxwell's untenable. Hertz showed that electrical oscillations in open circuits generated electromagnetic waves in the surrounding space which travelled at the speed of light, and could be refracted, reflected, polarized and diffracted. None of this could be reconciled with forces acting at a distance (Buchwald 1994). Development of Maxwell's theory led directly to Lorentz's classical electron theory (from 1892), which was superseded in turn by quantum mechanics and relativity, in the early twentieth century (Jungnickel and McCormmach 1986).

In the last years of his short life Hertz turned his attention to another theory that existed in several different versions: classical mechanics. As it was impossible to distinguish the versions experimentally, Hertz fell back on philosophical analysis, and it is to this work that he owes his main philosophical influence.

In the introduction to his *Principles of Mechanics* (1894) Hertz compared three 'representations': the traditional version of mechanics presented by Newton and refined by Lagrange; the contemporary Energeticist formulation; and Hertz's own. Each version differed mathematically, and employed different fundamental concepts. Newton and Lagrange employed the concepts of space, time, mass and force. The Energeticists replaced mass and force with the concept of energy. Hertz proposed to eliminate force but to introduce no new concepts. These different representations of mechanics were compared by three standards called by Hertz 'permissibility', 'correctness' and 'appropriateness'. In modern terms these requirements might be expressed as logical adequacy, empirical adequacy and perspicuity. Hertz maintained that the mechanics of Newton and Lagrange had yet to be presented in a form that avoided contradictions, and might therefore be impermissible. Energeticist mechanics was either incorrect or inappropriate. To be appropriate a representation should not exclude anything essential ('distinctness'), and should not include anything inessential ('simplicity').

To maximize 'appropriateness' it was important to eliminate 'empty relations' - concepts with no counterparts in the real world. Examples were the 'idle wheels' introduced by Maxwell in his 1862 theory, to allow cells of ether spinning in opposite directions to rotate freely. Equally 'permissible', 'correct' and 'distinct' representations that did not contain a concept showed it to be superfluous. In Hertz's analysis, 'force' was such a concept. This served Wittgenstein as a model for the elimination of signs from language that fail to mirror the world.

Wittgenstein's picture theory of meaning (see Wittgenstein, L. §3) extends Hertz's account of scientific theories as

representations to language as a whole. The critical method of the *Tractatus Logico-Philosophicus* follows Hertz in attempting to eliminate 'empty relations' and to define its domain of inquiry from within. Wittgenstein's 'objects', and the technique used to place awkward questions outside the domain so they need no answers, are also influenced by Hertz (Barker 1980; Hamilton 1994). The account of science in the *Tractatus* 6.3 covers many issues treated by Hertz in his analysis of mechanics (Barker 1979).

In the *Philosophical Investigations* Wittgenstein continues Hertz's programme of conceptual reform based on scrutiny of our mode of representation, developing methods of dissolving philosophical problems by bringing his audience to see that certain linguistic elements do not deserve their accustomed status. Throughout his mature work Wittgenstein refers to concepts that fail philosophical scrutiny as 'idle wheels'. Thus, Hertz not only provided one of the starting points for philosophy of science, in his account of theory choice, but, through the work of Wittgenstein, Hertz's call to eliminate force from physics contributed to twentieth-century philosophers' attempts to dissolve philosophical problems by eliminating conceptual confusions.

Hervaeus Natalis (d. 1323)

The French scholastic philosopher and theologian Hervaeus Natalis was not only one of the most influential early Thomists, but was also an original thinker who made an important contribution to the medieval debate on intentionality. He examined carefully the ontological question of what intentional objects are, and discussed the epistemological problem of how they are generated in a cognitive act. Hervaeus argued that intentional objects are 'third entities' that cannot be reduced to extramental or mental entities, a thesis that sparked controversy in the fourteenth century.

Hervaeus Natalis (Hervé Nédellec, or Nédélec) was born in Brittany in the middle of the thirteenth century and entered the Dominican Order in 1276. He commented on the *Sentences* of Peter Lombard at the University of Paris in 1301-2, obtained the degree of Master in Theology in 1307 and acted as *magister regens* until 1309. From 1309 to 1318 he headed the French province of the Dominican Order, and was elected Master General of the Order in 1318. He died in 1323, shortly before the canonization of Thomas Aquinas.

Hervaeus eagerly defended and developed Aquinas' theology and philosophy. In his *Defensa doctrinae D. Thomae (Defence of Saint Thomas' Teaching)* he expounded Aquinas' theological methodology, and in his *Quodlibeta* he defended the Thomistic epistemology against the objections of Henry of Ghent. Yet he did not slavishly follow Aquinas. In his philosophy of mind, he distinguished himself as an original thinker who exerted a considerable influence on fourteenth-century debates, both on the Continent and in England.

Hervaeus discussed extensively the question of the nature of intentional objects, that is, the objects of directed cognitive acts (see Intentionality). In his *Tractatus de secundis intentionibus (Treatise on Second Intentions)*, the first medieval treatise dealing exclusively with the problem of intentionality, he claimed that these objects are not the extramental things that have real existence, because even if one directs a cognitive act towards a nonexistent object (for example, a chimaera) or towards a not actually existing object (for example, the dead Caesar), the act is directed toward something. Nor are these objects 'intelligible species', that is, representational entities produced by the intellect and existing in the intellect; these species are only the means by which the intellect has access to the intentional objects, but not the objects themselves. Rather, intentional objects are peculiar things with 'objective existence': they have existence only *qua* objects of the intellect and cannot be reduced to the species of things having 'subjective existence', that is, the kind of existence a quality has in a subject. Thus, although several people cognizing a table have their own individual species, which subjectively exist in their individual intellects, all these people are directed toward one and the same intentional table.

Hervaeus emphasized that every intentional object of a cognitive act has objective existence. All that varies is the foundation of such an object. If one is having a cognition of an existing table, the intentional table is immediately founded upon the real table. If, however, one is having a cognition of a chimaera, the intentional chimaera is founded upon the combination of three kinds of real animals. Of course, the cognition of a nonexistent thing is more complex than that of an existing thing because it involves the combination of various real things and the formation of several intelligible species; but the important point is that in cognizing a nonexistent thing, one does have an immediate intentional object.

Hervaeus held that in addition to particular intentional objects (so-called 'first intentions') there are also universal intentional objects. Having cognized a particular thing, such as a human being, one is also able to cognize the universals 'human being' (species) and 'animal' (genus). These universals are abstracted on the basis of particular intentional objects and function as higher-level intentional objects (so-called 'second intentions'). Such an abstraction is possible because universals are instantiated in particular things. This claim makes it clear that Hervaeus' theory of second intentions is closely linked to a realist theory of universals (see Universals).

Hervaeus' introduction of intentional objects with a peculiar ontological status sparked an intense discussion among some of his fourteenth-century contemporaries and successors, including Peter Aureol, William of Ockham, Walter Chatton and Adam Wodeham. Ockham, in his *Ordinatio*, adduced two main arguments against Hervaeus' theory of intentionality. First, the introduction of intentional objects threatens direct realism: if one only has immediate cognition of intentional objects, one never has direct access to extramental reality. Second, if

intentional objects are really distinct from the extramental things, entities will be multiplied without necessity; for each thing with real existence there will be a corresponding thing with objective existence. This doubling of the world is superfluous, Ockham claimed, because the cognitive act is by itself directed toward the extramental thing, without there being any need for an intermediary entity.

Yet, in evaluating Ockham's famous criticism, one should take into account the fact that Hervaeus did not aim to refute direct realism or to posit superfluous entities. Rather, he intended to point out that the thing *qua* cognized thing is not simply the extramental thing, which in itself has no linkage with the intellect, but something founded upon the extramental thing that somehow hooks the intellect up to this thing and determines the cognitive act. Thus, his theory of intentional objects should be understood as an attempt to understand what the content of a mental act is - an attempt that had an impact not only on late medieval discussions, but also on Brentano's philosophy of mind (see Brentano, F.C.).

Herzen, Aleksandr Ivanovich (1812-70)

Lauded by Nietzsche as 'a man of every distinctive talent' and admired by Lenin as the founder of the Russian revolutionary movement, Herzen eludes all neat categorizations. As a moral preacher he stands alongside Tolstoi and Dostoevskii (who praised him as a poet). As a philosopher, he was the principal interpreter and popularizer of Hegel's thought in Russia in the first half of the 1840s, while the rebellion against metaphysical systems in his mature work has led him to be seen as a precursor of existentialism. Through the Russian press that he founded in emigration he helped to shape the beginnings of a public opinion in his country and played a major role in debates on Russia's political future on the eve of the emancipation of the serfs, while laying the foundations of the Russian populist movement through his writings on Russian socialism. He is best known in the West for his memoirs, Byloe i dumy (My Past and Thoughts) (1861, 1866), which rank among the great works of Russian literature, and for S togo berega (From the Other Shore) (1850), the most brilliant and original of the works in which he expresses his rejection of all teleological conceptions of history.

1 Life and works

Aleksandr Herzen owed his surname to an affair of the heart between a rich and cultivated Russian landowner, Ivan Iakovlev, and the daughter of a minor German official whom he met when travelling in Europe. Although his parents never married, Aleksandr enjoyed the status of a pampered only son. He received a rounded education in European culture from foreign tutors, and was especially drawn to Rousseau, Voltaire, Schiller and the history of the French Revolution. His illegitimacy undoubtedly contributed to his precocious sense of independence and spirit of protest against the existing order. He identified with the heroes of the Decembrist Revolt of 1825 and (an event celebrated in the history of the Russian revolutionary movement) made a vow with his cousin Nikolai Ogarev at the age of 16 to devote their lives to the struggle against despotism in their country. Like other Russians of his generation, he channelled his frustrated urge for political action into philosophical speculation and was much attracted to the historiosophical schemata of German Idealism. But in an essay written as a student of natural sciences at the University of Moscow he points out that the 'one-sidedness' of pure speculation had been demonstrated by Francis Bacon: only by linking 'the rational method with the empirical' (a combination which Herzen later, in an echo of Feuerbach, calls 'speculative empiricism') would mankind finally achieve an approach to knowledge that would reconcile the claims of the particular and the universal, the individual and the social whole. Such a reconciliation was to be the main concern of Herzen's later thought. It drew him to doctrines of palingenesis and to the humanistic socialism of the Saint-Simonians, whose theories he adopted with Ogarev and their circle in 1833: an event that has been seen as marking the birth of socialism in Russia.

The following year the circle was arrested on suspicion of spreading subversive ideas. Herzen spent nearly a year in prison, followed by five in provincial exile, when (for the last time in his life) he plunged into romantic introspection and religious mysticism. In 1840 he was allowed to return to Moscow, where Hegel's influence was at its peak. He embarked on a systematic study of Hegel's philosophy (during which he was exiled for another year), which resulted in two long cycles of essays: 'Diletantizm v nauke' ('Dilettantism in Science) (1842-3) and 'Pis'ma ob izuchenii prirody' ('Letters on the Study of Nature') (1845). The most important critique of Hegel to appear in Russia in that decade, Herzen's essays were much influenced by the left Hegelian 'philosophy of action' and the anthropocentrism of Feuerbach, which had greatly excited him. In Hegel's vision of dialectical becoming he saw a justification of his own hopes of a socialist transformation. As he put it in the Aesopian language of his essays, in Hegel's philosophy abstract thought had reached its highest achievement by liberating men's minds from the transcendent authorities of the past. The next stage was liberation in life, the move from philosophy to action (see Hegelianism, Russian).

Herzen's vision of the path that action would take was shaped in particular by Proudhon's anarchism, which promised the kind of reconciliation of individual freedom with social harmony that he sought. Unable to discuss political theories in print in Russia, he directed his efforts to fostering the inner moral independence which he saw as the precondition of political liberty, through essays that criticized the human tendency to seek moral direction from external authorities and norms. After 1845 he turned from philosophy to fiction, exploring the problem of moral freedom in short stories and a semi-autobiographical novel *Kto vinovat? (Who is to Blame?)* dealing with a love triangle. In 1847, finding his talents stifled in his country, he emigrated with his family to the West.

His historical optimism was shattered by the European upheavals of 1848. Observation of political events in France from 1847 until 1850 convinced him that parliamentary democracy was a palliative that did not address fundamental issues of social injustice, and he accused both liberals and radical republicans of a worship of political forms combined with indifference to the real needs and aspirations of the masses. In *From the Other Shore*, his philosophical summing-up of the lessons of 1848, he attacked the utopianism of the European left as both empirically unfounded and morally pernicious in subordinating the self-fulfilment of living individuals to the empty abstraction of progress.

With the disappointment of his own utopian hopes of imminent social transformation in the West, Herzen turned his attention to the socialist potential of Russia. The theoretical foundations of Russian populism were laid between 1849 and 1852 in a series of essays (such as 'Ruskii narod i sotsializm' ('The Russian People and Socialism'), addressed to Jules Michelet) in which Herzen sought to acquaint progressive Europeans with the existence of a radical intelligentsia in Russia and the potential of the peasant commune. (His own interest in the commune had been aroused by discussions with the Slavophiles in the early 1840s.) He pointed out that its democratic structure, guaranteeing the right of all its members to the use of a share of its land, contained the seeds of a solution to the problems of pauperization and social atomization currently facing the West.

In 1851-2 Herzen's personal life was shattered by a series of tragedies beginning with the revelation of an affair between his wife and an intimate family friend, the German radical poet Georg Herwegh. After she ended the affair, Herwegh circulated his version of events among the European radical community with the intention of discrediting Herzen, who vainly sought to be publicly vindicated through a revolutionary 'court of honour'. In the midst of these betrayals and humiliations his mother and younger son were drowned at sea. His wife, her health destroyed by the succession of calamities, died a few months later.

The effect of these tragedies was to intensify Herzen's sense of alienation from the West and turn his full attention back to Russia. He began his memoirs, *Byloe i dumy (My Past and Thoughts)*, 'to get into communication with my people', and in 1853 embarked on a new phase of his life with the founding of a Russian Press in London to act as his people's 'uncensored voice' in exerting pressure on the Russian government for reform. In 1856 Ogarev arrived from Russia to join him, and became co-editor of his celebrated periodical *Kolokol (The Bell)*.

Herzen emphasized that his press was not to be the vehicle for a particular political programme or ultimate ideal (his memoirs record that his personal tragedy had destroyed the last remnants of his early utopianism and forced him to accept the dominant role of chance in human affairs). While not renouncing his hopes of a future 'Russian socialism' he saw his political role as mobilizing opinion within Russia to exert pressure for immediate concrete reforms (in particular, emancipation of the serfs, freedom of speech and the end of corporal punishment), and providing a forum for discussion about further steps, in the hope of reaching a consensus on the social form most capable of combining individual liberty with social cohesion. What such a form would be, he stressed, depended on contingent circumstances and could not be predicted in advance.

While *Kolokol* played a major role in shaping public opinion in Russia on the eve of the Great Reforms, after the Emancipation Herzen's open-mindedness on the paths of progress brought him into sharp conflict both with the Russian liberals (who wished Russia to follow a Western path to constitutional democracy), and the radicals who preached an immediate transition to socialism through revolution. Herzen's preference for evolution over revolutionary violence alienated him from the left, while his refusal to exclude revolution as a means of progress was condemned by the liberals.

In a number of essays (notably 'Robert Owen', and those found in 'Kontsy i nachala' ('Ends and Beginnings') and 'K staromu tovarishchu' ('To an Old Comrade')), Herzen developed his view of the open-endedness and unpredictability of the historical process against what he saw as the deterministic utopianism of most Russian progressive thought.

Herzen's complex vision of the historical process met with little sympathy or understanding among the Russian intelligentsia. In 1863 he moved to Geneva in order to have closer contact with the growing population of Russian radical émigrés, but his relations with them soon soured. *Kolokol* ceased publication in 1867 (although it was briefly revived in a French edition), and Herzen's political isolation became complete. His last years were embittered by a stormy relationship with Ogarev's wife Natalie who bore him three children. 'Probably everyone

in Russia will say that Herzen should have died sooner, that he outlived his reputation', Turgenev wrote on his death: but from a historical perspective the isolation of Herzen's last years can be attributed to the fact that his vision was far in advance of his time.

2 Philosophy of history

'Do not look for solutions in this book', Herzen warns the reader of *From the Other Shore*: 'in general, modern man has no solutions…. We do not build, we destroy; we do not proclaim a new revelation, we eliminate the old lie' ([1850] 1956: 3). To a critic who asked him to explain his system, he retorted that his philosophy of history was no system, only 'a scourge to be used against absurd theories…a fermenting agent, no more'. It was, however, systematically consistent in its attack on all systems, dogmas and political eschatologies that claimed to justify or explain the oppression of human beings by reference to idealized abstractions such as freedom, progress, humanity or the common good.

Like most radicals of his time, Herzen was deeply indebted to the anthropocentrism of the Left Hegelians, from whose perspective he approached Hegel's dialectic as 'an algebra of revolution'. But (like Proudhon, who influenced his thought in this respect), he rejected the secular eschatology which substituted Universal Reason for Divine Providence as the guiding force of the historical process, accusing both Hegel and his radical interpreters of evading the logical consequence of his historicism: the denial of all suprahistorical absolutes and universal historical goals.

In his major professions of philosophical faith (*From the Other Shore*, 'Robert Owen', 'Ends and Beginnings'), Herzen defines what Nietzsche would call the 'craving for metaphysical comfort' as the principal obstacle to the fulfilment of human potential in the historical world. He points out that observation and experience do not support the view that history is an ascent towards a final goal, whether pre-programmed by the Creator or inherent in the rational structure of the universe. 'Life has its own embryogenesis which does not coincide with the dialectic of pure reason' ([1850] 1956: 31). It was more like nature than was commonly believed: chance and 'dark forces' constantly triumphed over rational intention, killing off promising beginnings or unpredictably rerouting them into new channels. No ideal could ever be realized in the way in which it had been conceived, no model of human society could be more than a provisional experiment whose life expectancy would depend largely on chance. Herzen attributes the reluctance of mankind to face this truth to the dualism pervading human judgments. Anticipating Nietzsche's critique of otherworldly values that degrade the world of experience, he notes that all the great moral systems have been built on the assumption that process, chance and change are less real than timelessness and stasis, singular events less significant than universal laws and norms. All our images, all our metaphors, are imbued with a dualism that 'sides with one shadow against another, granting spirit the monopoly over matter, species the monopoly over the particular, sacrificing man to the state, the state to humanity' ([1850] 1956: 136). The Enlightenment had replaced Christianity with 'the *Religion des Diesseits*, the religion of science, or universal, hereditary, transcendental Reason'. We seek (against the empirical evidence) to impose a libretto on history; yet if there were such a libretto, we would be mere wheels in a machine. By denying us the consolations of self-transcendence, history maximizes the possibilities of self-creation. Instead of seeking to escape our contingency we should cease to allow preoccupation with an unknown future to distract us from self-fulfilment in the present; but to do so we must revise all our notions about the relation of the individual to himself, society and the state.

Herzen believed that the traditional vocabulary of philosophy was inimical to the perception of reality that was born with Hegel's historicism. He stresses that it is not just a question of revising our categories of ultimate goals and purposes; we must cease to derive the significance of the individual and the contingent from its place in some larger scheme of things. To the '*memento mori*' of metaphysics he opposes the '*memento vivere*' of nature and art. 'Thought must take on flesh': we must counter our tendency to rationalize and universalize by cultivating an aesthetic receptivity to the transient and unrepeatable manifestations of life which will allow us maximally to exploit the multiplicity of possibilities for self-creation.

Herzen's writings on this theme seem to anticipate Nietzsche's notion of *amor fati*: the demand that we face up to the 'beautiful chaos' of contingent existence and joyfully accept the historicity of the human condition with its attendant suffering, finitude and mortality, by shaping random events into the aesthetic unity of a unique self. Herzen's famous claim that 'the truly free man *creates* his own morality' has been likened to Nietzsche's assertion

that 'nothing is true, all is permitted': there is no reality independent of our shifting perspectives on it. But these parallels are misleading. Herzen did not live to engage with Nietzsche's irrationalism, but he unambiguously rejected the pessimism of Nietzsche's mentor, Schopenhauer, arguing that the vision of the world as a chaotic battleground of blind forces was a petulant overreaction to the failure of unjustified idealist expectations, a muddled transitional stage on the way to understanding reality without metaphysical preconceptions. As a corrective both to comforting illusion and exaggerated pessimism Herzen recommends to the student of history a training in the natural sciences that will inculcate 'true nihilism', which he defines as 'science without dogmas…the unconditional submission to experience and the resigned acceptance of all consequences, whatever they may be, if they follow from observation, or are required by reason' ([1861, 1866] 1968: 1764).

Herzen intended his reflections on history to serve as an object-lesson in this approach, spelling out what he regarded as the inescapable, but by no means wholly negative, consequences of the observable parallels between historical development and the chanciness of evolutionary processes. Against the pessimist he argues that experience reveals that chance operates within a framework of laws which allow us to calculate probabilities, to direct and control events within narrow boundaries, and even to progress, although not to utopia. When the anarchist (and former Left Hegelian) Bakunin pronounced the will to destroy as the creative force that would lead mankind to 'absolute liberty', Herzen accused him of a Romantic's disregard for the 'physiology' of historical and social development, the painful slowness of processes of growth in real time (see Bakunin, M. §2).

The shock and disbelief that greeted *On the Origin of Species* (1859), a decade after Herzen published *From the Other Shore*, testifies to the novelty and daring of Herzen's ideas on the dominant role of chance in nature and human life. In the furore over Darwin's opus, Herzen was among the first to grasp clearly the importance of the challenge that it posed to teleological thinking in all branches of intellectual activity, recommending it to Russian readers as an antidote to the extreme conservatism of most contemporary European thought.

Herzen's historical method owed much to the inspiration of an earlier innovator: Francis Bacon. In his philosophical writings of the 1840s he had stressed the significance of Bacon's analysis of those tendencies of the human mind that had to be corrected if knowledge were to be advanced, in particular the 'Idols of the Tribe' - the tendency to impose on external reality an order and a regularity that comes from the human intellect and does not belong to the world itself (see Bacon, F. §5). In his writings on history Herzen frequently cites Bacon's aphorisms on method, his demand that metaphysics be separated from science and his insistence on the barrenness of research into final causes, the '*magnum ignotum*' beyond the realm of knowledge. In 'Sur le libre arbitre' ('On Free Will'), his philosophical *prise de position* (in the form of a letter to his son) on the question of free will, it is Bacon ('an honest thinker') whom he cites in support of his attack on the dogmatically reductionist materialism of mid-nineteenth-century biological scientists. By declaring our sense of moral freedom to be an illusion, he argues, they had exceeded their competence: it was at the very least, an 'anthropological reality', without which we could not function as social beings. The dominance of dualistic systems had ensured that we possessed neither the words nor the categories to discuss the nature of choice in the nexus of contingency and invariant laws. But the purpose could be served by aesthetic metaphor: Herzen expresses the relationship between physical determinism and moral freedom through the distinction between a sound in isolation (a physical phenomenon subject to the laws of acoustics) and a sound in a musical phrase, where it 'acquires for us another value (or existence, if you like)'. This existence does not exempt it from the physical laws to which it is subject - the string may break and the sound will disappear, 'but as long as the string remains unbroken, the sound belongs not just to the realm of vibrations, but also to the realm of harmony where it exists as an aesthetic reality, functioning in a symphony which allows it to resound, dominates and absorbs it, and then abandons it in its wake'.

This unfinished symphony is the historical process, for which Herzen uses a related image in a fine passage in 'Robert Owen':

> having neither programme, set theme nor unavoidable *denouement*, the dishevelled improvisation of history is ready to walk with anyone; anyone can insert into it *his* line of verse and, if it is sonorous, it will remain his line until the poem is torn up, so long as the past ferments in its blood and memory.
>
> ([1861, 1866] 1968: 1245)

This notion of moral freedom bears little resemblance to Nietzsche's concept of the lonely Superman, asserting his will in defiance of history and human societies, which he identifies with the life-denying values of the herd.

Herzen believed that as social animals, human beings could achieve freedom only through a constant adjustment of their demand for self-fulfilment with their need for social solidarity - a model of freedom that has close parallels with Schiller's treatise *On the Aesthetic Education of Man* (1795). Like Schiller, Herzen believed that one should seek to govern one's conduct not by universal rational precepts but by the cultivation of an aesthetic sense of relationships that would allow one to respond to the demands of specific situations without either rigidly adhering to principle or blindly obeying the compulsion of instinct (see Schiller, J.C.F.).

Herzen pronounced Schiller's treatise 'a prophetic work…far in advance of its time'. One of its central themes - the 'fear of freedom' that drives individuals to seek to regulate their conduct by reference to transcendent authorities and universal norms - is the leitmotif of Herzen's writings on the nature of history. It is 'frightening' to abandon religious and secular concepts of predestination, to accept the ominous truth that it is absurd to apply our 'petty household rules', our human demands for intentionality and purpose, to the economy of the universe. The demystification of the world was a deeply painful process: but only those who had passed through that furnace, he maintained, could regard themselves as 'truly modern'.

3 Russian socialism

Herzen's interest in the structure and potential of the Russian peasant commune has been variously, but in general negatively, interpreted by historians. His belief that the commune contained the seeds of an advanced form of socialism has been represented as a messianic faith in flat contradiction with his critique of utopian thought, while his concern in the 1850s and 1860s with such matters as the methods of repartitioning land in the existing village commune has been described as a descent from the sublime to the ridiculous, from the great philosophical issues of *From the Other Shore* to the petty minutiae of peasant life.

Both types of charge were made against Herzen in his lifetime: the first by liberals who interpreted his faith in the commune's potential as a form of Slavophile messianic nationalism, and the second by socialists who demanded of him an inspiring vision of an ideal future. Herzen's response to both groups was to defend his view of the commune as wholly consistent with his view of freedom and the historical process.

Against the liberals he argued that, unlike the Slavophiles, he approached the commune not as a sign of Russia's superior destiny, but as a chance historical survival which might (although only if developed with the aid of Western technology and political theories) offer a solution to the most urgent problems facing both Russia and Europe: how to combine individual liberty with social cohesion, and to achieve economic development without mass pauperisation. While the commune might provide a way for Russia to pass to socialism without the trauma of mass industrialization, there was no guarantee that it would: socialism might be achieved both in Russia and the West by some quite different path, or not at all. He contrasts his 'prosaic' approach, focused on how best to balance individual aspirations and social needs at a given historical juncture, with the doctrinairism of the Russian liberals (who held that Russia's historical destiny was to discard the commune and follow the West along a common path to parliamentary democracy), and of those radicals who lived in expectation of a revolutionary leap to an ideal freedom. In the contempt of many progressive intellectuals for the primitive outlook of the Russian peasant and the imperfections of the existing commune he saw an instance of the teleological thinking that had been the principal target of his philosophical essays. He accused his critics of devaluing all aspects of contemporary experience that did not lead to their chosen goal, and respecting history and human liberty 'only in the future'. In 'K staromu tovarishchu', sometimes described as his political testament, he declares that his aim is to understand the size of the human pace in the present and, by substituting 'tact and inspired improvisation' for doctrinal consistency, 'to keep up with it, not falling behind, but not going so far ahead that it will not follow'.

4 Herzen's legacy

Herzen frequently remarked that his writings consisted of the constant repetition of a few simple truths, but that these truths were so repugnant to his contemporaries that they persisted in misconstruing them.

His message - that there were no ultimate solutions to the fundamental problems of human existence - has proven equally repugnant to Russian intellectuals in this century, leading to interpretations of his work that he would have repudiated. His ideas did not find favour among representatives of the Russian religious and philosophical renaissance of the early 1900s such as S.N. Bulgakov, who argued that his rejection of a transcendent world order

had led him ultimately (and inevitably) to a despairing nihilism. This view is echoed in V.V. Zenkovsky's authoritative history of Russian philosophy, which describes Herzen's thought as a philosophy of 'despair, hopelessness and disbelief'. Exceptions to this consensus were P.B. Struve (see Signposts Movement), who saw in Herzen 'one of our national heroes of the spirit' and the precursor of a new humanism, and Tolstoi, who noted in his diary that Herzen 'awaits his readers in the future. He imparts his thoughts far above the heads of the present crowd to those who will be able to understand him'.

The understanding of Herzen in his own country was not advanced by Lenin's canonization of him as the founder of the Russian revolutionary movement, an interpretation that was faithfully echoed by generations of Soviet historians. In the West his reputation has been slow to grow. As Isaiah Berlin argued in essays that brought Herzen to the attention of a wide English-speaking public, a condescending classification of his views 'as yet another variant of early socialism' left out the attack on utopian systems that was his most arresting contribution to political theory. At the end of the twentieth century we are better placed than Herzen's contemporaries to grasp the significance of that contribution. Herzen was among the first to predict a process with whose consequences we are only beginning to come to terms: the erosion of that faith in a purposeful universe in which all the basic assumptions of the great optimistic systems of his time (including Marxism) were grounded. He was more than just a precursor: his work remains relevant to contemporary debates in philosophy and cultural theory on the effect that the collapse of the 'grand narratives' of progress has had on traditional views of society, morality and the self. Herzen offers a clear alternative to two of the most common philosophical approaches to an inherently contingent world: Schopenhauerian pessimism and Nietzschean aesthetic immoralism. He has been compared to contemporary hermeneutic philosophers who argue that the historicity of the self does not render moral generalizations meaningless, and detect in history the unifying thread of a spiritual quest: the search to articulate our intuitive sense of the good. To those who felt themselves cast adrift in an unprogrammed world, he responded with the invigorating message that not only are freedom and moral responsibility possible in such a world: they are not possible in any other.

Heschel, Abraham Joshua (1907-72)

Born in Warsaw and educated there and in Berlin, Abraham Joshua Heschel moved to the USA in 1940, where he lived and taught for the rest of his life. His elegantly written books and essays and his striking personality made him a key figure in American Jewish philosophical theology after the Second World War. Written in German, English, Hebrew and Yiddish, his books reflect widely on the Hebrew Bible, Talmud and midrash, and on Jewish mystical writings, continuously engaging with contemporary philosophy and theology.

Born in Warsaw, the scion of a major Hasidic dynasty, Abraham Joshua Heschel was educated thoroughly in Bible, rabbinics, Kabbalah and Hasidism in his youth. After a brief period in Vilnius (Vilna, as it was known in Jewish letters), he studied philosophy at the University of Berlin and taught at the Hochschule für die Wissenschaft des Judentums in Berlin. He moved to the USA in 1940 and first taught at Hebrew Union College (the Reform rabbinical seminary) in Cincinnati and after 1945 at Jewish Theological Seminary (the Conservative rabbinical seminary) in New York for the rest of his life.

In his Berlin doctoral dissertation on prophetic consciousness, *Die Prophetie (Prophecy)* (1937), Heschel creatively used the methods of phenomenology, especially as applied to religious concerns by Max Scheler, to develop the concept of divine pathos that was to be a leitmotif of his subsequent thought. Where many medieval Jewish thinkers had adopted Hellenic ideas of God, most prominently those of Aristotle that assume divine eternity and impassivity, Heschel found the chief emphasis of the Hebrew Bible in God's concern for humanity (see Bible, Hebrew). Timelessness and perfection seemed to preclude any real divine concern with what is essentially temporal and imperfect. But in the God of the Hebrew Scriptures Heschel saw a pathos that was of the essence of prophetic consciousness and its inner sympathy with God's relation to the world.

Heschel's first major English work, *The Sabbath* (1951a), applied his phenomenological method at the core of Jewish piety, pointing out the primacy of time consciousness over space consciousness in Judaism. Heschel showed how the Sabbath addresses sacred time rather than sacred space. Out of step with the more pragmatic and worldly approach of many writers on religion, especially at the time of his writing, Heschel did not seek the value of the Sabbath in its worldly utility. Rather than appeal to secular values by describing the benefits of the Sabbath as a humane institution or a vehicle of socio-cultural continuity, Heschel introduced his readers to the spiritual needs that the Sabbath can address. Pressing the point, he went on to argue that the Sabbath is the only true antidote to the dehumanizing effects of unlimited technology.

In his next English book, *Man Is Not Alone* (1951b), Heschel sought to show the necessity of taking revelation seriously (see Revelation). The opening to this concern was what he called the sense of radical amazement: that is, the human realization that existence itself, our own and that of the world, cannot simply be taken for granted. Only when one sees that the world does not supply the answer to our most basic existential question 'Why is there something and not nothing?' can one be ready for the answer to that question that comes from the Source of the world, who radically transcends its being and all the categories devised to explicate its immanent processes. In thinking along these lines, Heschel shows especially the influence of his long philosophical friendship with Martin Buber.

Heschel's next major book, *God In Search of Man* (1955), contains the most significant statement of his thought and shows Heschel as the theologian he basically was. *Man Is Not Alone* was subtitled A *Philosophy of Revelation*, but the subtitle of *God In Search of Man* is *A Philosophy of Judaism*. He calls his method here 'depth theology', by which he means confrontation of the most basic human questions that religion addresses rather than the presentation of a dogmatic system. Following the fundamental assumption of phenomenology that all thought is about something other than itself, that thought is reflective not self-creative, Heschel presents the key doctrines and norms of classical Judaism as Israel's way of orienting itself towards God. Thus, in discussing the relations between Jewish law (*halakhah*) and reflection (*aggadah*), he argued, too many traditionalists see the law as an end in itself and adopt what Heschel called 'religious behaviourism'. They fail to realize that the religious obligations are part of the human response to the revelation of the transcendent God. Too many liberals, by contrast, see the Law as something arbitrary, to be supplanted in large part by inner religious attitudes. In a striking variation of Kant's famous dictum, Heschel writes: 'Halakha without aggada is dead, aggada without halakha is wild' (see

Halakhah). Throughout his career, Heschel portrayed Judaism as a complex of transcendent intent with immanent content. The categories he developed in *God In Search of Man* have lent themselves to a wide range of applications by later Jewish thinkers.

During his lifetime, Heschel was often described and sometimes dismissed as a mystic. If this means someone who claims to have unusual personal experience of the divine, then calling Heschel a mystic is empty and misleading. But Heschel certainly was influenced by the esoteric Jewish tradition of Kabbalah (see Kabbalah). He incorporated in his mature outlook much of the Kabbalah he learned in his youth, especially the Hasidic versions of it that stressed the human experience of the intimate presence of God, more than the esoteric theosophy of the earlier Kabbalah (see Hasidism). Although in his adult life he was no longer a Hasid in the strict sense of the word, Heschel was always deeply beholden to his spiritual roots. Indeed, his last book was the closest he came to returning to that world. It was a study, in Yiddish, his first spoken and literary language, of the thought of the outspoken nineteenth-century Hasidic master Rabbi Menachem Mendel of Kotsk.

One fundamental Kabbalistic idea that played a key role in Heschel's thought is that of 'divine needs': God not only wills that there be a world, he actually desires it and wants an ongoing relationship with it, as is manifest in the history of the people of Israel. The ultimate source of this divine need is a mystery beyond human ken, but it is the basis of God's reaching out to create. Thus humanity's response to God (through keeping the commandments of the Torah) answers not just to human needs but to those of God. Heschel's recourse to this classic Kabbalistic theme (see Nahmanides) allows him to offer insightful and spiritually moving explanations of many Jewish practices that some liberals found merely bizarre and that many traditionalists simply accept with a dulling kind of positivism.

Hesiod (*c.*700 BC)

One of the earliest surviving Greek poets, Hesiod was a direct precursor of the first philosophers. He composed one poem on mythic cosmogony and cosmology (Theogony) and another on work and justice in human life (Works and Days).

Little is known of Hesiod’s life, beyond what he tells us: his father emigrated from Asia Minor to Ascra in Boeotia and left him a share of an inheritance over which he quarrelled with his brother Perses, he won first prize in a poetic contest and the Muses themselves initiated him into poetry while he was tending sheep. The *Theogony* and *Works and Days*, which survive intact, are undoubtedly by him. Numerous other works were attributed to him in antiquity.

At least in part because Aristotle systematically distinguishes Hesiod as one of the earlier, mythical, philosophically unserious ’theologians’ from the later, more rational and philosophically interesting thinkers he calls ’physicists,’ most accounts of Greek philosophy tend to separate Hesiod from the Presocratics, assigning Hesiod’s poetry to the primitive phase of mythic thought and locating in Thales the beginning of genuine philosophical reflection in Europe. Yet Hesiod’s questions - What are the origin and structure of things? How can humans achieve success and happiness in their lives? - are the same ones that concern all later philosophers; and his answers, despite their often mythical form, remain of considerable interest.

In the *Theogony*, Hesiod attempts to unify many divergent local versions of Greek mythology by systematizing them all in terms of a coherent account of the origin and legitimacy of the current moral structure of the universe, identified with the rule of Zeus. Conceptual relations like implication, entailment or association are expressed mythologically as procreation or consanguinity, opposition or contradiction as warfare. Although Zeus’ rule was founded upon violence and crime in a succession of divine generations, it is now characterized by justice and order and is a welcome improvement upon earlier conditions. Human beings are a small but not quite negligible part of an extraordinarily complex and by now fairly stable world in which all natural and moral phenomena, including those viewed in a negative light, have a fixed place; cosmic forces of potential disorder remain, but they are at least temporarily under control and the threat of primitive anarchy they represent is remote.

Human existence becomes the central theme in Hesiod’s later *Works and Days*. Once again he uses myths to explain the origins of its permanent features: because of Prometheus labour is necessary; because of Pandora many evils plague human life; the sequence of gold, silver, bronze, heroic, and iron races demonstrates the relation between work, responsibility, and success. Now he adds numerous direct precepts and admonitions concerning social behaviour, religious practice and agriculture, and analyses the concept of *eris* (contention) to show that it can be not only baneful, when it leads to strife and war, but also beneficial, when it provides the impetus towards economic competition. It is Zeus’ rule of justice that distinguishes us from the animals and that ensures that, even though we are obliged to labour incessantly and to worry about an uncertain future, we can console ourselves with the reasonable hope that we not only will survive, but may even flourish, if we choose to face this obligation responsibly rather than try to prosper by immoral means.

Hess, Moses (1812-75)

Hess was a socialist philosopher, closely connected with the Young Hegelians, who influenced the initial philosophical development of Karl Marx, and later articulated, in the context of a critique of European bourgeois society, one of the first calls for the re-establishment of a Jewish commonwealth in Palestine.

Hess was born to a Jewish family in Bonn, Germany. At an early age he repudiated the religious teachings of his parental home and under the influence of Spinozist, Young Hegelian and Feuerbachian ideas developed a highly original, though philosophically eclectic, socialist philosophy (see Feuerbach, L.A.; Hegelianism §2).

His first book, *Die heilige Geschichte der Menschheit (The Holy History of Mankind)* (1837) proposes a three-stage philosophy of history (God the Father, God the Son and the Holy Spirit) based on the changing relationship between politics and ethics, to culminate in a new, socialist ‘New Jerusalem’. This new order, based on the abolition of private property, will reintroduce into politics those ethical elements banished from human life due to the Christian dichotomy between the material and the spiritual which enabled the emergence of individualist capitalism. In a further publication, *Die Europäische Triarchie (The European Triarchy)* (1841) he sees the cultures of France, Germany and England symbolizing, respectively, radical political, philosophical and industrial innovation, as the foundation of a new progressive alliance against the conservative post-1815 reality in Europe.

Active in the radical intellectual movement which included alsoMarx and Engels,Hess went into exile, to Belgium and France. In numerous essays, such as ’Die Philosophie der Tat’ (’The Philosophy of the Deed’) (1843), *Über das Geldwesen (On Money), Über die sozialistische Bewegung in Deutschland (On the Socialist Movement in Germany)* (1845) and ’Die letzten Philosophen’ (’The Recent Philosophers’) (1845), he continued to develop his brand of ‘ethical’ socialism, slowly differentiating his approach from the ‘materialistic’ approach of Marx and his followers.

After a short return to Germany during the 1848-9 revolution, Hess spent the rest of his life in Paris. There, under the impact of the rise of national movements in Germany and Italy in the wake of the failure of 1848, he also developed his own thoughts on the future of the Jews and Jewish civilization. In his earliest writings he expressed the view that the socialist revolution will also integrate Jewish life into the new revolutionary Europe; but Hess always recognized the salience of national identity in the course of world history. The rise of nationalism in Europe led him to the conclusion that only the renewal of Jewish political life in the ancestral land of Israel could guarantee both an adequate social solution to the Jewish problem and the survival of Jewish culture. Greatly influenced byMazzini’s ideas of a universalist, harmonious nationalism, Hess developed these ideas in his book *Rom und Jerusalem (Rome and Jerusalem)* (1862). The socialist structure of this Jewish commonwealth would be based both on universalist principles and on the strong socially-orientated precepts whichHess, despite his religious agnosticism, found underlying much of the historical Judaic biblical legislation. His book - rather idiosyncratic and hardly noticed at the time of publication - was later to become one of the major intellectual texts of Zionism, especially in its socialist variation.

In his later years Hess tried to develop, on Spinozist lines, a modern philosophy of science with radical, socialist-activist implications; but the work was never finished. He died in Paris on 6 April 1875 and was later to become the only thinker revered by both the socialist and Zionist movements.

Because of his philosophical eclecticism, Hess never produced a systematic body of work comparable to that of other socialist thinkers, such as Saint-Simon or Marx. Yet his interpretation of Spinoza’s monism and pantheism can be seen as the mainstay of both his socialist and proto-Zionist ideas (see Spinoza, B. de). Similarly, because of this lack of a systematic doctrine, Hess was more receptive to a pluralist interpretation of history, which gave a role to issues of national identity and cultural tradition, generally overlooked by more systematic thinkers like Marx.

The unity of matter and spirit which Hess discerns in Spinoza serves him as the foundation of his ethical socialism: economic life cannot be divorced from ethical considerations, nor can ethics be relegated to a separate compartment (‘religion’), purely focused on an other-worldly redemption (whichHess saw as the main characteristic of Christianity). That the historical Jewish legislation institutionalized this unity of politics and

ethics in the concept of a 'holy nation' Hess saw (when shorn of its ethnocentric connotations) as the specifically socialist element embedded in Judaism, in contrast to the dichotomies of Christianity, which have led to competitive individualism, alienation and capitalism.

Many of Hess' ideas on alienation in modern industrial society, on money as 'reified' power dominating the lives of human beings who created it, found their way, via Marx, into the general canon of socialist critique. But because of his eclecticism Hess was free from the reductionist flaws of Marxian thought. Similarly, his recognition of both the autonomy and intrinsic value of culture as embedded in specific national memory and identity saved him from the abstractedness and lack of understanding for national problems which characterized much of socialist thought. Echoes of Hess' thought can be found among the so-called 'Austro-Marxist' thinkers, in the Yugoslav attempt, under Tito, to combine socialism with a multi-ethnic reality, and in socialist Zionism.

Hessen, Sergei Iosifovich (1887-1950)

Sergei Hessen, a disciple of Rickert, has been described as 'the most brilliant and philosophically gifted' representative of Neo-Kantian transcendentalism in Russia on the eve of the Revolution. A co-editor of the St Petersburg-based philosophical journal Logos, he represented a distinctively Westernizing trend, critical in many respects of the openly metaphysical religious idealism of the 'religious-philosophical renaissance' in Russia. However, he readily acknowledged the existence of an ineradicable metaphysical need in human beings and stressed the metaphysical relevance of his philosophy of moral and cultural values. B.V. Iakovenko attributed to him a pronounced 'ontological aspiration' and Hessen's philosophical evolution led him beyond 'pure anthropologism', towards a religiously tinged Platonism.

Like many Russian philosophers, Hessen concentrated on philosophical problems which had direct relevance for practice. His main fields were philosophical pedagogy, which he defined as 'applied philosophy', and political philosophy, with particular emphasis on philosophy of law. Like many other Russian philosophers, he was forced to emigrate, moving from one country to another, which did not help his professional career. Nevertheless, his work Osnovy pedagogiki (Foundations of Pedagogy) (published in Berlin, 1923) was translated into many languages and won him international recognition as the main author of the 'pedagogy of culture'. His original conception of 'rule-of-law socialism' (which deserves to be regarded as the last link in the legal philosophy of Russian liberalism) was much less known, and the manuscripts of his two books on political philosophy perished in the Warsaw uprising of 1944. Still, the UNESCO Committee on the Philosophic Basis of Human Rights invited him to contribute to the preparation of the Universal Declaration of Human Rights of 1948. His article for UNESCO, together with his writings on political philosophy published posthumously in Italy, were a Russian contribution to the philosophy of human rights in modern, liberal democratic states.

1 Philosophy of values

Sergei Iosifovich Hessen was a son of a Russian lawyer who became the editor of the St Petersburg journal *Pravo (Law)* and a prominent member of the Kadet Party. Owing to this Hessen grew up surrounded by the best representatives of Russian liberalism and the legal profession (P. Miliukov, L. Petrażycki and others). He studied philosophy in Germany under the direction of Heinrich Rickert (see Neo-Kantianism §§6-8). His doctoral thesis, *Individuelle Kausalität (Individual Causality)*, was defended *summa cum laude* in 1908 and published in Kantstudien. Having returned to Russia, he edited *Logos* (together with F. Stepun) and lectured at St Petersburg University (see Neo-Kantianism, Russian §6). In 1917 he was a personal secretary of Plekhanov. After the Revolution he served for four years as a professor of philosophy in Tomsk but the increasing ideological pressure made it impossible for him to continue his work in Russia. He emigrated to Berlin and then to Prague, where he lectured in the Russian Pedagogical Institute. In 1935 he moved to Poland, on the invitation of the Free University in Warsaw. During the war he took an active part in the underground university courses in Warsaw. After the war he resumed his professional duties in the newly created University of Łódź.

The intellectual situation of the early twentieth century was defined by Hessen as a double crisis: the crisis of philosophy and the crisis of liberalism, both caused by the undermining of the belief in the objectivity of truth and in the objectivity of values. He wanted to overcome this philosophical and political crisis without returning to naïve scientific and moral dogmatism, and without resuscitating the rationalistic and class-bound illusions of classical liberalism.

In his efforts to do this Hessen made use of a peculiar variant of dialectical method. He attributed its discovery to Plato. In his interpretation dialectic was a means of combating relativism and saving values from destruction: it enabled him to detect continuity and permanence in historical change, to see in the realm of the relative a reflection of the absolute. 'Dialectical comprehension' was to him a combination of the historical approach with phenomenological 'eidetic insight', and the ontological foundation of dialectics was, in his view, the Neoplatonic idea of 'All-Unity' - an idea which, thanks to Solov'ëv, became strongly embedded in Russian religious philosophy.

Under the influence of Roman Jakobson's Linguistic Circle in Prague (see Structuralism in linguistics §2), Hessen turned his attention to structuralism and made 'the principle of structure' an integral part of his dialectical method.

His concept of structure was composed of three elements: (1) the idea of wholeness, levelled against nineteenth-century atomism; (2) the idea of a 'hierarchy of layers', levelled against genetic reductionism; and finally (3) the idea of autonomy, levelled against naturalism and psychologism. All these components were combined in a dialectical relationship which prevented the distorting isolation and absolutization of any, thereby removing the danger of interpreting wholeness as totalism and autonomy as autarchy.

In his *Osnovy pedagogiki (Foundations of Pedagogy)* (1923) Hessen developed a conception of personality as rooted in objective, universal values. Personality, he claimed, is discovered only by participation in suprapersonal tasks. Without having physical existence, values have, nonetheless, 'universal validity'; hence, their mode of being is independent both from the individual psyche and from the supra-individual collective consciousness. Their objectivity and universality consists in their 'inner quality' which can be neither deduced from social conditions nor made dependent on their subjective recognition by a social group. In contrast to the norms of social life, cultural values act not by means of pressure but by means of 'appeal' - an appeal directed to people as free spiritual beings or personalities. The world of values is a hierarchical, multilayered structure; the higher values 'glow through' the lower ones and the lower values are both negated and preserved in the higher. History is a process of realizing values but the 'inner quality' of values is independent of changing historical situations. Philosophy is the self-consciousness of man as a value-realizing or - which means the same - a culture-producing being. The practical application of philosophy is pedagogy, or the science of education.

In later years Hessen tried to transcend this 'purely cultural' standpoint by developing the idea of a supracultural level of human existence. The first outline of this new conception appeared in his book *O sprzecznościach i jedności wychowania (On Contradictions and Unity in Education)* (1939). It divided human existence into four levels: biological, social, cultural (spiritual), and the level of grace. Hessen explained that the highest level was equivalent to the 'Kingdom of God' in the conception of such religious philosophers as Solov'ëv and August Cieszkowski.

The appearance of a religious perspective in Hessen's thought resulted from his deep interest in Russian religious thinkers, above all Solov'ëv and Dostoevskii. From Solov'ëv he took the idea of 'All-Unity', setting it against both atomistic pluralism and ossified monism; his criticism of isolating and absolutizing certain elements of a dialectical whole was directly related to Solov'ëv's criticism of 'abstract principles'. Dostoevskii was for him the greatest Russian thinker, whose works, especially *The Brothers Karamazov*, provided the formulation and intuitive solution of the deepest problems of modern ethics.

Hessen's articles on Dostoevskii and Solov'ëv show both his relative closeness to the broadly conceived 'religious-philosophical renaissance' in Russian thought (see Russian Religious-Philosophical Renaissance) and the peculiarity of his standpoint, clearly distinguishing him from other Russian thinkers inspired by Solov'ëv's philosophy. In his interpretation of Solov'ëv Hessen was a resolute Westernizer, having nothing to say on the 'Russian Idea'. He minimized the importance of Solov'ëv's theocratic utopianism, stressing instead the presence of Kantian motives in his philosophy and crediting him with overcoming utopian tendencies. Similarly, Hessen saw in Dostoevskii not a messianic utopian but rather a profound critic of utopianism, a thinker who powerfully and prophetically foretold the inevitable totalitarian consequences of utopian thinking.

In his essay 'Krushenie utopizma' ('The Breakdown of Utopianism') (1924) Hessen defined utopianism as 'absolutization of the relative': attributing absolute significance to the realization of certain relative values and setting them against the entire historical tradition. This explained, in particular, the nihilistic and purely instrumental attitude towards law, so characteristic of the utopian mentality.

2 Rule-of-law socialism

In Hessen's view, the most important modern utopia was, of course, socialism. He brilliantly analysed the destructive nature of socialist utopianism but stressed, at the same time, that socialism should not be reduced to its utopian features. In the serialized book *Problema pravovogo sotsializma (The Problem of Rule-of-Law Socialism)* (1924-7) he argued for the possibility of overcoming socialist utopianism from within, through combining socialist ideas with the liberal principle of the rule of law.

The first phase of socialism - 'Utopian socialism as the abstract negation of capitalism' - was a reaction against the juridical worldview of the French Revolution. It rejected the rule-of-law state as legalized anarchy, accused the

law of sanctifying social atomization and set against it the principle of the Good. According to Saint-Simon and his disciples law was necessarily subjectivist, pluralist and purely formal, whereas the good was objective, monistic and had a concretely definable content. Socialism, therefore, was conceived not as yet another political system, yet another legal order, but as an organic industrial system in which political power is replaced by the administration of things, and law, as a means of delimiting subjective, egoistic interests, gives way to organic social ties.

The second phase of socialism - classical Marxism - was described as a ‘real’ negation of liberal-capitalist order. It was real, and not merely abstract, because of the scientific character of Marxian analyses of the real contradictions of capitalist development. However, this scientific side of Marxism coexisted with a pronounced hostility towards the rule of law, defined as bourgeois hypocrisy, and with a strong strain of utopianism, culminating in the idea of the ‘withering away of state and law’. Another side of the Marxist utopia was the idea of the disappearance of economy or, rather, its replacement by a purely technical scientific organization of labour.

Russian revolutionary communism represented, in Hessen’s view, the quintessence of Marxist utopianism. Its inner nature was revealed by ‘War Communism’, that is, the subordination of all spheres of life to the militarized control of those in power. The degradation of law in the Soviet state revealed another aspect of the communist utopia: its striving by all possible means to realize an arbitrarily defined and absolutized ideal of positive Good.

The next part of the book is devoted to those currents of socialist thought, both Marxist and non-Marxist, in which the negation of capitalism was not only ‘real’, that is, derived from an analysis of real social contradictions, but also ‘transforming’ and ‘constructive’. Following P.I. Novgorodtsev (see Neo-Kantianism, Russian §4), Hessen discussed in this part both individual thinkers, such as Lassalle, Proudhon and Bernstein, and entire movements, such as French Syndicalism and German social-democratic revisionism. He presented them as different dialectical phases of the process by which the socialist Good was permeated by the principle of law.

In the last part of the book Hessen discussed the views of the British ‘guild socialists’ who defined their socialist ideal as ‘the New Middle Ages’. He welcomed this ideal with important qualifications, stressing that ‘the truth of liberalism’ had to be preserved. Referring to Chicherin (see Liberalism, Russian §2) he pointed out that law should not be confused with morality, as had been the case in the ‘Old Middle Ages’, and assured his readers that in the new medievalism the ‘impenetrability of the person’ and inviolable rights of the individual would be fully respected.

The essence of the new medievalism would consist in the sovereignty of law and plurality of legal orders mutually limiting each other. Law would no longer be identified with the official laws of the state and the state itself would undergo a process of ‘devolution’. Social atomization would be abolished, individuals would participate in the life of different communities without losing their individual autonomy. Property would lose its alienated character and become personalized, conditional and divided. The economy would be ‘bridled’ by law while preserving its autonomy and spontaneity. Human dignity would gain enormously because being dependent on law, rather than on arbitrary political power or blind economic forces, is not a humiliating relationship. In this way socialism would at last fully overcome its utopianism and reveal itself as a new and higher form of the rule of law.

3 Human rights and philosophy of law

In his works written under the Nazi occupation and under the communist rule in Poland (such as his UNESCO article and the booklet *Modern Democracy*) Hessen gave up his idealization of the pluralist legal order of the Middle Ages but further developed his conception of socialism as the last stage in the development of human rights and the rule of law.

In the first stage, represented by the absolute state, human rights took the form of the security of law, which implied the inviolability of the citizen’s person, property and dwelling. In the second stage, that of classical liberalism, security of law was transformed into the liberal principle of limited government, safeguarding the existence of a private sphere in which individuals were free from any interference by the state. The third stage - the modern democratic state - broadened the scope of governmental activity by endowing the state with the task of securing for its citizens certain forms of ‘positive freedom’. This provided justification for welfare policies, universal compulsory education and different kinds of social insurance. Socialism represented the fourth stage in this development. Its task was the further extension of ‘positive freedom’ and democratic rights through endowing all individuals with economic rights and safeguarding their implementation. Its highest principle was to be freedom

from exploitation or the right of everyone to be treated in economic life as a person, not a mere commodity.

The Soviet system, in Hessen's view, was a product of the destructive spirit of communist utopianism. Nevertheless he saw in it an encouraging phenomenon: the gradual overcoming of its initial utopianism, the vindication of some measure of autonomy for the economic sphere, the restoration of law and an increasingly positive attitude towards the historical heritage. He expected therefore that sooner or later the Soviet Union would develop into a democratic and law-respecting socialist state.

Hessen's views on the current state of affairs in the liberal-democratic West stemmed from his conviction that liberalism had entered the phase of its final, insoluble crisis. The Western countries, he argued, had abandoned the Puritan values of the fathers of liberalism; hence the prevalence of consumerist attitudes, a special kind of tolerance, expressing not respect for persons but indifference towards truth, and the peculiar infantilism of mass culture. Hessen saw these phenomena as symptoms of a dangerous, destructive process. It seemed to him that the overcoming of such a crisis could be expected only from an overall regeneration: from religious revival on the one hand and from socialist reconstruction on the other.

Hessen's conception of the changing content of human rights was linked to his general philosophy of law, elaborated in his unpublished book 'On the Essence and Calling of Law'. It placed law between two levels of human existence: the social level and the spiritual/cultural level. Law is below the spiritual level because it lacks *eros* and *caritas*: it replaces moral values by commands, attraction by pressure, autonomy by heteronomy. On the other hand, however, law stands above the social level of existence, since it is a means by which spiritual life influences its social basis. Without law members of a social group cannot become individualized persons. Absolutization of the legalistic outlook leads to atomism but disregard for law in the name of higher moral principles results, as a rule, in descent to the animal level.

In the last two years of his life Hessen was a victim of the enforced Stalinization of Polish intellectual life. He was subject to increasing ideological pressure and forced thereby to withdraw from teaching philosophy and pedagogy, becoming instead a teacher of Russian. After his death several of his works were translated into Italian and influenced Italian educational policies.

Heytesbury, William (before 1313-1372/3)

William Heytesbury, an English logician of the mid-fourteenth century, is, with Richard Kilvington, Richard Swineshead, Thomas Bradwardine and John Dumbleton, one of several philosophers known as the Oxford Calculators. In his works, Heytesbury examined mathematical topics related to motion and the continuum as well as paradoxes of self-reference and problems arising from intentional contexts, all within the context of terminist logic, through the resolution of sophismata. He is most noted for developing the mathematics of uniform acceleration, and for his contributions to developing the mathematical treatment of physical qualities such as heat.

William Heytesbury became a fellow of Merton College in 1330. He was a foundation fellow of Queen's College in 1340, but soon returned to Merton, becoming a doctor of theology there in 1348. He served as Chancellor of Oxford University in 1371-2, just before his death. All of his works concern logic and were written in Merton College during his Regency in Arts (1331-9). His writings were particularly popular in fifteenth-century Italy.

Heytesbury's logical investigations centred on sophismata, as his two major works, *Sophismata* and *Regulae solvendi sophismata (Rules for Solving Sophismata)* reveal in their titles. A sophisma is not a sophistical argument, but a statement the truth of which is at issue, given certain assumptions specified within a disputation (see Language, medieval theories of). The respondent must take a position on the statement's truth, and answer his opponent's questions for a certain time without being driven into absurdity or contradiction. Medieval sophismata were intended to be of logical interest, and may pose important philosophical problems.

Regulae solvendi sophismata has six chapters. The first deals with 'insoluble' sentences, self-referential paradoxes such as 'what I am now uttering is false'. The second, 'On knowing and doubting', deals with sentences involving intentional contexts, such as 'You know the king is seated', when the king is seated, and 'you know that sentence A (asserting this) is true, but you do not know what A asserts'. The third chapter deals with sophismata involving relative pronouns, and the fourth with sentences involving the terms 'begins' and 'ceases'. The fifth, 'On maxima and minima', deals with sentences concerning the limits of capacities measured on linear continua, and the sixth with sentences about change and motion.

The first three types of sophismata raise logical questions, but the rest border on mathematics and physical theory in their discussion of continua and motion. Heytesbury first makes a sophisma's logical form clear, using a variety of tools, and then applies the conditions specified to the determination of its truth. As an example, take 'Socrates ceases to know ten propositions', given that he now forgets one of the propositions but continues to know the other nine. The logical form of the sophisma is unclear on the surface, but William 'exposits' it as 'Socrates knew ten propositions immediately before now, but does not know ten propositions now'. Given that exposition, the sophisma follows. The objection that he ceases to know only one proposition, and continues to know the other nine, is handled by pointing out that 'ceases' imposes a compounded, not a divided, sense on 'ten propositions', since it precedes that phrase. The sophisma is not 'ten propositions (each) cease to be known by Socrates', which involves the divided sense and would receive a different exposition.

Again, take a proposition stated in the chapter on relative pronouns, 'Now there begins to be some instant which after the present instant will begin to be'. The exposition yields 'Now there is no instant which after the present instant will begin to be, and immediately after now there will be some instant which after the present instant will begin to be', and so the sophisma is true. The second part of the exposition is taken to mean 'there is no instant after the present instant such that at no instant between it and the present instant there is some instant which after the present instant will begin to be'. In his *De sensu compositio et diviso (Compounded and Divided Senses)*, an important summary of the state of the question on the issues it discusses, and on which medieval logicians afterwards relied, Heytesbury denies that from 'immediately after this there will be some instant', one may conclude that 'there will be some instant immediately after this', relying, as he often does, on word order to make his distinctions. In the first case, 'immediately' comes before 'some instant', and renders its supposition confused, so that what is said is 'there is no instant after the present instant such that at no instant between it and the present instant *there is some instant*'. In the second case 'immediately' comes after 'some instant', so that its supposition is not confused, and the sentence means that, for some specific instant I, 'there is no instant after the present instant such that at no instant between it and the present instant *I is*'. Thus, whereas the first is true, the second is false.

Heytesbury's central concern is often the logic of continual and infinite divisibility, a pursuit we nowadays regard as a part of mathematics. In constructing his sophismata, he makes free use of whatever can happen *secundum imaginationem*, that is, any set of conditions or events involving no formal contradiction, whether or not it is physically or metaphysically possible. (Thus the reductionism characteristic of his nominalism is disabled, and Heytesbury neither attempts to explain how an instant is really identical with things in motion, nor avoids speaking of instants merely because they are not really distinct from such things.) Despite their abstraction, these investigations contributed to the development of the natural sciences. In Aristotelian physics only space, time and motion are considered amenable to mathematical treatment. However, William's sophismata conceive qualities such as heat and whiteness in quantitative terms, while avoiding any metaphysical difficulties in such a conception by proceeding *secundum imaginationem*. As thinkers became used to the notion that anything lying along a continuous range could, in principle, be spoken of quantitatively, the search for a way to measure such things as heat became possible, and so mere logic laid the groundwork for a broadened application of mathematics to the physical world.

In the sixth chapter of his *Regulae*, Heytesbury developed the mathematics of uniform acceleration, proving the mean-speed theorem, in other words that a uniformly accelerated body will, over a given period of time, traverse a distance equal to the distance it would traverse if it were moved continuously in the same period at its mean velocity (one-half the sum of the initial and final velocities) during that period. He derives from this the conclusion that a uniformly accelerated body will, in the second equal time interval, traverse three times the distance it does in the first. Domingo de Soto observed the applicability of the theorem to free fall in 1555. Galileo, although he probably was not acquainted with Heytesbury's work, would have benefitted from the medieval background of which Heytesbury was a part (see Galilei, G.).

List of works

William Heytesbury (1331-9) Works, in *Tractatus de sensu composito et diviso, Regulae solvendi sophismata, et cetera*, Venice: Bonetum Locatellum, 1494.(This includes also *Sophismata* and *De veritate et falsitate propositionis (On True and False Propositions)* and commentaries by Gaetano of Thienne. See Wilson (1960) for additional editions and manuscripts.)

William Heytesbury (1331-9) *Sophismata asina (The Asinine Sophismata)*, ed. F. Pironet, Paris: Vrin, 1944.(An early collection of sophismata each of which proves the proposition, 'You are a donkey' (*Tu es asinas*). Edition, commentary and full manuscripts; the only modern edition of any of Heytesbury's works.)

William Heytesbury (1331-9) *De sensu composito et diviso (The Compounded and Divided Senses)*, trans. in N. Kretzmann and E. Stump, *The Cambridge Translations of Medieval Philosophical Texts*, Vol. 1: *Logic and the Philosophy of Language*, Cambridge: Cambridge University Press, 1988.(An accurate and logically sensitive translation with a brief introduction.)

William Heytesbury (1331-9) *De probationibus conclusionum tractatus regularum solvendi sophismata (On the Proofs of Conclusions from the Treatise of Rules for Resolving Syllogisms)*, Pavia, 1483.(Includes work on the speed of uniformly accelerated bodies.)

William Heytesbury (1335) *Regulae solvendi sophismata (Rules for Solving Sophisms)*: Chapter 1 trans. P.V. Spade, Toronto, Ont.: Pontifical Institute of Medieval Studies, 1979; Chapter 2 trans. 'The Verbs "Know" and "Doubt", in N. Kretzmann and E. Stump, *The Cambridge Translations of Medieval Philosophical Texts*, Vol. 1: *Logic and the Philosophy of Language*, Cambridge: Cambridge University Press, 1988; Chapter 5 trans. J. Longeway in *William Heytesbury: On Maxima and Minima. Chapter 5 of Rules for Solving Sophismata with an anonymous fourteenth-century discussion*, trans. J. Longeway, Dordrecht: Kluwer, 1984.(Chapter 1 deals with self-referential paradoxes; Spade's translation and commentary is intelligent and well-informed. Chapter 2 deals with, among other things, logical problems raised by internal contexts; not much commentary, but the translation is accurate and logically astute. The translation of Chapter 5 contains a study and extensive analytical notes, arguing especially for the mathematical character of the work.)

Hierocles (2nd century AD)

The Stoic philosopher Hierocles lectured and wrote on ethics. He is important for his defence of the theory of oikeiōsis *(affiliation), a form of self-perception and self-love which becomes the foundation for human commitment to rationality and virtue. Observation of animal and human behaviour, he argues, shows that* oikeiōsis *is innate, rather than learned.*

Little is known of Hierocles' life. He should, however, be distinguished from the later fifth-century Neoplatonist of the same name. When von Arnim demonstrated the common identity of the author of a papyrus text (known now as *Foundations of Ethics*) and the author of ethical excerpts preserved in a late ancient anthology by Stobaeus, it became apparent that Hierocles was active as a philosophical lecturer, in Asia Minor and/or Athens, in the second century AD (a date confirmed by the dating of the papyrus). The excerpts, of which more than a dozen survive, are from discourses on topics in practical ethics (for example, family relations, marriage, civic duty, household management) and on religion, and resemble lectures by other Stoics such as Musonius Rufus and Antipater. *Foundations of Ethics* deals in a more technical manner with the doctrines of self-perception and *oikeiōsis* (affiliation) (see Stoicism §14) and provides philosophical arguments for the view that self-perception is the basis for our affiliation to ourselves.

Foundations preserves evidence about Stoic views on perception and self-awareness, the nature of the soul, and the 'self' as a complex relation of soul to body. It also sheds light on the problem of reconciling the self-directed inclinations of humans (self-love, the natural desire for one's own virtue to thrive) with the social inclinations which are the basis of the other-regarding virtues. Hierocles recognizes three affiliations: to oneself, to other humans, and to appropriate external objects.

One of the discourses (which can be found in von Arnim and Schubart, 1906: 61-2) also sheds light on our relations with others. People should be thought of as being arranged around us (that is, our mind) in a series of concentric circles. In the first and closest circle is our own body and the external things which help to fulfil its needs. The second circle contains our immediate relatives: parents, siblings, wife, children. The next two circles contain other relatives in order of closeness. The circles which follow include the various degrees of civic relationship (deme, tribe, city). Last is the circle of the entire human race. Hierocles proposes that social relations will be improved if we try to treat each group as though it were closer to us than it really is. He also suggests addressing remote relatives by more intimate labels (calling our cousins brothers, for example) in order to demonstrate and to strengthen our feeling for other people. The goal of this exercise is not to treat all human beings as we treat ourselves, but rather to 'reduce, through our own effort, the remoteness of our relationship with each set of people'. Hierocles' theory aims to achieve the closest possible bonds between people, but he falls short of calling for genuine altruism or impartialism.

Hilbert's programme and formalism

In the first, geometric stage of Hilbert's formalism, his view was that a system of axioms does not express truths particular to a given subject matter but rather expresses a network of logical relations that can (and, ideally, will) be common to other subject matters.

The formalism of Hilbert's arithmetical period extended this view by emptying even the logical terms of contentual meaning. They were treated purely as ideal elements whose purpose was to secure a simple and perspicuous logic for arithmetical reasoning - specifically, a logic preserving the classical patterns of logical inference. Hilbert believed, however, that the use of ideal elements should not lead to inconsistencies. He thus undertook to prove the consistency of ideal arithmetic with its contentual or finitary counterpart and to do so by purely finitary means.

In this, 'Hilbert's programme', Hilbert and his followers were unsuccessful. Work published by Kurt Gödel in 1931 suggested that such failure was perhaps inevitable. In his second incompleteness theorem, Gödel showed that for any consistent formal axiomatic system T strong enough to formalize what was traditionally regarded as finitary reasoning, it is possible to define a sentence that expresses the consistency of T, and is not provable in T. From this it has generally been concluded that the consistency of even the ideal arithmetic of the natural numbers is not finitarily provable and that Hilbert's programme must therefore fail.

Despite problematic elements in this reasoning, post-Gödelian work on Hilbert's programme has generally accepted it and attempted to minimize its effects by proposing various modifications of Hilbert's programme. These have generally taken one of three forms: attempts to extend Hilbert's finitism to stronger constructivist bases capable of proving more than is provable by strictly finitary means; attempts to show that for a significant family of ideal systems there are ways of 'reducing' their consistency problems to those of theories possessing more elementary (if not altogether finitary) justifications; and attempts by the so-called 'reverse mathematics' school to show that the traditionally identified ideal theories do not need to be as strong as they are in order to serve their mathematical purposes. They can therefore be reduced to weaker theories whose consistency problems are more amenable to constructivist (indeed, finitist) treatment.

1 The formalism of the geometric period

Hilbert's conception of mathematics during the period of his work on the foundations of geometry was 'formalist' in the sense that it viewed an axiomatic system as providing not a family of truths specific to a particular subject matter but, rather, a 'theory-form' or hypothetico-deductive framework which potentially and, indeed, preferably served as the form for a variety of different particular sciences.

This doctrine has two distinct moments that it is important to distinguish. One is a 'rigourist' moment which maintains that, for the sake of achieving rigour in mathematical reasoning, axiomatic systems must be formalized to the point of emptying their distinctively mathematical concepts of all intuitional or distinctly mathematical content so that they become mere 'positions' in a network of logical relations. The other moment is a 'schematist' one which says that even for the sake of achieving truth in one's axioms, the non-logical terms in an axiomatic theory do not have to be tied to any particular intuitive content. Conceived in this way, the mathematical terms of an axiomatic theory become 'variables' of a sort (that is, terms that range over a variety of different intuitive contents) rather than 'constants' (that is, terms that signify a unique particular content).

Historically, the rigourist moment had its origins in the seventeenth-century discovery that various proofs in Euclid's *Elements* relied upon assumptions not stated in his axioms, postulates and definitions. In the eighteenth century, Lambert (1766: 162) proposed a remedy for such failures of rigour. He reasoned that since they occur when one makes tacit use of geometric intuition while conducting an inference in a proof, they ought to be eradicable by forcing all inferences to be validated without appeal to geometric intuition. This, he maintained, could be accomplished by requiring the validation of inferences to proceed in abstraction from the intuitive meanings of the mathematical terms involved and to be warranted solely on the basis of their 'symbolic characteristics'. Axioms would thus be treated like 'algebraic equations' in which mathematical terms are manipulated according to the logical positions laid down for them in the axioms and not according to their intuitive meanings.

This, essentially, was the conception of rigour that Pasch (1882) and Hilbert (1899a) put into effect in their axiomatizations of geometry a century later.

Inference, however, is only one part of mathematical practice and rigour, therefore, only one of its goals. Traditionally, it has also been required that the theorems, and, hence, the axioms, be true. To satisfy this goal, however, would seem to require treating the mathematical terms occurring in the axioms from the point of view of their intuitive meanings or contents. Such, at any rate, is the traditional view. The schematist moment of Hilbert's formalism challenges this view by maintaining that, ideally, a system of axioms should have a number of different (important) realizations and that these different realizations should be obtainable from one another by relatively simple schemes of interchange of the meanings of the non-logical terms in the axioms. What is most important, then, is for a system of axioms to have not one particular realization but a variety of different ones.

This interesting view is sometimes distorted and misrepresented by saying that Hilbert defined truth as consistency or that he advocated mere consistency rather than truth (as ordinarily defined) as the goal of mathematical theorizing. Hilbert sometimes said things that encourage such readings (1899b: 39-40, 1900: 448, 1905: 125, 1922: 157). However, more careful consideration of the ideas that influenced his views together with a balanced reading of the texts themselves (1922: 162-5, 1923: 179-80; Hilbert and Bernays 1934: §1) indicates that this was not his position.

This type of formalist view was suggested by a striking phenomenon of nineteenth-century geometry - the so-called 'dualities' that emerged in projective geometry. Generally speaking, a duality is a pair of theorems one of which can be obtained from the other by a simple and uniform scheme of substitution of geometric terms. Among the simpler examples are the following pairs of propositions:

(1) For every two distinct points, there is exactly one line which is incident with both.
(1′) For every two distinct lines, there is exactly one point which is incident with both.
(2) For every three points that are not incident with the same line, there is exactly one plane with which they are all incident.
(2′) For every three planes that are not incident with the same line, there is exactly one point with which they are all incident.

(1′) results from (1) by interchanging 'point' and 'line'. They illustrate a general principle - the principle of duality for the projective plane - that covers many more instances. Similarly, (2) and (2′) illustrate the principle of duality for projective space. (Statements (1′) and (2′) are not true for ordinary or 'metric' geometry, of course, but only for geometries in which the usual elements are augmented by various ideal elements such as points and lines at infinity.)

In addition to these simple and basic dualities, there are many others, some quite striking. They include a duality linking theorems of the Riemannian geometry of the plane to theorems of the Euclidean geometry of the sphere under interchange of the terms 'straight line' and 'great circle', and a duality linking theorems concerning lines in Euclidean three-dimensional geometry to theorems concerning points in Euclidean space of four dimensions under replacement of 'line' with 'point'.

Hilbert, however, was more taken with a duality that had been observed to exist between geometry - specifically, the axioms of linear congruence in Euclidean geometry - and a wholly non-geometric subject - namely, the laws governing proportions of trait-couplings in mutations of certain varieties of fruit flies (Hilbert 1922/23: 84-6). This duality suggested to Hilbert the idea that certain non-logical 'forms' of thought might be so basic or useful to our thinking that they would belong to even its most widely disparate parts (intuitionally speaking). He therefore described it as 'more wonderful' than anything imagined in even the 'boldest fantasy' (Hilbert 1930: 380). Others, too (see Weyl 1927: 26-7, 1944: 635), were moved by dualities between remote subject matters.

The importance of the dualities for understanding Hilbert's formalist view is twofold. First, they suggest that in an axiom system, the mathematical terms do not function as constants but rather as variables of some sort. This in turn suggests that axiom systems are not to be seen as designed to capture a single, favoured interpretation that we think of as 'the truth'. Rather, they are to be seen as structuring a number of different subject matters. They are not designed to serve as theories of a particular subject matter but as 'theory-forms' - 'empty frames' (Pasch 1915:

11), ‘logical moulds’, ‘hypothetico-deductive frameworks’ (Weyl 1927: 25-6) - which provide a logical framework for the description of a variety of different subject matters (Hilbert 1899b: 40-1; see Detlefsen 1993 for more).

2 Axiomatization and the ideal method

The second respect in which the dualities of nineteenth-century projective geometry shed light on Hilbert’s formalism is in their reliance upon the use of so-called ‘ideal’ or ‘imaginary’ elements. These are elements that (need) have no intuitional or perceptual basis and whose sole justification is the simplifying or generalizing effects they have on our thinking about a given subject. Their use is well-illustrated by the duality between (1) and (1′) above. This depends upon the use of ‘points at infinity’ to serve as the points of incidence of pairs of parallel lines. (Without such ideal points, the duality between (1) and (1′) would have to be reduced to one in which ‘exactly’ were replaced by ‘at most’.)

Hilbert embraced the use of ideal elements in axiomatic theorizing. Indeed, he essentially identified the axiomatic method with the method of ideal elements (1926: 383). Specifically, he took the conditions for justified use of the ideal method to be the same as those for justified use of the axiomatic method; namely, that it be consistent with the underlying contentual practice to which it is applied and that it bring simplicity or efficiency to the production of mathematical knowledge (1926: 370, 372-3).

In Hilbert’s view, then, the justification of an axiomatic system depends upon more than its mere consistency. It depends as well upon its promotion of ‘epistemic efficiency’, which is what use of the method of ideal elements has to offer. The geometric dualities illustrate this point well; for every contentual proof, they yield not one but two theorems - one directly provided by the contentual proof, the other by application of the substitution scheme of the duality. One thus, roughly speaking, obtains two theorems for the ‘price’ (that is, the genuine proof) of one. The second, ‘free’ theorem will, of course, imply not only real propositions but also ideal or imaginary propositions (for example, the intersections of parallel lines at infinity). Not everything that it covers thus constitutes a gain in real knowledge. Nevertheless, a great part of what it covers does, and it produces this with superior ease or efficiency.

Hilbert described the axiomatic or ideal method as the expression of an important intellectual freedom - namely, the freedom to create and use imaginary elements. This freedom could be taken as far as one wanted to take it provided that it did not clash with an associated body of contentual practice and that it promoted simplicity or efficiency in the production of real knowledge (1900: 439-40, 1905: 135-6, 1926: 372, 379). Dedekind also spoke of the ‘freedom’ of the axiomatic method. However, he understood it in a sense importantly different from Hilbert’s - namely, as a freedom that contrasts axiomatic thinking not with contentual thinking, but with genetic thinking. Dedekind observed that genetically constructed objects (for example, the finite cardinals constructed as set-theoretic objects) inevitably take on features (for example, the infinity of the individual cardinals thus constructed) that are not relevant to their mathematical functioning. In Dedekind’s view, the axiomatic method provides an alternative by giving us the freedom simply to declare that a set of items has exactly the properties laid down for them in a given set of axioms. Items introduced in this way are ‘free creation(s) of the human intellect’ (1888: §73) which retain only the relevant features of their genetically constructed counterparts.

Axiomatic freedom according to Hilbert, on the other hand, was the freedom to introduce admittedly non-real, imaginary entities into our thinking when doing so increases efficiency (over against purely contentual reasoning) in the production of contentual knowledge (1926: 370-73, 379, 392). He thus assigned ideal elements a role similar to that which Kant assigned the so-called ‘ideas of reason’ in his critical philosophy. Kant saw ideas of reason as non-descriptive, regulative, conservative devices for the efficient development of the judgments of the understanding (*Critique of Pure Reason*, B85-6, 362, 385, 536-7, 825-7). We are free to use them so long as we do not confuse them with objective, descriptive laws applying to an external reality (which confusion leads to inconsistency). Hilbert saw ideal elements as a psychologically efficient (perhaps even indispensable) means of developing our real or contentual knowledge: we are free to use them so long as doing so does not lead to inconsistencies with contentual thinking (1905: 135-6; 1926: 383, 392; 1928: 471).

3 The formalism of the arithmetical period

This basic conception of the ideal or axiomatic method was a key ingredient of Hilbert’s thinking in both the

foundations of geometry and the foundations of arithmetic.

Hilbert's work in the foundations of arithmetic - his so-called 'programme' - was, indeed, nothing other than a defence of a particular application of the ideal method. What distinguished it from his work in the foundations of geometry was that the ideal elements used had a peculiarly 'logical' character, and that the consistency demand for use of these ideal elements could not be satisfied by reducing it to that of some more basic application of the ideal method.

The ideal elements that Hilbert proposed to defend in arithmetic were not imaginary mathematical items (for example, points at infinity, ideal numbers and the like) but imaginary *logical* items - what he referred to as 'ideal propositions'. These are not genuine propositions. They have neither meaning nor truth-value in the ('absolute') sense in which contentual propositions do. They are, rather, imaginary constructions (*Ideenbildungen*) that function only as symbolic or 'algebraic' devices for securing a desirable logic - namely, classical logic - for arithmetical reasoning. (See Hilbert 1922: 164-5; 1923: 179-80; 1926: 379-81; 1928: 467, 469-71; Hilbert and Bernays 1934: §1; see Hallett 1990 for a different interpretation.)

Examples that Hilbert gave of ideal propositions included, on the one hand, denials of true contentual generalizations (for example, '$\neg\forall x(x+1=1+x)$'), and, on the other, unbounded existential generalizations (for example, '$\exists x(\mathrm{Prime}(x)\ \&\ x>p)$', where *p* is some selected natural number) which follow classically from bounded, contentual existential generalizations (for example, '$\exists x(\mathrm{Prime(x)}\ \&\ x>p\ \&\ x<p!)$'). The former are 'ideal' because they do not bound the search for a counter-example to the generalization denied; the latter because they do not bound the search for a witness of the type they assert to exist. However, both help to preserve classical logic as the logic of arithmetical thinking; the first by protecting the law of the excluded middle for true contentual generalizations, the second by protecting the classically valid inference-form from '$\exists x(\phi x\ \&\ \psi x)$' to '$\exists x(\phi x)$', where the former is a contentual truth.

Hilbert's claim is neither that there is no logic of finitary or contentual reasoning nor that, though there is, we cannot know it. Rather, it is that even if such a logic were to be given, we would not want and, perhaps, psychologically speaking, would not be able to use it. For even if given, it would diverge from that logic according to which we most naturally and efficiently reason towards truth in contentual arithmetic (1926: 379-80, 1928: 470-2).

Hilbert thus introduced ideal propositions as purely formal or algebraic instruments for preserving (on a formal level) the desirable patterns of classical logical inference. But this purely formal conception of the ideal propositions induced a similarly formal character for arithmetic as a whole (1926: 376-83, 1928: 467-70; Hilbert and Bernays 1934: §1) - the logical terms as well as the arithmetical terms. The logical terms occur in purely formal devices (namely, ideal propositions) and must therefore themselves be treated from a purely formal point of view. Hilbert's formal conception of ideal propositions thus drove his formalization of arithmetic beyond where his formalization of geometry had gone - namely, to the inclusion of logical as well as non-logical terms (see Detlefsen 1993).

4 The consistency of arithmetic

As we will now see, this radical formalization of ideal arithmetic is what motivated Hilbert's belief in the possibility of a direct or finitary proof of its consistency.

Reasoning from the radical formalization of ideal arithmetic, Hilbert offered a purely syntactic formulation of its consistency problem; namely, to show the nonexistence of a formal proof whose endformula is '$0\neq 0$', or some similarly contentually refutable formula. In like spirit, he believed that there ought to be a purely finitary, contentual resolution of this problem. The problem is to search for a certain type of 'formal object'. The negative resolution of such a problem would, it would seem, lie as much within the province of finitary reasoning as, say, the task of proving the non-existence of two numerals *a* and *b* satisfying the equation '$a^2=2b^2$', a task which is finitarily manageable (1926: 383, 1928: 471).

Hilbert therefore undertook to give such a proof. It would, he believed, fill the final gap in the foundational enterprise by founding elementary ideal arithmetic. It would do so because it would be founded upon the 'absolute' truths of finitary judgment - judgments which neither need nor admit of any more basic justification

(1926: 376-7, 1922: 163; Hilbert and Bernays 1934: 20-1), and because the consistency of the other theories of ideal mathematics (most particularly those in analysis and geometry) can be reduced to that of ideal arithmetic (together with some basic set-theoretic apparatus).

This 'programme' of Hilbert's came under heavy attack in 1930-1 with the discovery of Gödel's incompleteness theorems. The second of these (G2), in particular, was important in this connection (see Gödel's theorems §6; Proof theory §2). It showed, for any formal axiomatic system *T* containing a fragment of arithmetic, how to construct a sentence Con_T of the language of *T* which seemingly 'expresses' the claim that *T* is consistent. It then went on to show that Con_T cannot be proved in *T* so long as *T* is consistent. If, therefore, *T* is rich enough to express all finitary proofs, it would follow that Con_T cannot be proved finitarily. From this it has generally been inferred that a finitary consistency proof is not possible for virtually any interesting portion of classical mathematics. Hilbert's programme therefore fails.

Whether such reasoning is correct depends, of course, upon whether Con_T really does 'express' the consistency of *T* in the appropriate sense. This, therefore, is one issue that must be resolved before the argument against Hilbert's programme from G2 can be conclusively evaluated. However, even if it is granted that Con_T does express the consistency of *T*, a further serious question arises: namely, whether the properties of Con_T that make for its unprovability in *T* (for example, the so-called derivability conditions of Hilbert-Bernays-Löb, or the RE condition of Feferman - see Gödel's theorems §5) are also properties that are indispensable to its ability to 'express' the consistency of *T*. Only if they are can the unprovability in *T* of Con_T be taken as showing the finitary unprovability of *T*'s consistency.

This deep and difficult problem has received little attention in the literature on Gödel's theorems and Hilbert's programme. But there are exceptions - see Detlefsen (1986: ch. 4) for a critical discussion of them. Detlefsen (1986, 1990) discusses what an adequate solution to the problem would look like and establishes the main features of two different types of negative solutions to it. Auerbach (1992) continues this discussion. In the end, the problem leads to fundamental questions concerning the nature of formal systems and to the perhaps even more fundamental question of what should be regarded as the basic unit of epistemic commitment in mathematics (see Detlefsen 1990 for further discussion).

Gödel's first incompleteness theorem (G1) has also been used against Hilbert's programme (see Kreisel 1976; Smorynski 1977, 1985, 1988; Prawitz 1981; Simpson 1988). The usual argument here begins with the basic premise that ideal arithmetic should be required to be a conservative extension of finitary or real arithmetic. G1 is then used to argue that this requirement cannot be met. The reasoning proceeds as follows: G_T (the undecidable sentence for a given ideal system of arithmetic *T*) can be proved by ideal but not by finitary methods; the ideal system in which G_T is provable is therefore not a conservative extension of finitary arithmetic; hence, by the basic premise of the argument, Hilbert's programme cannot be carried out. Detlefsen (1990) critically examines this argument, questioning, in particular, whether Hilbert's programme is rightly seen as requiring that ideal arithmetic be a conservative extension of real arithmetic. See also Webb (1980) for an argument that G1 actually confirms a formalist position like Hilbert's.

The Gödelian challenge to Hilbert's programme has also called forth other types of responses (see Proof theory §§3-4) - responses that concede the legitimacy of the arguments from G1 and G2, but which maintain that Hilbert's programme can none the less survive in a suitably modified form. For the most part, these arguments have taken one of two basic forms. In the first, the key element is weakening the evidential standards for consistency proofs to something less restrictive than Hilbert's original finitary demand. Some in this group (for example, Gentzen, Ackermann and Gödel) have argued that there are types of evidence having the same basic epistemic virtues as finitary evidence that extend well beyond the (traditionally identified) boundaries of finitary reasoning. Others (see Kreisel 1958; Feferman 1988; Sieg 1988) have argued not so much for a reconsideration of what should count as admissible evidence in a consistency proof as for a liberalization of our concept of what a consistency proof should do. They argue that the basic obligation of a consistency proof is to bring about some epistemic gain, and that there are epistemically gainful means of proving the consistency of ideal arithmetic that are not finitary. They therefore urge the replacement of the finitary/non-finitary distinction by a more refined hierarchical scheme that distinguishes grades of constructivity. Doing so, they believe, allows a significant partial realization of Hilbert's programme (see Proof theory §§2-4).

The other main type of response to Gödel's challenge is that represented by the so-called 'reverse mathematics' school of Friedman, Simpson and others. Instead of arguing for an extension of the types of reasoning to be allowed in consistency proofs, it aims at reducing the strength of the systems of ideal reasoning whose consistency needs proving. It begins by identifying more exactly those parts of traditional ideal mathematics that are truly indispensable to the distinctive achievements of classical mathematics. It then seeks axiomatizations that are 'equivalent to' these core parts and that therefore eliminate the extraneous elements of the usual axiomatizations. The idea is that the consistency of these diminished bodies of ideal reasoning might be susceptible to proof of a type to which that of their stronger standard counterparts is not. So far, significant success has been achieved along these lines (see Simpson 1988; Proof theory §4).

Hildegard of Bingen (1098-1179)

Hildegard of Bingen saw herself as a prophet sent by God to awaken an age in which great troubles were besieging the Church and people no longer understood Scripture. She tried to alleviate the first problem by writing letters to secular and religious leaders and preaching against those she saw as the culprits, and to this end she undertook preaching tours throughout Germany, preaching in cathedrals, monasteries and synods. Her writings, primarily interpretations of her own visions, address the second problem by trying to cast a new light on Christian revelation through illustrating it with original vivid imagery and personifications of abstract concepts. Though her works are not, for the most part, clearly philosophical, Hildegard does show philosophical insight.

Hildegard of Bingen was born to a noble family in Bermersheim in Germany. At the age of eight, she entered a hermitage which soon became a full Benedictine convent (whose abbess she became in 1136). She seems to have had more than the average education given to a noble-born Benedictine nun; she received regular instruction in Latin from the vulgate Bible from the abbess, and was further taught by one of the monks. Nevertheless, Hildegard repeatedly describes herself as ignorant and unschooled. Perhaps she says this to give legitimacy to her own writings: if she was unschooled, then whence could her elaborate texts and interpretations of Scripture come, if not directly from God?

Her claim of divine origin for most of her writings was supported by Bernard of Clairvaux and Pope Eugenius III in 1146-7. Their support launched her public career as a prophetess, and her influence and reputation grew steadily throughout Germany and all of Europe. As a woman receiving visions from God, she advised, admonished and criticized political and religious leaders, and undertook at least three preaching tours through Germany (1160-3). This growing influence enabled her to found her own convent at Mount St Rupert, near Bingen, where she died in 1179.

Hildegard's three major works, *Scivias (Know the Ways)* (1141-51), *Liber vitae meritorum (Book of the Rewards of Life)* (1158-63) and *Liber divinorum operum (Book of Divine Works)* (1163-73) all consist of extremely detailed accounts of her visions followed by allegorical commentaries on them, as well as commentaries on relevant passages of Scripture. *Scivias* and the *Liber divinorum operum* are organized in the same general way: they follow the history of salvation from the creation of the universe and human beings, the fall of the devil, the devil's temptation of Adam and Eve, the fall from Eden, redemption first through the law, the prophets and the synagogue, and then through Christ, the church and the sacraments to the end of times. Although Hildegard organizes her visions around the chronology of the history of salvation, within her interpretation of any single vision her method is to explain every detail of the vision in the order in which it was first described, without regard for thematic organization. The *Liber vitae meritorum* is an examination of thirty-five vices contrasted with their corresponding virtues, stemming from visions of various monsters personifying the different vices. Hildegard also wrote scientific and medical texts, lives of saints, and the music and text for a number of liturgical songs collected under the title *Symphonia*. She believed that all music (vocal and instrumental) brings the human soul back to the original praise Adam raised to God in Eden and which was lost in the Fall.

Hildegard's work is best characterized as theology of an unphilosophical sort. She does not explain Christian doctrine discursively, but rather illustrates it with images and comparisons which she only very rarely explains. For instance, when she discusses virtues and vices she does not explain what they are, nor does she provide the defining characteristics of individual virtues or vices (see Virtues and vices). She also seems oblivious to contradictions; throughout her work, for example, she hesitates between the view that the human body is essentially and incurably evil and the soul necessarily good (forced to sin unwillingly by the body), and the view that the body can be made good (as the tabernacle of the soul) and the soul evil (responsible for sin). Hildegard sometimes does make philosophical distinctions (for example, between different faculties of the human soul: the intellect, the will, reason, passions), and sometimes too she asks distinctly philosophical questions. For instance, in *Scivias* she considers the problem that divine foreknowledge poses for human freedom, but her reply is a heated denunciation of the prideful who suspect God of injustice. However, in her answers to two letters inquiring about fine points of theology, Hildegard gives philosophical characterizations of eternity as timeless existence and of simplicity as indivisibility, and she distinguishes between God's simple eternal nature, and a human being's

understanding of God, which is composite and temporal (see Eternity; Simplicity, divine).

It often seems that Hildegard is fettered by her method of 'vision-commentaries', which leads to difficult and disorganized texts, contradictions and a general lack of clarity in her thought. It was her visions, however, which gave her an authority uncommon to medieval women, and without the visions as legitimizers of her thought, she may not have been able to write as freely and originally as she did. Paradoxically, Hildegard often claimed divine authority for her visions from the fact that she was a 'weak little woman', and that God chooses those who have the appearance of weakness as his prophets, in an age in which those who have the appearance of strength are corrupted. Thus her gender also helped her to establish her claim of divine inspiration.

List of works

Hildegard of Bingen (1098-1179) *Opera omnia*, ed. J.-P. Migne, *Sanctae Hildegardis Abbatissae Opera Omnia*, Patrologia Cursus Completus Series Latina, vol. 197, Paris, 1855; repr. Turnhout: Brepols, 1976.

Hildegard of Bingen (1141-51) *Scivias (Know the Ways)*, ed. A. Führkötter and A. Carlevaris, *Hildegardis Scivias*, Corpus Christianorum: continuatio mediaevalis 43 and 43a, Turnhout: Brepols, 1978; trans. Mother Columbia Hart and J. Bishop, *Scivias*, New York: Paulist Press, 1990.(Barbara Newman's introduction to this volume is an excellent introduction to important themes in Hildegard's thought, and more especially to the *Scivias*.)

Hildegard of Bingen (1158-63) *Liber vitae meritorum (Book of the Rewards of Life)*, ed. A. Carlevaris, *Liber vitae meritorum*, Corpus Christianorum, Continuatio Medievalis 90, Turnhout: Brepols, 1995; trans. B. Hozeski, *The Book of the Rewards of Life*, New York: Garland, 1994.(Although Hildegard's descriptions of each vice and its corresponding virtue do not include philosophical definitions, they include insightful diagnoses of the psychological conditions that lead to behaviour characteristic of the vices, and of the ways in which someone might justify such behaviour to oneself or to others.)

Hildegard of Bingen (1163-73) *Liber divinorum operum (Book of Divine Works)*, ed A. Derolez and P. Dronke, *Liber divinorum operum*, Corpus Christianorum, Continuatio Mediaevalis 92, Turnhout: Brepols, 1996; trans. (abridged) R. Cunningham, ed. M. Fox, *Book of Divine Works with Letters and Songs*, Santa Fe, NM: Bear & Company, 1987.(Throughout this work, Hildegard hesitates between a dualist view of sin (that is, it is the nature of the soul to be good while it is the nature of the body to be corrupt) and the more orthodox position which she holds, for example in the *Ordo virtutum*, that the soul is responsible both for good and evil. She also hesitates between a fideist view of human reason's ability to understand God, and a more rationalist account according to which God gave human beings reason in part so that they can come to understand him.)

Hildegard of Bingen (1098-1179) Letters, ed. L. Van Acker, *Hildegardis Bingensis Epistolarium*, Pars Prima, Corpus Christianorum, Continuatio Mediaevalis 91, Turnhout: Brepols, 1991; Pars Secunda, Corpus Christianorum, Continuatio Mediaevalis 91A, Turnhout: Brepols, 1993; trans. J. Baird and R. Ehrman, *The Letters of Hildegard of Bingen*, vol. 1, New York: Oxford University Press, 1994.(Some of the letters have clearer philosophical significance than do Hildegard's major works, as she is often asked to answer distinctly philosophical questions as well as pastoral and liturgical ones.)

The translation is from A. Führkötter's German, not the Latin text.)

Newman, B. (1987) *Sister of Wisdom, St. Hildegard's Theology of the Feminine*, Berkeley, CA: University of California Press.(A comprehensive study of feminine themes in Hildegard's work, from her scientific view of

women's physiology and sexuality to the identification of some aspects of God as feminine, ranging through traditional themes such as Eve's special role in the Fall of Adam and Mary's role in the redemption of humankind. There are many insightful observations, but the arguments are sometimes unclear, and many of the conclusions are unsupported.)

Hillel ben Samuel of Verona (*c*.1220-95)

Hillel played a crucial role in the response of the philosophers in the Jewish community to the attacks made upon them by their enemies. He stoutly defended Maimonides while at the same time opposing the allegorical interpretation of miracles. Far less radical than Maimonides or Averroes, he tended to follow the approach of Aquinas. He also translated many philosophical texts from Latin into Hebrew. He was influenced by scholastic ideas and especially by the anti-Averroistic controversy. His major work, Tagmule ha-Nefesh (The Rewards of the Soul), completed in Forlì in 1291, deals with the nature of the soul and the intellect and with the spiritual requital of the soul after death. The chief purpose of this work is 'to explain the existence of the soul, its essence and its rational faculty, which continues to exist externally after death'.

1 Life and works

Hillel was a physician, translator, philosopher and Talmudic scholar. He studied medicine at the University of Montpellier and lived for three years (1259-62) in Barcelona. There he would have studied natural sciences. He would have been a pupil of the famous Talmudist Jonah Gerondi, an anti-Maimonidean thinker. Hillel also spent time in Rome, where he became acquainted with Zerahiah ben Isaac Gracian of Barcelona and Isaac ben Mordekhai (Maestro Gaio). He is known to have been in Naples and then in Capua (until after 1270), where he practised medicine and studied philosophy with Abraham Abulafia. After 1287 he retreated to Forlì, occasionally visiting Bologna and Ferrara. Between 1287 and 1289 he defended Maimonides. He sent two letters to that purpose to Maestro Gaio, at that time physician of Pope Nicholas IV. The occasion was the arrival at Ferrara of Solomon ben Abraham of Montpellier (Solomon Petit), the chief instigator of the anti-Maimonidean movement and teacher of Jonah Gerondi. Hillel requested that Maestro Gaio use his influence over the Jewish community of Rome to organize a synod at Alexandria, to which the Jewish communities of Germany and France would be asked to send representatives to discuss whether the reading of Maimonides' works should or should not be permitted. The final decision would be entrusted to a court of Babylonian rabbis.

Between 1289 and 1291 a controversy occurred between Hillel and Zerahiah ben Isaac Gracian over the rationalistic interpretation of the Bible. Hillel supported the historical reality of the supernatural events described in Scripture, such as the encounter between Jacob and the angel and the speech of Balaam's ass, whereas Zerahiah, stressing the twofold sense of the Bible - literal for the masses and allegorical-philosophical for the learned - stated that the miracles had taken place in prophetic visions and hid a philosophical meaning.

2 *Tagmule ha-Nefesh*

Hillel's major work, *Tagmule ha-Nefesh (The Rewards of the Soul)*, is divided into two parts, preceded by an introduction. The first part, divided into seven sections, deals with the nature of the soul and the intellect; the second, divided into three sections, addresses the question of the reward and punishment of the soul after death, addressing and relying for support on quotations from the Bible, the Talmud and midrash. In the introduction, based on the beginning of Aristotle's *De Anima (On the Soul)*, Hillel states that he wishes to write a concise treatise on the soul, because it is 'the most beautiful possession that mankind has' and its happiness constitutes the ultimate purpose of man. By means of a compilation of writings by philosophers, Hillel intends to discuss the existence, nature and recompense of the soul, since it is the soul that defines the human being. He further aims to establish that retribution after death is not corporeal. According to Hillel, a literal interpretation of the Bible and the Talmud can lead to the erroneous conclusion that the retribution of the soul is corporeal, that the soul is a body and that the angels and God, the prime source of emanation, are also bodies.

In the first part (sections I-II) Hillel draws on Avicenna's *al-Nafs (The Soul)* and Dominicus Gundisalvi's *De Anima (On the Soul)*. He then presents *Sheloshah Ma'amarim 'al ha-Sekhel (Three Articles on the Intellect)*, his own Hebrew translation of *Tractatus de Animae Beatitudine (On the Beatitude of the Soul)*, attributed to Averroes. Hillel holds that the soul exists (I) and is not an accident but rather an incorporeal substance. The soul is the substantial form of the human being. Its relation to the body is like that of form to matter. Its 'descent' into union with the body and its 'ascent', in separating from the body are not motions (II). The soul is immutable; furthermore, when united with the body, it is not subject to motion. It is indivisible and is a form between the specific and material forms, united through divine grace to the matter of the human body in order to perfect it (III).

The soul emanates from God through the mediation of the separate Intelligences. It represents the fourth stage in the emanatory process, directly after the 'active intellect'. The latter, one of the ten separate Intelligences, illuminates the rational soul during the cognitive process and is the cause of the passing of the mind from potentiality to actuality (IV). Hillel follows Averroes in asserting that there is only one eternal universal soul, one in substance and number, from which emanate the souls of individuals, like the rays from the sun; the plurality is accidental, a result of the number of subjects that receive it (V) (see Ibn Rushd; Neoplatonism).

The anti-Averroistic controversy, which inflamed the University of Paris in 1270 and 1277, exerted an important influence on *Tagmule ha-Nefesh*, in which special attention is paid to the Averroistic thesis of the oneness of the potential intellect for the whole of mankind (VI) (see Averroism). In order to refute this thesis, the adoption of which would lead to a doctrine of collective immortality, Hillel adapts a denial of faith, he adapts the first chapter of Aquinas' *De Unitate Intellectus contra Averroistas (Article on the Unity of the Intellect against the Averroists)* (VII): the soul is the form of the body, as the intellect is the form of the soul. From this Hillel infers that the rational part of every individual soul persists eternally after it leaves the body. Hillel states that he has not described the soul's faculties, except for the rational one, because 'the treatment of the other, corporeal faculties, such as the nutritive, the augmentative and the generative' is the object of medical science.

In the second part, Hillel states that the soul's reward or punishment after parting from the body is spiritual. The soul derives from a spiritual source to which it returns. Being incorporeal, the soul, cannot be subject to a corporeal reward or punishment (I). God granted humanity the possibility of attaining eternal happiness by means of the three intellects. Hillel describes them in detail, in particular the acquired intellect, which gives the intelligibles to the soul and is intermediary between the potential intellect and the active intellect. The latter watches over the human being in order that he may attain happiness. The quantity of the influence of the active intellect, exerted upon the rational and imaginative powers of the soul, varies with the nature of the individual. In addition to his imaginative and rational faculties, man must also correctly guide his sensitive and appetitive faculties, because on them depend the virtues and vices and the observation and violation of the divine precepts. The individual who has perfected the intellectual and ethical virtues can reach during his life the level of the active intellect and thereby acquire the ability to change the natural course of events by performing miracles. Such a soul, after the separation from the body, reaches a greater perfection than it had before the union. It is able to enjoy the happiness conferred by knowledge. The soul that has sinned, however, descends to a lower level. Through the imaginative power, which, like the intellective power, is immortal, such a soul will then imagine its punishments, and through the intellective power it will rationally know that it will not be able to enjoy spiritual happiness, because of its separation from the divine intellectual light, in accordance with the Avicennian tradition. In closing, Hillel hermeneutically divides the tales of the Rabbis into six classes and states that those passages which refer to corporeal retribution should not be interpreted literally.

Hindu philosophy

Hindu philosophy is the longest surviving philosophical tradition in India. We can recognize several historical stages. The earliest, from around 700 BC, was the proto-philosophical period, when karma and liberation theories arose, and the proto-scientific ontological lists in the Upaniṣads were compiled. Next came the classical period, spanning the first millennium AD, in which there was constant philosophical exchange between different Hindu, Buddhist and Jaina schools. During this period, some schools, such as Sāōkhya, Yoga and Vaiśeṣika, fell into oblivion and others, such as Kashmir Saivism, emerged. Finally, after the classical period only two or three schools remained active. The political and economic disturbances caused by repeated Muslim invasions hampered intellectual growth. The schools that survived were the Logic school (Nyāya), especially New Logic (Navya-Nyāya), the grammarians and, above all, the Vedānta schools.

*The central concerns of the Hindu philosophers were metaphysics, epistemological issues, philosophy of language, and moral philosophy. The different schools can be distinguished by their different approaches to reality, but all considered the Vedas (the sacred scriptures) authoritative, and all believed that there is a permanent individual self (*ātman*). They shared with their opponents (Buddhists and Jainas) a belief in the need for liberation. They used similar epistemic tools and methods of argument.*

In contrast to their opponents, who were atheists, Hindu philosophers could be either theists or atheists. Actually we can observe an increased tendency towards theistic ideas near the end of the classical period, with the result that the strictly atheistic teachings, which were more philosophically rigorous and sound, fell into disuse. Hindu metaphysics saw ātman *as part of a larger reality (Brahman).*

Because these views of the world differed, they had to be proved and properly established. Accordingly, logical and epistemological tools were developed and fashioned according to the needs and beliefs of individual philosophers. Most agreed on two or three sources of knowledge: perception and inference, with verbal testimony as a possible third. In this quest for philosophical rigour, there was a need for precision of language, and there were important philosophical developments among the grammarians and the philosophers who explained the Vedas (the Mīmāṃsakas). A culmination of these linguistic efforts can be seen in the philosopher of language Bhartṛhari. One of his greatest accomplishments was the full articulation of the theory that a sentence as a whole is understood in a sudden act of comprehension.

It is customary to name six Hindu schools, of the more than a dozen that existed, thus lumping several into a single school. This is particularly the case with Vedānta. The six are listed in three pairs: Sāōkhya-Yoga; Vedānta-Mīmāṃsā; Nyāya-Vaiśeṣika. This does not take account of the grammarians or Kashmir Saivism.

In their quest for freedom from rebirth, all the Hindu schools operated within the same framework. Their ultimate goal was liberation. How much they were truly engaged in the quest for liberation apart from their philosophical preoccupations is not always clear, yet they never doubted its real possibility.

1 General presuppositions

Hindu schools of philosophy developed in close, lively dialogue with other philosophical trends and schools. As early as 400-300 BC, both Pāṇini and the author of *Manusmṛti* (a third century BC book of laws) identified two major intellectual trends, one involving belief in the sacred texts known as the Vedas, and one involving their rejection. Those who considered the Vedas as their authority later developed into what we know as the Hindu schools.

With a few exceptions, most of the religious and philosophical movements aimed at liberation, complete freedom from life and rebirth. From about the eighth century BC, belief in rebirth was found among most philosophical and religious leaders. At first, the mechanism of rebirth was thought to be prompted by bad actions. It was also believed that by good actions a person became good and by evil actions a person became evil. Since with time this must have come to be perceived as rather simplistic, the idea of rebirth became more complex. A person was reborn just by acts, regardless of whether those acts were good or evil. Liberation from rebirth could be achieved by an absence of desire; desire of any sort, whether a craving for food, say, or for a new thing, entangled a person in the worldly mechanism of repetition (see Karma and rebirth, Indian conceptions of).

The various thinkers and teachers were specifically concerned with effective ways of achieving liberation. This meant establishing the basic presuppositions of the theory, such as what it is that truly exists, how this could be proved, and how liberation was to be viewed, and, moreover, how to promulgate such beliefs. There were constant discussions, an ongoing search for better ways of arguing with opponents. The formal requirements for building an argument were much disputed; each school believed that only its tools for debate were necessary, and that any others were useless.

An axiom held by most followers of the Vedic tradition was that there is a self (*ātman*) which travels from life to life. The 'life' in question need not be human; it can also be that of an animal.

In the early philosophical sources, the Upaniṣads, there is little room for any sort of agency beyond individuals with selves. It is only later that we find the idea of God or gods actively creating the universe and directing individual persons towards liberation or towards realizing some sort of aspiration towards the divine. Sometimes both these aims were combined.

2 Metaphysics

The concept of *ātman* was crucial in many debates, because there were many who either had a different understanding of it or who claimed to need no such concept. Argument helped towards a more precise articulation of the term, although many Hindu thinkers held that knowledge of *ātman* is only a partial understanding of reality; the individual self is only a part of the larger scenario of the universe. The universe was thought to be an all-encompassing spiritual entity, of which *ātman* is a minute fragment. Experiencing this spiritually, through meditative practices, frees a person from the ordinary way of things: such a person is not reborn, and does not repeat the anguish, pain, disease, old age and death of ordinary mortals, but is instead forever free. This can be accomplished through one's own efforts, although often the guidance of a teacher, a guru, is needed. These efforts may need to be extended over several lifetimes in order to work off all the accumulated karmic impressions. Karmic impressions, which may result from physical activities, speech or mental acts, are what actually bind people to the revolving process of rebirth.

Gradually, notions of divine intervention in the process of liberation found their way into numerous teachings. It was a combination of one's own efforts plus divine grace which would grant final deliverance, which was now not only freedom from repeated cycles of lives, but also either an identification with the divine, or companionship with a god as a lover or eternal servant. Some Advaita philosophers postulated a single ultimate principle, whereas others argued for the existence of an ultimate cause of the universe, namely God. Yet the worship of a multitude of gods was still widely practised, as it is to this day (see God, Indian conceptions of).

Udayana (eleventh century), one of the most prominent thinkers of the School of Logic (Nyāya), constructed an elegant set of arguments for the existence of God. Put crudely, his claim is that this multifarious world must obviously be the effect of some cause, and that cause must be nothing other than God. On the other hand, not all thinkers felt a need to trace the world to one primary cause, even though most took it for granted that causal chains are of prime importance in interpreting the world. The nature of the causal relation was much debated. Some claimed that an effect somehow already exists in latent form in its cause, just as yoghurt is potentially already present in milk even before the milk turns sour. In the same way, this whole manifold world somehow pre-existed in an undifferentiated primeval watery mass, into which it will dissolve itself again at the end of its existence. There are repeated existences and dissolutions.

Other philosophers, such as Śaōkara (eighth century), interpreted the relation between cause and effect in a slightly different way. The difference between the two is only apparent, because in reality the universe is only superimposed onto an unchanging, everlasting, universal and undifferentiated principle, the Brahman of the Upaniṣadic thinkers. We superimpose things out of ignorance. A favourite analogy is that of a man walking along the road, half-blinded by the brilliant sunshine at noon. Suddenly he jumps across an elongated shape in the road, out of fear that he may step on a snake. A passer-by laughs and asks, 'Are you afraid of a dirty old piece of rope?' The person who jumped with fear was superimposing a snake onto the old rope. In the same way, we superimpose the whole universe onto Brahman. In reality, there are no causal relations at all. We talk of such concepts to facilitate debate, but they have no place on the ultimate level.

3 Epistemic concerns

Philosophers differed in their views about the number and characteristics of the various means of knowledge (*pramāṇas*). The most widely accepted *pramāṇa* was perception. Inference and verbal testimony (such as an utterance by a competent speaker or a statement from the Vedas) were also considered important. Some schools added analogy and other special kinds of inference (see Knowledge, Indian views of).

Because of their differing ontologies, schools also disagreed about the objects of knowledge. Nyāya held that these were self, body, sense organs, mind, rebirth, pain and freedom (*mokṣa*). Sāōkhya linked the objects of cognition to the sense organs: the eye has colour as its object, the ear has sound, the tongue taste, and so on; inference has as its objects things beyond sensory perception, such as consciousness, the undifferentiated material stuff of the universe, and causal relations.

'Perception' was usually confined to sensory or external perception. Some thinkers also recognized a sort of mental perception for mental states (such as joy or anguish). This was sometimes classed as belonging to a larger category of internal perception which also included yogic perception. Yogic and other types of perception in turn could be classed as 'extraordinary', as in the Nyāya system, especially its later form (Navya-Nyāya, 'New Logic'). Precise definitions of perception varied widely. Some thought it was direct awareness of colour; others argued that it was a cognition arising from the relation of an object with the senses, which is not verbal and not erroneous, but definite. An exchange of ideas arose over whether perception is a direct experience, that is, non-propositional, and whether one can postulate a propositional level of perception. Nyāya and the classical Sāōkhya of Īśvarakṛṣṇa claimed to understand perceptions of two levels: non-propositional (roughly what we call 'sense data') and propositional (naming and attaching concepts to the sense-data) (see Sense perception, Indian views of).

Inference (*anumāna*) was the next most important instrument of knowledge. In the classical period, three kinds of inference were usually enumerated. Their definitions betray a certain confusion between old and new ideas of inference. Inference is used as a source of knowledge in cases where objects cannot be apprehended directly. The basis of inference is the consistent relation between the reason and the thing-to-be-proved (*sādhya*). This requires that we perceive the reason. Here is an example of an argument:

There is fire on the mountain. (Thesis)
Because there is smoke (which I see with my naked eye). (Reason)
Like in the kitchen. (Positive example)
Unlike in the lake. (Negative example)
Therefore there is fire on the mountain. (Conclusion)

The consistent relation is not explicitly stated in the syllogism, although it is quite obvious: where there is smoke, there is fire (see Inference, Indian theories of).

Verbal testimony was thought to be another decisive source of knowledge of things beyond sensory apprehension. A competent testifier is a reliable person who has direct knowledge, wants to communicate it and is also capable of expressing it. It was argued that the revealed sacred literature could be classed as testimony. There was also some discussion about whether to subsume this source of knowledge under inference. Other suggested *pramāṇas* were analogy and presumption. An example of presumption is the following: it is observed that Devadatta is fat; nobody sees him overeating during the day; so (the presumption is that) he must eat all night. Indian philosophers also discussed an argument known as *tarka*, a kind of reasoning that we call *reductio ad absurdum*.

4 Philosophy of language

From the earliest times, there was a preoccupation with language in Indian culture. 'Language' here means Sanskrit. A concern with the power and limitations of language is already clear in the *Ṛg Veda*. Of the six theoretical branches of learning listed in the Vedas, four are closely related to language: grammar, etymology, lexicography and poetry. The level of accomplishment eventually attained in these is demonstrated in Pāṇini's descriptive grammar, the *Aṣṭādhyāyī*. Patañjali's commentary on this, the *Mahābhāṣya* (second century BC) can be thought of as a kind of a bridge between grammatical and philosophical concerns (see Patañjali).

The fifth-century philosopher Bhartṛhari stands out among those who studied language. In his *Vākyapadīya*, he

considers the faculty of speech to be an instinct or intuition. He compares it to animal instinct and does not believe that language is learned. Language, according to Bhartṛhari, accompanies cognition - there is no cognition without language. His understanding of language is rather metaphysical, as he equates language with Brahman.

Bhartṛhari is particularly associated with the theory of *sphoṭa*, although the notion had been formulated some centuries before him. According to this theory, a sentence is an integral unit. Analysing a sentence in terms of phonemes, morphemes or words is useful for learning purposes, but the whole sentence alone is meaningful. When those who know a language hear an utterance in that language, they hear a sentence, not single words or phonemes; only those who do not know the language will hear individual bits of sound. As for the relation between word and meaning, Bhartṛhari holds that it is permanent and natural, not based on convention.

Althought all schools of philosophy were concerned with language, perhaps the earliest was Mīmāṃsā. The followers of this school were concerned with the interpretation of the Vedas, and in particular with the problem of the relation between words and sentences. The Mīmāṃsakas argued that, for a word to be intelligible, each utterance of it has to be identical with an earlier utterance that is now remembered. By extrapolation, words must be eternal. In the same way, the meaning of words is eternal, as is the relation between word and meaning.

Pāṇini had seen the need for a capacity for mutual connection between the meanings of words, and the Mīmāṃsakas similarly developed a set of conditions for meaningful and correct sentences. They named the capacity for mutual connection between the meanings of words ‘mutual expectancy’. For example, ‘he rides an elephant’ fulfils the condition of mutual syntactic expectancy, but a string of words such as ‘elephant, house, riding’ does not. But according to this condition, the sentence ‘he rides a house’ is also a sentence. So another condition, ‘semantic compatibility’, was added. In a sentence like ‘he rides a house’, the semantic compatibility is absent. The Mīmāṃsakas also required that the condition of ‘contiguity’ be fulfilled: words must not be spoken at long intervals or be separated by other words. Another condition was ‘the intention of the speaker’, about which there were varying opinions.

Each of the main branches of the Mīmāṃsā school developed its own theory regarding the semantic relationship between words and sentences. The adherents of Prābhākara believed that the meaning of a sentence arises directly from its collection of words. Conversely, words convey meaning only in the context of a sentence. Each word in a sentence conveys both its isolated meaning and the syntactic meaning. On the other hand, Kumarila Bhāṭṭa and his followers believed that the meaning of a sentence arises indirectly. Each word gives its individual meaning, and this uses up its significative power; therefore the syntactic relation must be obtained by means of a secondary significative power. This view was also shared by the Advaita Vedāntins, who, in order to be able to express truths about the Absolute, could not always use words with their primary meaning, but had instead to use the secondary meaning.

Of course, the Advaitins were not the only ones who distinguished between the primary and secondary meanings of words. This practice was well known among other philosophers, grammarians, and especially literary critics. In his *Mahābhāṣya*, Patañjali distinguished primary and secondary meanings, while Bhartṛhari discussed transfer of meaning (*upacāra*) through such tropes as simile, metonymy, synecdoche and so on. By the ninth century, Ānandavardhana, in his exposition of literary criticism, was discussing the ‘suggestive power’ of words. He observed that a text does not yield its full meaning to every reader, since the ideal reader must be trained in the symbolism and conventions of a text, and familiar with the realities to which the text refers. Such a reader has an intuitive grasp of the text that untrained readers lack.

The school of Nyāya was at first primarily concerned with theories of the relation between a word and its meaning. The Naiyāyikas did not consider this relation to be natural, but saw it as just a matter of convention. This conventional relation is called ‘significative power’ (*śakti*). *Śakti* applies to primary meaning only; although secondary meaning is accepted, it is considered only in terms of its relation to the primary meaning and can apply only to single words, not to whole sentences.

The Naiyāyikas and the grammarians stayed active for many centuries, in the course of which their teachings were transformed. The Naiyāyikas especially developed new terminology and techniques of argument; this change was reflected in their adoption of a modified name, Navya-Nyāya (New Logic) (see Gadādhāra; Gaōgeśa; Language, Indian theories of).

5 Moral issues

Two important principles govern Indian moral philosophy: karma and *dharma*. The theory of karma was articulated early in Upaniṣadic times (which are usually placed from 700 BC onwards, but were possibly earlier). It concerns the causal relation between acts and their results, although neither was always understood in a uniform way. In general, the workings of karma were not interpreted as a fatalistic mechanism. With the exception of a few schools, most Indian thinkers came to conceive of karma in terms of a kind of naturalistic law of causation. The best-known philosopher of the Upaniṣads, Yājñavalkya, was the first one to teach karma, which soon became discernible in almost all intellectual developments, as well as being a governing principle in everyday ethics.

The principle of *dharma* is closely connected with karma. *Dharma* literally means 'to uphold what is correct', what we may call today 'morality'. The precise translation of the term depends on the context. For example, we can translate *dharma* as 'justice' in cases where something that was unlawfully taken away is to be regained. Thus, in the epic *Mahābhārata*, it is justice for the Pāṇḍavas to regain their kingdom, which was illegally taken from them by their cousins, the Kauravas. There is also *dharma* as 'individual duty', according to a person's social and economic status in society. This could be compared to a certain extent with the Kantian idea of duty (duty for duty's sake). Then there is general *dharma* which applies to society as a whole, a guide in moral and social issues.

An important ideal in Hindu moral philosophy, that of the stages of life, is described in the body of literature known as the Dharmaśāstras. This endorses the determination of social status by birth, and prescribes for each individual (at least, each male of the two highest classes, namely priests and royalty) the various stages to progress through in life. The prescribed sequence is as follows: first, the socially responsible person should study and abstain from sexual relations; next, he should marry, bring up offspring and accumulate material possessions; third, he should become a religious seeker, leaving behind the comforts of home, family and riches (although his wife may still provide some familiar comfort); finally, he should leave the companionship of his wife and roam alone as an ascetic until death. Two value systems, one socially engaged, the other with an ascetic tendency, appear to be combined here (see Duty and virtue, Indian conceptions of). Closely related are the four aims of human life (*puruṣārtha*): material wellbeing, pleasure and enjoyment, morality and social responsibility, and, the ultimate goal, liberation from repeated birth. Here, too, two value systems are combined: the first three aims guide the socially engaged, whereas the last is the aim of a person in the final stage of life.

6 Philosophical schools: Vedānta

When speaking of Indian philosophy, it has become a convention to count six schools in the Hindu tradition. This division is rather artificial, especially since it involves putting the schools together in three pairs: Sāōkhya-Yoga; Vedānta-Mīmāṃsā; Nyāya-Vaiśeṣika. In fact, by the fourteenth century we find sixteen philosophical schools discussed in Mādhava's *Sarvadarśanasaṃgraha (Survey of the Major Philosophical Systems)*. Among these are schools opposed to the Hindu ones, such as Buddhism, Jainism and materialism. Mādhava places the materialists at the beginning of his treatise and culminates it with the Vedānta school to which he himself belongs. Including the different schools of Vedānta, we can count about a dozen Hindu schools.

Vedānta still survives and is the most influential school of modern times, having great intellectual and political figures among its adherents. 'Vedānta' describes several schools and numerous thinkers, and means 'the appendage to the Vedas', referring in this way to the body of texts known as the Upaniṣads. The Upaniṣads have been a source of inspiration and dogma since their beginnings around 700 BC. Embedded in them are ideas that came to dominate Indian thought, namely karma, rebirth, and liberation from the ever-revolving cycle of rebirth. The means of liberation is to experience the identity of the individual self (*ātman*) with a larger cosmic entity (Brahman). Individual thinkers each had a different interpretation of these tenets, but all essentially agreed on the means of liberation. Curiously, the development of Vedānta did not take place until more than a millennium after the earlier Upaniṣads. The most influential thinker of whom we know today was Śaōkara.

Śaōkara, like other Vedāntins, built on an earlier tradition. The work to which they all responded was Badarāyaṇa's *Brahmasūtra* (or *Vedāntasūtra*) of around AD 50. It stimulated many interpretive commentaries, which gave occasion for new schools to arise. The most prominent interpretation of the *Brahmasūtra* is known as Advaita Vedānta. It focuses on Brahman, which is understood as identical with *ātman*. Out of ignorance, the material world is superimposed on the ultimately empty Brahman; this superimposition is sometimes described as

an illusory projection (*māyā*). The first prominent name in this tradition is Gauḍapāda, who taught Śaōkara's teacher.

Śaōkara was prolific in his philosophical output. He commented on all the major Upaniṣads and the *Bhagavad Gītā([Upaniṣad, or Secret Teaching] Recited by the Lord Krishna)*, and a number of other works are ascribed to him. His Advaitism can be characterized as a strict nondualism: there is nothing other than Brahman, either real or unreal, and the goal is to know this through a trance-like experience which grants liberation (*mokṣa*) from rebirth. Were it not for this experience of truth, which is the vision of identity between *ātman* and Brahman, we would always superimpose this colourful world on transparent Brahman. This superimposition is an act of mistaking an unreal object for a real one, just as we superimpose silver on a piece of a glittering shell or a snake on a rope (see §2). If we could lift the superimposed object away from the real one, underneath we would find something altogether different.

This doctrine is austere and diminishes the importance of a personal God. It failed to stimulate the imagination of many people, and with time there was a strong reaction to such an abstract portrayal of reality. The form of Vedānta that flourished subsequently tended to have a more theistic cast. The earliest work of theistic Vedānta was Bhāskara's interpretation of the *Brahmasūtra*, whereby the individual self is both different and not different from God (Brahman). This doctrine was called 'the teaching of difference with no difference' (Bhedābhedavāda).

The *Brahmasūtra* was often seen in the light of theology devoted to the god Viṣṇu. The eleventh-century philosopher Rāmānuja, commenting on the *Brahmasūtra* in his *Śrībhāṣya*, claims that everything is Brahman, yet acknowledges the reality of individual selves and the material world. This teaching is called 'qualified monism' (Viśiṣṭādvaitavāda) because Brahman is described as Knowledge and as being merciful, all-powerful and all-pervading. Everything that exists is contained in Brahman, understood as a personal God who should be approached with constant devotion. Other interpreters of the *Brahmasūtra* postulated devotion to God; to many of them, he was some form of Viṣṇu, which indicates that they too had a problem with absolute monism. Therefore they introduced a modified monism: Nimbārka, for instance, combined both dualism and nondualism (Dvaitādvaitavāda).

The extreme position of disavowing monism was taken in the thirteenth century by Madhva (not to be confused with Mādhava), who claimed that there is an absolute difference between Brahman and individual selves (Dvaitavāda). Another extreme position was expressed by Vallabhacārya in his teaching of pure nondualism (Śudhādvaitavāda). Still other thinkers with other interpretations, such as Caitanya (1486-1534) of the Bengal Vaiṣṇavism, did not leave a corpus of literature behind them (see Gauḍīya Vaiṣṇavism; Brahman; Monism, Indian).

7 Other philosophical schools

Sāōkhya and Vedānta are similar with respect to epistemology and some ontological issues. Sāōkhya was an old dualistic school reaching back to the ontologies of Upaniṣadic times. It postulated an irreducible duality of consciousness and material stuff. Originally, the material stuff existed in an undifferentiated form, until it was disturbed by an intangible prodding of consciousness. Once disturbed, it produced twenty-three parts of the universe, with the human individual's parts in preponderance. Altogether, with consciousness and the undifferentiated material stuff, there are twenty-five things that exist. The goal of Sāōkhya was to experience the basic duality in a trance-like state, to discriminate between 'spirit' and 'matter'. Perhaps this dualism reflected vacillation between idealistic/metaphysical tendencies and naturalistic/materialistic tendencies.

Another old school was Vaiśeṣika, which in some respects was close to Sāōkhya. Like Sāōkhya, it strove to list all the things that exist in reality, to name everything there is. Such a proto-scientific enumeration of categories marks the antiquity of these systems. The number of ontological categories according to the classical Vaiśeṣika of Praśastapāda is six. Other philosophers enumerated as many as ten, others only seven. Among these categories, such as substance, quality and activity, we find a category of relation, inherence. Inherence is a relation between things that do not exist in isolation. It holds between qualities and substances, and between particulars and universals; a quality inheres in its substratum, a substance, so that, with a red apple, the red colour is a quality of the substance apple. This red colour cannot exist on its own, but always has to inhere in something, whether an apple or a hibiscus flower. The Vaiśeṣikas are known as the Indian atomists. Motion inheres in the atoms, which,

in their varying compositions as whole objects, are the substratum of motion (see Ontology in Indian philosophy).

The Vaiśeṣika school is frequently lumped together with the Nyāya ('Logic') school. The reason for this might be that later Nyāya philosophers took it upon themselves to comment upon and revise the old atomistic school. The word *nyāya* is often used for a maxim or an example in an argument, which is perhaps why it was adopted for the Logic school; earlier, however, it was used to refer to the system of Mīmāṃsā, yet another school.

The Nyāya school also had a list of basic categories. Their sixteen categories are quite obviously the parts of a rigorous argument: for example, instruments of knowledge, objects of knowledge, doubt, purpose, example, and so on. Thus the list consists of epistemological or proto-epistemological tools. The main preoccupation among the Naiyāyikas was to build proper arguments. They used a five-member syllogism based on the constant relation between logical reason and thing-to-be proved (*sādhya*). This relation came later to be known as concomitance or pervasion (*vyāpti*). The Naiyāyikas also tried to safeguard against possible mishaps in argument by distinguishing three kinds of fallacy in reasoning.

The early Mīmāṃsakas were completely engaged in interpreting the scriptures, which conveyed injunctions for ritual actions such as sacrifices and ceremonies. These actions should be performed because the Vedas say so - the Vedas are authoritative. Other pursuits, such as acquiring knowledge of oneself or engaging in philosophical debates about God, serve no purpose. Furthermore, any philosophical pursuit may give rise to doubts, and the doubts may extend to the authority of the Vedas. It was centuries before Mīmāṃsā was freed from such dogmatism, by the philosophers Kumārila and Prabhākara (both seventh century). They maintained atheistic positions, and made fun of inconsistencies in arguments for the existence of God. Prabhākara put forward a theory of the self-verifying nature of simple (non-propositional) perceptual knowledge which was heavily criticized by philosophers of other schools.

Yoga was a practical discipline of physical postures, breathing techniques and meditation whose origin we are unable to trace to any precise time, place or event. It went hand-in-hand with the ascetic life, no matter what the value system or outlook of its practitioners. Yoga is classically grouped with Sāōkhya. There may be two reasons for this. First, both systems date back to the ancient encounter in Indian history between Aryan nomadic conquerors and a settled agricultural people (which lasted several centuries from 1500 BC onwards). There are speculations that Sāōkhya developed within the newcomers' tradition, whereas Yoga was practiced among the original inhabitants. Perhaps just as the worldviews of these groups grew together, so were the schools assimilated one to the other. The second reason may have been that Yoga needed a theoretical background to become a system. Sāōkhya is the oldest recognizable proto-philosophical bundle of ideas. But what Sāōkhya and Yoga share is not really significant in view of the fact that many other schools adopted Yoga techniques.

According to the *Yogasūtra*, the aim of Yoga is to be able to attain a state of deep concentration (*samādhi*) by stopping the activity of the mind. Yoga differs significantly from Sāōkhya in requiring the grace of God for liberation. Yoga can be seen as a practical discipline capable of being adapted by various theoretical systems, especially those whose adherents are supposed to undergo spiritual experiences to achieve liberation from pain, anguish, longing and rebirth.

Hippias (late 5th century BC)

The Greek Sophist Hippias of Elis is a familiar figure in Plato's dialogues. He served his city as ambassador, and he earned a great deal of money from his lectures. His unusually wide range of expertise included not only rhetoric but also history, literature, mnemonics, mathematics and natural philosophy.

As a contemporary of Socrates, Hippias of Elis appears (as a rather self-important character) in several dialogues of Plato. Because of his learning and eloquence, he served as ambassador for Elis, and he lectured with great success at Athens and elsewhere. His intellectual range was very wide. Plato depicts him as lecturing on Homer (*Hippias Minor* 363a-b) and on astronomy and natural philosophy (*Protagoras* 315c). He also composed poems in several genres, and is credited with an important discovery in geometry, the *quadratrix*, a curve for trisecting angles and squaring the circle. He was one of the earliest specialists in mnemonics, and is reputed to have been able to memorize fifty names at first hearing. His historical research included compiling a list of Olympic victors (an important basis for Greek chronology) and collecting information on genealogies, tribes, famous or legendary persons and the foundation of cities.

Hippias' energy and versatility must have been extraordinary. Plato makes fun of him for appearing once at Olympia dressed in his own handiwork from head to foot, including his home-made signet ring, ornamental belt and sandals. He offered to answer questions on any subject, and he seems to have a prepared speech ready for any occasion (*Protagoras* 347b; *Hippias Minor* 363a-d, 369c).

The most original work of Hippias was a book from which we have the opening sentence:

> Some of these things have perhaps been said by Orpheus, some by Musaeus briefly here and there, some by Hesiod and Homer and other poets, as well as by prose authors, both Greek and barbarian. I will compose a novel and manifold discourse by combining the most important and similar items from all these.
>
> (fr.6)

The book seems to have been an allegorical work in which doctrines from Presocratic philosophy were attributed to the early poets. Hippias is apparently the authority Plato and Aristotle are following when they find the doctrines of Thales and Heraclitus in verses from Homer, Hesiod and Orpheus. It is likely that he was Aristotle's primary source for information on Thales. Hippias thus appears as the first doxographer and hence as the remote precursor for ancient and modern historians of philosophy (see Doxography).

Plato's satirical presentation suggests that he found Hippias' vanity great and his learning superficial. Nevertheless, of all the Sophists Hippias was apparently the most universal in his intellectual activity, a fifth-century precedent for Aristotle.

Hippias is the title of two dialogues in the Platonic corpus, the shorter of which (*Hippias Minor*) is surely by Plato. The authenticity of the longer dialogue (*Hippias Major*) is contested.

Hippocratic medicine

The Hippocratic corpus is a disparate group of texts relating primarily to medical matters composed between c.*450 and* c.*250* BC *and dealing with physiology, therapy, surgery, clinical practice, gynaecology and obstetrics, among other topics. The treatises are (for the most part) notable for their sober naturalism in physiological theory, their rejection of supernatural explanations for disease, and their insistence on the importance of careful observation. Although embodying a variety of different physiological schemes, they are the origin of the enormously influential paradigm of humoral pathology. In antiquity, the authorship of the entire corpus was mistakenly ascribed to the semi-legendary doctor Hippocrates of Cos (*fl. c.*450* BC*).*

1 The Hippocratic corpus

The collection known as the Hippocatic corpus comprises some sixty or more texts, of greatly varying styles, subject matters, lengths and probable origins, written in terse and unattractive Greek. The earliest may date from the mid-fifth century BC; the latest are certainly third century BC. The corpus contains the first treatises in Western rational medicine; and the best of them display the fruits of meditation not only upon practical problems in therapy but also upon fundamental methodological questions in science.

It is unclear how many if any of the Hippocratic texts can be associated with Hippocrates himself. Some of the treatises are clearly working notes of practising doctors (*Epidemics*); others are attempts to supply theoretical frameworks within which such practical medicine may flourish (*Prognosis*). Some treat the nature and aetiology of specific diseases (*On the Sacred Disease*), others the impact of certain environmental features on general epidemiology (*Airs, Waters, Places*); others still are devoted more to practical therapeutics (*Regimen in Acute Diseases*). Some are surgical (*On Joints*), while others (notably the late text *On the Heart*) deal with anatomy; yet others are ethical in nature, notably the famous *Oath* (and *On Decorum*), while some (*On Breaths*, *On the Art*) were written to justify the practice of medicine against its detractors. Also important was the influential anti-theoretical account of medicine in *On Ancient Medicine*, as well as important groups of texts on general pathology, gynaecology and obstetrics.

2 Naturalism

Prominent among the texts is a commitment to sober clinical observation and an attempt to account for diseases on the basis of a naturalistic approach to physiology, epidemiology and therapeutics, eschewing accounts of disease as the results of divine visitation, on the model of Apollo’s plague at the beginning of the *Iliad*.

In the opening chapter of *On the Sacred Disease* (*c.*420 BC), which deals with epilepsy and related seizures, the author affirms roundly that, however terrifying and numinous its appearance, this ailment is no more nor less sacred than any other. He exposes the claims of the ’purifiers’ that it is divinely sent (and hence requires apotropaic ritual treatment) to a cogent and systematic critique. Their ’account’ is simply an attempt to conceal their own ignorance, their ’treatments’ ritual mumbo-jumbo; they take the credit if patients recover, while arming themselves with excuses when they do not. Their taboo prohibition on goat products suggests that people who associate more with goats (such as the Libyans) should be more prone to the disease (which they are not), and that the causes of the disease are implicitly non-supernatural. Moreover, anatomical investigation of afflicted creatures shows them to be suffering from a superfluity of plegm, which suggests that the disease is caused by phlegm (which is cold and moist) blocking crucial pathways in the brain.

This text, which is typical of the corpus, is remarkable for the acuity of its criticism of the opposing model, but equally for the cavalier manner in which its author erects his own preferred physiological model on the flimsiest of evidential bases. Equally optimistic extrapolations from inadequate evidence may be found in *Airs, Waters, Places*, whose author attributes the prevalence of particular types of ailment in certain locales to their aspect, the type of water available, and their prevailing atmosphere. The notion that such environmental influences play some role in epidemic and endemic diseases is no doubt sound and empirically based: the theory that seeks to integrate that evidence is not.

The physiological theories espoused by Hippocratic texts are various, but in general they seek to explain health and disease in terms of the interplay of basic internal elements. Thus *On Regimen* makes fire and water the primary

constituents of the human body, the various ratios between them being responsible for different individuals' differing physiology and psychology, with serious imbalances among them producing disease. By contrast, *On Breaths* makes air fundamental: internal air regulates the body, inspired air nourishes it, noxious air harms it.

On the Nature of Man, rejecting element theory as too remote from the actual facts of human physiology, outlines the theory of the 'four humours' inextricably associated with Hippocrates' name. The four basic physiological constituents are blood, phlegm, yellow bile and black bile, a preponderance of any of which yields one of the four basic character types (sanguine, phlegmatic, bilious, melancholic), and excesses of which cause disease. Cures are thus effected by redressing the balance (almost all of Hippocratic therapeutic theory is allopathic in form, 'opposites cure opposites' being a constantly recurring aphorism). The theory purports to rest upon solid empirical foundations: yet black bile is a theoretical construction, answering (despite its enviable conceptual longevity) to no actual bodily fluid.

In reaction against this type of theorizing, *On Ancient Medicine* takes issue with 'new-fangled hypotheses' as being empirically undeterminable and therapeutically pointless. Medicine consists of seeing what sorts of regimen produce what kinds of illness, and what functions best in their treatment. This text thus anticipates medical Empiricism (see Hellenistic medical epistemology).

Equally, the case histories of the *Epidemics* are apparently untheoretical: they record the onset and progress of diseases, merely noting causal relevant features, such as overwork, fatigue, overheating, over-indulgence in food, drink or sex, as well as location and regimen. But these are precisely the sorts of things that might be expected to disturb a delicate internal humoral balance, not factors to be associated with an infectious model of disease transmission (whom the patient had visited, and so on) which is utterly absent from the Hippocratic corpus (even though Thucydides, for example, was well aware that the great Athenian plague was contagious). The Hippocratics do occasionally point to cuts and wounds as being relevant to the development of certain diseases, although they have little idea how such septic mechanisms might operate. But the notion that pathogens might be directly transmitted from one person to another is implicitly rejected as being incompatible with the dominant model of health and disease as depending upon the state of internal equilibrium or otherwise.

Historicism

Historicism, defined as 'the affirmation that life and reality are history alone' by Benedetto Croce (1938: 65), is understood to mean various traditions of historiographical thinking which developed in the nineteenth century, predominantly in Germany. Historicism is an insistence on the historicity of all knowledge and cognition, and on the radical segregation of human from natural history. It is intended as a critique of the normative, allegedly anti-historical, epistemologies of Enlightenment thought, expressly that of Kant. The most significant theorists and historians commonly associated with historicism are Leopold von Ranke, Wilhelm Dilthey, J.G. Droysen, Friedrich Meinecke, Croce and R.G. Collingwood.

The main antecedents for the development of historicism are to be found in two key bodies of work. J.G. Herder's Outlines of a Philosophy of the History of Man (1784) argues against the construction of history as linear progress, stating rather that human history is composed of fundamentally incomparable national cultures or totalities. G.W.H. Hegel's The Philosophy of History (1826) insists on the historical situatedness of each individual consciousness as a particular moment within the total progression of all history towards a final goal. The shifting fusion of these ideas provides the foundation for both the strengths and the problems of historicism. Historicism follows both Herder, in attempting to do justice to objective history in its discontinuity and uniqueness, and Hegel, in attempting to determine general patterns of historical change. Indeed, historicism can perhaps be best termed a Hegelian philosophy of history without an all-encompassing notion of progress.

Rather than constituting a unified intellectual movement, historicism is best known for its elusiveness. Its multifarious quality can be inferred from the variety of critical positions taken up against it. Influential critiques of historicism have been written by Friedrich Nietzsche, Friedrich Rickert, Ernst Troeltsch, Walter Benjamin, Karl Löwith and Karl Popper. Critical engagement with historicism has focused on its alleged relativism, its alleged particularism, its alleged claims to totality, its alleged subjectivism and its alleged objectivism. More positive debates with historicism have significantly influenced the thought of Martin Heidegger, Edmund Husserl and Hans-Georg Gadamer.

1 Historicity and knowledge

For much of the nineteenth century historicism was broadly linked with the great historian, Ranke, whose formulated intention was to describe history 'as it actually happened'. In this, historicism moves close to simple empiricism. However, later readings of historicism have moved substantially away from this conception.

Karl Heussi has argued in one of the most significant critiques of historicism, *Die Krisis des Historismus (The Crisis of Historicism)* (1932), that it possesses four main characteristics: (1) it is historical writing without cognitive analysis; (2) it incorporates a sceptical belief that history cannot lead us to certain judgments; (3) it claims that scientific knowledge is only possible within its own boundaries; and (4) it attempts to reach philosophical and theological truths through an immanent study of history. In contrast, George G. Iggers (1969) has argued that historicism possesses three chief characteristics: (1) the tendency to view the nation-state as an end in itself; (2) a hostility to ethical normativity, that is, the imputation of value to all historical information; and (3) a hostility to conceptuality in historical analysis, that is, an emphasis on intuitive or non-rational means of understanding. Similar points have been made more positively by Friedrich Meinecke in his *Historicism* (1936), the most significant twentieth-century defence of historicism.

These observations, despite clear distinctions, concur in suggesting a definition of historicism as a radical shift away from Enlightenment understandings of history. All of these traits can be viewed as counterpoints to key assumptions of Enlightenment thought: primarily to the identification of personal and national interest with higher morality (natural law) and to the faith in universal norms, both ethical and cognitive (see Enlightenment, Continental).

The vitalist, interested approach which both Heussi and Iggers attribute to historicist thought also derives from a critique of the Enlightenment. It rests on the following assumptions: that humanity has no nature, only history: that is, that experience and cognition are conditioned solely by history; that laws determining human life are not naturally prescribed, but are the products of specific historical contexts; and that the truth-content of cognition is

dependent not on categorial logic, but upon its situatedness in, and constant attentiveness to, history. Implicit in this is the suggestion that the historian and the object of historical study are situated in the same totality of experience and shared history. Historicism thus replaces epistemology and normativity with a notion of a shared, historically shaped, experiential horizon, through which all knowledge must be processed. It has often been claimed, not without justification, that this conception lends itself readily to specifically national historiography, as the experiential totality of history can be easily narrowed to national history (Iggers 1969: 272).

These assumptions have been variously expressed. For example, J.G. Droysen (1858) argues that historian and historical personality both constitute totalities of experience, and that through their interaction the historian may reconstruct the totality of the historical personality through an understanding of surviving expressions and data. In this conception, the norms of historical analysis and value are derived from a process of immanent critique. The immanence of this process is underscored by the assumption of the shared human, expressly not natural, quality of history and historian.

The vitalist or essentialist undercurrent in this historiography is articulated as a hermeneutic procedure by Wilhelm Dilthey (§3) in *Introduction to the Human Sciences* (1883). Here the moment of historical perception is called *Erlebnis* (experience). In this process, the task of the historian is the actualization of the general quality of a particular history through experiential communication with it. For Dilthey, the boundless stream of life is objectified in all historical personalities and artefacts, and can be reactivated by, and for, the present experience and interest of the historian. Historicism thus treats its reflections as context-embedded insights, constantly to be reworked in a cultural synthesis for the historian. The vitalist subjectivism of this construct resurfaces in Georg Simmel's *Problems of the Philosophy of History* (1892) (see Simmel, G.) and, in the context of English thought, in R.G. Collingwood's *The Idea of History* (1946) (see Collingwood, R.G.). For Collingwood, history and narrative literature have near identity: 'Both the novel and the history are self-explanation, self-justifying, the product of an autonomous or self-authorizing activity; and in both cases this activity is the a priori imagination' (Collingwood 1946: 246). Collingwood's 'a priori imagination' or 're-enactment' echoes the historical thought of Croce, in which historiography and aesthetics are also linked: 'Every serious history, and every serious philosophy, ought to be a history and a philosophy "for the occasion", as Goethe said of genuine poetry, though the occasion of poetry is in the passions, that of history in the conduct of life and in morality' (Collingwood 1946: 36).

It is in this radical historicization of knowledge that historicism has achieved its most durable philosophical impact. In the post-historicist thought of Martin Heidegger and Hans-Georg Gadamer (§3), the analytical complexities of historicism are transposed into an ontology of historicity in which the earlier methods of *Verstehen* (understanding) and *Erlebnis* (experience) are assimilated into a universal hermeneutic process, structured around language.

2 Totality and particularity

Particularly in the English-speaking world, historicism is better known for various critiques of its methods than for its own character. However, it is notable that the major critiques of historicism address significantly conflicting ideas of what historicism may mean. Indeed, these critiques are often articulated from positions themselves associated with historicism.

Perhaps the most influential of all critiques of historicism, Nietzsche's *Untimely Meditations* (1876) (see Nietzsche, F.), attacks historicism as an unselective objectivizing reading of the past which is detrimental to the vital impulses of the present. Walter Benjamin, particularly in his 'Theses on the Philosophy of History' in *Illuminations* (1940), rejects historicism as mere reproduction of the oppressive forces of homogenous (capitalist) history. Both these readings clearly see in historicism an early form of historical empiricism. Both, however, launch their attack from within the vitalist tradition of historicist thought.

In *Die Probleme der Geschichtsphilosophie (The Problems of the Philosophy of History)* (1924), the Neo-Kantian Henrich Rickert condemns historicism as 'nihilism' for its supposed lack of ethical values and norms. Karl Löwith, in *Meaning in History* (1949), denounces historicism as a secular product of occidental eschatology. Both these critiques attack radically different notions of historicism. Both however - Rickert in his attempt to ground historical hermeneutics, Löwith in his opposition to redemptive history - are rooted in a territory which historicism, in various guises, has already claimed. Even the theologian Ernst Troeltsch (1922), who proposes a

reading of history underpinned by the supremacy of the evangelical church as a counterpoint to ethical relativism in historicism, remains caught within that which he seeks to undermine.

The most famous critique of historicism in twentieth-century philosophy, Karl Popper's *The Poverty of Historicism* (1957), attacks a construct of historicism overshadowed by the conception that German historical writing, from Hegel through Marx to the 1930s, is sworn to totality (and totalitarianism). Like Löwith, although for wholly different reasons, Popper links historicism with theological, 'utopianist' conceptions of history. In his critique, Popper asserts a theory of historical causality which concentrates on the deduction of specific historical results from specific conditions, and is not reliant on any claim to totalizing perspectives on historical trends or broad-ranging experiential tendencies. Rather, the theory attempts to reintegrate the methodologies of the human and natural sciences. This critique is in fact a reiteration of two different repudiations of historicism, both common in the nineteenth century, on account of its supposed totalizing intention and its supposed historical relativism. Popper's argument culminates in the following: 'I wish to defend the view, so often attacked as old-fashioned by historicists, that history is characterized by its interest in actual, singular, or specific events, rather than in laws or generalizations' (1957: 143).

While Popper's critique certainly proved influential in the English-speaking world, and undoubtedly addressed key general problems of historiography, it is difficult to view this position as a comprehensive investigation into the character of historicism. Popper's analysis has two key deficiencies: (1) it focuses on a tradition of totalizing thought to which much historicism is expressly opposed; (2) it is itself bound into a framework of individualizing empiricism which certain traditions of historicist thought have always sought to make their own. Paradoxically, Popper condemns in historicism precisely what Nietzsche suggests as an alternative to it (see Popper, K. §4).

This diversity both in the defence and critique of historicism can clearly be seen to derive from an aporia implicit in the term itself. The terrain covered by historicism in its protean changes not only evades definition, it encompasses the ground from which antidotes to historicism can be administered. However, it is helpful to understand this aporia as conditioned by the general development of historical thought in the nineteenth century. Indeed, the tensions and contradictions within both pro- and anti-historicist thought can be viewed as energies released by nineteenth-century critique of the Enlightenment. As historicism is articulated as a loose corrective both to the perceived neglect of Enlightenment thought for the non-rational life of the individual subject and to its schematic way of dealing with particular objectivity, it is hardly surprising that historicism should fluctuate between (or seek to reconcile) the extremes of the empiricist particularism and the totalizing subjectivism of early vitalism - both positions seek to guarantee a critical perspective on the Enlightenment. It is within the tensions of critical engagement with the Enlightenment that historicism can be best understood, if not synthetically defined.

History, Chinese theories of

The beginnings of Chinese historical writing can be seen in the works of several early thinkers of the sixth through third centuries BC. *The various features which we see in their nascent form in early classical sources were developed, synthesized and found their first mature expression in the composition of what came to be known as the Standard or Official Histories, notably the Spring and Autumn Annals, the Shiji (Records of the Historian) and the Hanshu (History of the Former Han Dynasty).*

Much has been made of the purported 'cyclical' nature of Chinese views of time and the implications this has had on everything from Chinese views of history to the development of science. It is alleged that there was no notion of historical progress among the Chinese, who purportedly held a fatalistic view of infinitely repeating cycles of alternating political order and chaos, beyond human control. However, Chinese thinkers have held a wide range of different views about the pattern and flow of history.

While the amount of historical writing in China is truly staggering, Chinese thinkers have paid relatively little attention to the systematic study of the methodology and nature of history. However, there have been notable exceptions in both critical and speculative history. Critical historians at different times modified and made further suggestions regarding the form and content of the Official Histories. They also criticized the methods by which material for the Official Histories was gathered and controlled, and offered a variety of opinions regarding other forms of historical writing. Chinese philosophers of history developed elegant and sophisticated theories of history which purport to reveal the significance and structure of historical processes.

The nineteenth century marks the beginning of modern Chinese views of history, when Chinese intellectuals were first deeply influenced by Western views on the nature of history and historical method. This was also a time when Chinese society was shaken to its foundations by Western colonialism. Chinese historians of this period responded with impressive syntheses of traditional and western views. Traditional notions - for example the idea that history must fulfil a moral purpose - were recast in terms of the emerging phenomenon of Chinese nationalism. At the same time, new ideas about how objective factors, such as economic forces, shape historical events and the global scale on which these events take shape were incorporated into novel Chinese conceptions of history. This process continued into the early twentieth century when Marxist views became most influential. Early Chinese Marxist theories of history reveal a remarkable mixture of the strange and the familiar. However, Stalinist ideology quickly came to dominate more subtle forms of Marxism. As a result, Chinese Marxist views of history soon became ossified and uninspired. Little new or interesting can be found after the early 1950s.

1 Views of history in the pre-Qin period

The Chinese have shown a remarkable reverence for their past and have expended tremendous effort to record and preserve their history. This intense interest in history may have arisen, at least in part, from the practice of ancestor worship. The early Chinese sought guidance from their ancestors by divining with shell and bone, and engraved their queries and the received responses upon these materials. K.C. Chang (1983: 90) suggests that these inscriptions may have been saved for future reference, thus contributing to the notion that a *record* of past events can serve as a *guide* to proper future action, a central idea in Chinese philosophy of history. E.G. Pulleyblank (Dawson 1964: 144) has noted that ancestor worship required the maintenance of detailed genealogies and that the need to announce important state decisions to royal ancestors may have led to the keeping of state chronicles, one of the earliest forms of history found in China. These chronicles were maintained by court officials called *shi* (scribes), the same character that came to mean 'historian' and 'history'.

These early 'historians' were renowned for unswerving dedication to their calling. Several are said to have died insisting, against the wishes of their lords, that events be fully and accurately set down. These early paragons also purportedly embraced the notion that the historian's ultimate goal is to ensure the just distribution of 'praise' and 'blame'. The deeds of worthy individuals must be preserved, assuring them a kind of immortality and affording uplifting examples to later generations. Despicable acts too must be recorded and their agents held up for perpetual contempt and as a warning to future generations. Chinese history was thus seen as an accurate record of the intentions and actions of human beings, primarily those prominent in the central government, which served as a witness to good and bad deeds and a guide to future generations. These ideas about the proper role of history

explain why biography played such a prominent role in Chinese historical writing, and why these biographies largely concern issues of character.

Confucius believed in a Golden Age brought into being by a series of world-ordering sages, from which subsequent ages had devolved and to which his own age needed to return (see Confucian philosophy, Chinese). He saw his personal mission as preserving and restoring the beliefs, practices and institutions of this past age (see *Analects* 9.5). He himself was merely the messenger, someone who ‘transmits but does not create’ (*Analects* 7.1). In these respects, he can be seen as a figure who epitomizes the ideal of the historian as custodian of a record of ethical guidance, handed down from sagely ancestors.

The Mohists, chief rivals of the Confucians, criticized the traditionalism of the former (see Mohist philosophy). In a chapter entitled ‘Against Confucians’, a Mohist points out that the Confucian teaching of ‘transmitting but not creating’ is self-contradictory, for the divine sages who *created* the culture the Confucians claim to preserve and revere did not themselves practice this ideal. However, the Mohists too appealed to their own version of an idealized past. While they recognized and advocated technological progress, they believed that the proper forms and institutions of society had been discovered by past sages, and these simply needed to be revived.

A third representative of this general belief in a lost Golden Age is the later Daoist thinker Laozi, purported author of the *Daodejing* (see Daodejing). In Chapter 38 of this work, Laozi describes the devolution of the *dao* (way) (see Dao). Human history is the story of the rise of ethical self-consciousness, with a corresponding and proportional loss of innocence and simplicity, resulting in chaos and strife. While the Daoist Golden Age is very different from that of either Confucians or Mohists, the goal - to return to it - is the same. However, unlike the latter, Laozi makes no appeal to written records. In the ideal state, people do not employ writing at all; they keep their accounts by use of ‘knotted cords’. For Laozi, the Way lies in certain pre-rational intuitions that cannot be captured in words. During the time of the Golden Age, people embraced *pu* (unadulterated simplicity), were *wuzhi* (without knowledge) and *wuwei* (without action), living spontaneous lives in accord with natural patterns and tendencies (see Daoist philosophy). The revival of such a state would seem to entail the end of ‘history’.

Another major thinker of this period is the Confucian Mencius, who presents an interesting collection of views regarding history. While he is a strong defender of the Confucian vision, unlike Confucius, he relies more on intuition than tradition and expresses scepticism regarding even revered historical sources: ‘It would be better not to have the *Book of Documents* than to completely trust in it’ (*Mengzi* 7B3). Mencius also seems to have believed in an alternating five-hundred-year cycle of order and chaos (*Mengzi* 2B13). However, it is not clear the degree to which he believed this was an immutable pattern or simply an account of the interval between traditional sage-kings.

A contemporary Daoist thinker, Zhuangzi, recognized that different times and circumstances employ and indeed require different actions and policies. Things ebb and flow in human history but lack any set pattern or structure. Zhuangzi concluded that there was no discernable pattern in history, devolutionary, cyclical or progressive. The one thing one could learn from history is that to insist on patterning oneself on the ways of past sages is a recipe for failure. Thus the records of even the most gifted sages are nothing but their ‘chaff and dregs’.

The next great Confucian of this period, Xunzi, strongly criticized Mencius for believing that human nature contains innate moral tendencies. Xunzi saw this belief as not only wrong but also a threat to the status of the traditional wisdom of the founding Confucian sages. Xunzi regarded the insights of these sages as discoveries that had been achieved through a long and difficult process of experimentation. The founding sages had discovered how to organize society just as potters had discovered how to produce exquisite pottery, through a process of trial and error. Xunzi thus strongly implies an early period in which the *dao* evolved through successive stages until it resulted in the Golden Age whose plan Confucius preserved.

One of Xunzi’s disciples, Han Feizi, ultimately broke with the Confucian tradition, a move which required, and perhaps was in part caused by, his rejection of the Confucian view of history. Han Feizi argued that human history was progressive, moving from more primitive to more advanced stages. He mocked the Confucian call to study the ‘ways of the ancients’ and used historical examples primarily to illustrate the folly of such an attempt (*Han Feizi* 49). Han Feizi did show a strong sympathy with the Daoist belief in a primitive past utopia, but rejected the idea that this state of affairs could be revived. The world had become nastier since then: people were now too numerous

and goods too scarce. All that remained were selfish human desires, which could only be controlled through a system of strict rewards and punishments (see Legalist philosophy, Chinese; Law and ritual in Chinese Philosophy). Hence, while technology and certain social institutions would need continually to evolve, the evolution of human beings had come to a halt after an initial fall from innocence.

2 The Official Histories

The *Spring and Autumn Annals*, along with its various commentaries, served as the earliest models for Chinese historical writing. The text itself is taken to be the court record of Confucius' native state, covering the years 722-481 BC. Confucius purportedly edited it in order to insure that 'praise' and 'blame' were properly assigned. This and another, later classic, the *Shujing (Book of Documents)*, existed in some form during the early period of Chinese philosophy (see §1). Traditional accounts describe the *Shujing* as a 'record of words' - in other words, official proclamations - in contrast to the *Spring and Autumn Annals* which was 'a record of deeds', that is, the actions of officials. The form and theory of the Official Histories was greatly influenced by these two texts and early views regarding them.

A major development with profound and enduring consequences for Chinese views of history and methods of historiography was the writing of the *Shiji (Records of the Historian)*. Its author, Sima Qian (145?-90? BC), completed the work begun by his father, Sima Tan. Both had held the office of *taishi* (grand scribe) but their project was a private, family enterprise. The *Shiji* was a world history, seeking to provide an account of all of Chinese history down to the time of its composition. It presents the past primarily in terms of the lives of important families and individuals, largely though not exclusively those involved directly in the government, relying upon vivid and lively descriptions of their actions and intentions. Its narrative style is designed to allow historical events to speak for themselves; however, the author clearly embraced the 'praise' and 'blame' model of historical writing and believed strongly in the didactic value of history.

The composition of the *Shiji* was followed by another family production when Ban Gu (AD 32-92) completed the *Hanshu (History of the Former Han Dynasty)*. Ban Gu laboured to complete a project begun by his father, and his sister, Ban Zhao, helped to complete the work after his own death. While its structure is largely based upon the *Shiji*, Ban Gu's work differed in being a history of a single dynasty. This affected not only the structure of the work but the view that history should be seen as a unified whole: history now was presented in terms of the rise and fall of a single dynasty. Another difference between this later work and the *Shiji* is that while both began as private family projects, Ban Gu's work was co-opted by the government and received official support and sanction in its later stages. Thus it was the first truly official history, creating a model which began a series of later works that continued until the end of the imperial period in 1911.

While the different official histories vary in detail, they share a remarkable number of general features. As mentioned above, with the exception of the *Shiji*, all concern a single dynastic period; taken together, they present history as a series or, in some conceptions, a repeating cycle of imperial reigns. All rely, almost exclusively, on literary sources to construct their account of the past and employ a cut-and-paste method to arrange these materials into a coherent narrative. Again with the exception of the *Shiji*, all the official histories are retrospective, written by people from succeeding dynasties. By the time of the Tang dynasty (618-906) institutions were in place whereby the reigning dynasty prepared material intended to serve as the primary source for their own future history. Also beginning with the Tang, with the single exception of the *Xin Wudai shi (New History of the Five Dynasties)* by Ouyang Xiu (1007-72), official histories were the product of a team of historians assigned by the government to complete the task.

It was not long before historical writings came to be seen as a distinct and important genre. In the fourfold classification that became standard in the third century, history is ranked immediately after the classics, coming before both philosophy and *belles lettres*. It might seem strange that history was ranked ahead of philosophy, since historical writing owed much of its esteem to its ethical value. However, history, being a record of actual conduct was generally regarded as superior to philosophy, which was by its very nature abstract and speculative. This view was widely held throughout the tradition and precedents for it can be found in texts as early as the the *Zhongyong* (see Zhongyong) and the *Shiji*.

3 Chinese views of historical pattern and flow

We have seen that early Chinese thinkers expressed a wide range of different views concerning the pattern and direction of history (see §1). Some saw history as a repeating cycle of periods of human flourishing and decline. Others believed that history had evolved in earlier periods but that in at least certain important respects - specifically in terms of social institutions and practices - it had reached a stage of completion. Yet other thinkers denied that there was any discernable pattern or rhythm to the flow of history. The most widely held view was that history was a process of devolution from a past Golden Age to present turbid times. The exact nature of the lost Golden Age and the causes of its decline varied widely among different thinkers, but those who advocated such views all advanced an accompanying appeal to revive past institutions and practices in order to return to the Golden Age. This idea was further developed during the succeeding Han dynasty and found clear expression in texts like the *Liji (Book of Rites)*, particularly in the chapter *Liyun (Evolution of the Rites)* (see Chinese Classics), and the *Huainanzi*, particularly Chapter 2 (see Huainanzi). It is important to note that while such views hoped for a revival of the Golden Age, they also clearly entailed the idea that one can fall out of such a state as well as regain it. In other words, these were not millennial movements that saw an end to history in some final, ideal utopia. Some Chinese thinkers did express views like this: for example, the popular Daoist uprisings of the Red Eyebrows in the first century AD and the Yellow Turbans in the second century AD and the Taiping movement of 1851-64 were all founded on such a belief. The modern thinker Kang Youwei (1858-1927) also espoused a similar view (see §5).

Those who believed in a past Golden Age, as well as those who tended to see this age only as a future possibility, often described history in terms of set phases either devolving from or evolving into an age of good order, prosperity and peace. In some cases, such phases were seen as repeating historical cycles. Mencius may have held a view like this and the Han Confucian Dong Zhongshu, possibly developing ideas of an earlier thinker named Zou Yan (*fl.* 4th century BC), described history as a repeating cycle of five elemental phases: wood, fire, earth, metal and water, each of which exerts the dominant influence in their respective age.

Under the influence of Buddhism, later Chinese thinkers developed elaborate cosmic histories (see Buddhist philosophy, Chinese). For example, Shao Yong presented a complex scheme which describes history in terms of the coming into being of the universe, the emergence of living things, the flourishing of human society, the eventual decline of society and human beings, the ultimate end of all life and the extinction of this world system. The process then begins anew. Zhu Xi espoused a similar though much less articulated view, believing that the universe arose out of and would eventually devolve back into a state of undifferentiated *qi*, out of which a new universe would gradually coalesce and take shape (see Qi).

4 Theories of history in traditional China

Liu Zhiji (661-721) composed the first treatise on the writing of history in China, the *Shitong (Survey on History)*. Liu embraced most traditional notions concerning the purpose of historical writing and the idea that history should be viewed in terms of separate dynastic units. However, he criticized the degree to which the bureaucratization of the process of producing the Official Histories had come to influence their accuracy and objectivity. He also offered specific recommendations regarding the form and content of the Official Histories, suggesting that some of the traditional *zhi* (monographs) be dropped and others added. For example, he argued that the monographs on astronomy be eliminated since they concerned a topic that was timeless and hence inappropriate for inclusion in a historical work. He also argued that a new monograph on cities be added, thus expanding the range of material that was to be considered in the official histories. His ideas regarding the incorporation of local material in the writing of the Official Histories and his view that a historian had to possess the specific virtues of insight, literary skill and learning in order to perform his task, influenced Zhang Xuecheng (see below).

While Liu's *Shitong* was a treatise on the theory of historiography, the *Zizhi tongjian (A Comprehensive Mirror for Aid in Government)* of Sima Guang (1019-86) was a world history in chronicle form, covering the period 403 BC-AD 959. In the process of composing this great work, Sima Guang developed and refined his own ideas on the nature and practice of historical writing. As the title of the work suggests, the *Zizhi tongjian* had a very traditional goal: to provide a collection of historical examples of good and bad government that could serve as a resource for contemporary rulers. Sima Guang drew upon a wide variety of different sources for this work, going well beyond those normally used in composing the Official Histories. He began with a vast collection of material organized by period, which he then whittled down in successive drafts. One of his most significant methodological

developments was his effort to verify the authenticity of his sources and the events they recorded. He carefully examined the texts he drew upon and subjected them to strict philological and textual analysis. He would not accept the validity of any purported event if it conflicted with objective facts - such as a firmly established date - or if it failed to cohere with reliable collateral evidence and the dictates of common sense. He developed and maintained the rigorous critical standards of a scientific historian.

The greatest Chinese philosopher of history is undoubtedly Zhang Xuecheng (1738-1801). He made significant contributions to historiography; for example, he wrote and promoted *fangzhi* (local gazetteers) as an important historical genre. However, as he said of himself, his greatest insights concerned not the method of history but its significance. Zhang is renowned for his claim that, 'the six classics are all history'. By this he meant several things, all related to his grand speculative theories concerning history.

Like Hegel, Zhang believed history went through distinct and necessary stages of development. The *dao* (way) came into being as a response to historical necessities. However, unlike Hegel, Zhang believed that the process of historical development - specifically the evolution of social institutions and practices - had reached its highest point in the distant past. The *dao* had attained full form in the Golden Age of the Duke of Zhou. At that point in time, society had become a perfect and harmonious whole in which what we now regard as the separate functions of officials and teachers were united; there were no individual disciplines or schools of learning and all writing was anonymous and *gong* (public), being in the service of some branch of government. Later history has meandered around this lost ideal, with successive ages dominated by an excess of 'philosophy', 'philology' or 'literature'.

Confucius is unique in having been born at the historical moment when the *dao* crested and began to decline. He realized that his historically determined mission was to preserve a record of this ideal society. Later ages wrongly regard the texts he preserved as 'records of the *dao*', but in fact they are simply the records of various official agencies of this ideal time. The *dao* itself cannot be seen or described, only its traces, like the tracks of an invisible passing wheel (see Daoist philosophy §2; Dao). The *dao* takes shape and is revealed in the playing out of historical processes and so the classics, like all texts, are 'history'.

People of later ages also fail to see that their historical situations differ from that of Confucius and mistakenly attempt to emulate him by writing books about the *dao* instead of doing whatever their own historical moment requires. Their true task lies in discerning which of the three errant tendencies is in ascendance in their own age and working to counteract it. In order to succeed at this task, one must be able to read events in the world properly. This requires one to be a certain *kind* of historian. In addition to the three virtues described by Liu Zhiji, one needs to have the *virtue* of a historian: a kind of faculty or sense that allows one to discern how historical events fit into the grand pattern of the *dao*. Zhang's philosophy of history raises history to preeminent status: it is the way - the only true way - to understand the dao.

5 Modern views of history

The story of modern Chinese views of history remains incomplete. However, its opening chapter was written by Kang Youwei (1858-1927). Kang was both a highly respected traditional scholar and one of the first Chinese intellectuals to have a firm grasp and appreciation of Western ideas regarding the nature of history and historical method. This combination led him to propose a revolutionary view of history and in particular, Confucius' role in it. In his *Datongshu (Book of Great Unity)*, Kang rejected the traditional notion of a past Golden Age and the idea that Confucius had merely 'transmitted' its *dao* to later ages. Drawing on and modifying earlier Chinese views of history, such as those found in the *Liyun (Evolution of the Rites)* chapter of the *Liji* (see §2) and the *Gongyang* commentary to the *Spring and Autumn Annals* (see Chinese Classics), and combining these with ideas taken from Buddhism, Christianity and Confucianism, Kang developed a highly original speculative philosophy of history. His view is based upon his theory that the history of the world consists of 'three ages': the past age of Chaos, the present age of Approaching Harmony and future age of Great Harmony. Kang attempted to trace this idea back to early Chinese sources. However, while certain similar ideas can be found in early texts, particularly among the writings of Dong Zhongshu, Kang differed in seeing history as evolutionary and not cyclical. His theory of the three ages described a philosophy of historical progress culminating in a future grand utopia; the Golden Age lay not behind but ahead of us. Moreover, Kang claimed that this was Confucius' real view as well and argued that Confucius, aware of how revolutionary his message was, had cleverly presented his vision of the future as a form

of traditionalism.

Kang’s student Liang Qichao (1873-1929) eventually distanced himself from most of his teacher’s views of history. Liang turned to less speculative projects and wrote the *Zhongguo lishi yanjiu fa (Methodology for the Study of Chinese History)*. This work of practical, critical history attacked traditional Chinese historical method from a western perspective. However, in doing so it relied heavily on earlier Chinese critics of traditional methods, several of which have been discussed above.

Neither Kang nor Liang broke free from the traditional idea that history was to serve a higher moral purpose. Both were trying to relate their philosophies of history to the immediate and pressing concerns of contemporary Chinese nationalism. This led them and their successors to a broader examination of Chinese culture and a much greater appreciation of its variety and richness, particularly its more popular forms, which traditionally had been almost wholly neglected. This development had a profound effect on thinkers like Hu Shi (1891-1962) and Lu Xun (1881-1936) who advocated and contributed to the history and promulgation of popular literature.

The rise and eventual dominance of Chinese Marxism both contributed to and later constricted the development of modern Chinese views of history (see Marxism, Chinese). The Marxist explanation of history as the playing out of economic forces across vast spans of time, helped to introduce new ideas about the role of objective and enduring factors in human history. This broadened the scope and range of Chinese conceptions of history and worked to break down the dynastic view. It also encouraged a more synthetic approach to historical problems. However, cruder forms of Marxist historicism became dominant and the older dynastic view came to be replaced by an equally Procrustean scheme of ‘slave’ and ‘feudal’ periods. Debates then raged as to whether Confucius had lived during a ‘slave’ or ‘feudal’ period. A great deal was seen to turn on this issue: since Confucius defended the ‘feudal system’, if he lived in a slave period he should be viewed as a progressive, someone moving history forward on the ‘inevitable’ course toward its communist future. If however, it turned out that Confucius lived in a feudal period, then he should be viewed as a reactionary, someone holding back the future Golden Age.

In many respects, the Chinese Marxist view of history is both strange and familiar. Its moral temper and utopian nature are familiar features of traditional Chinese conceptions of history; and while its particular content is surely new, its general form and the trajectory it describes can be found in several of the sources and thinkers discussed above. The persistence of these traditional themes suggests that the story of modern Chinese views of history is still being written.

History, philosophy of

Philosophy of history is the application of philosophical conceptions and analysis to history in both senses, the study of the past and the past itself. Like most branches of philosophy its intellectual origins are cloudy, but they lie in a refinement of 'sacred' histories, especially those of Judaism and Christianity. The first major philosopher to outline a scheme of world history was Immanuel Kant in The Idea of a Universal History from a Cosmopolitan Point of View (1784), and German Idealism also produced Hegel's Lectures on the Philosophy of World History (1837), a much longer and more ambitious attempt to make philosophical sense of the history of the world as a whole. According to Hegel, history is rational, the working out, in fact, of philosophical understanding itself.

The accelerating success of natural science in the nineteenth century gave rise to a powerful combination of empiricism and logical positivism which produced a philosophical climate highly unfavourable to Hegelian philosophy of history. The belief became widespread among philosophers that Hegel, and Marx after him, had developed a priori theories that ignored historical contingency in favour of historical necessity, and which were empirically unfalsifiable. Karl Popper's philosophy of science was especially influential in converting philosophy of history to a new concern with the methods of historical study rather than with the shape of the past. Two rival conceptions of historical method existed. One tried to model explanation in history on what they took to be the form of explanation in science, and argued for the existence of 'covering laws' by which historians connect the events they seek to explain. The other argued for a distinctive form of explanation in history, whose object was the meaning of human action and whose structure was narrative rather than deductive.

Neither side in this debate was able to claim a convincing victory, with the result that philosophers gradually lost interest in history and began to concern themselves more generally with the nature of human action. This interest, combined with a revival of nineteenth-century German hermeneutics, the study of texts in their social and cultural milieu, in turn revived interest among analytical philosophers in the writings of Hegel and Nietzsche. The impact of continental influences in philosophy, art criticism and social theory was considerable, and reintroduced a historical dimension that had been largely absent from twentieth-century analytical philosophy. In particular, the formation of fundamental philosophical ideas began to be studied as a historical process. The Enlightenment came to be seen as a crucial period in the development of philosophy, and of modernity more generally, and with this understanding came the belief that the contemporary Western world is postmodern. In this way, social theory and the philosophy of culture in fact returned, albeit unawares, to the 'grand narrative' tradition in philosophy of history.

1 Origins

> Is there a logic of history? Is there, beyond all the causal and incalculable elements of the separate events, something that we may call a metaphysical structure of historic humanity, something that is essentially independent of the outward forms - social, spiritual and political - which we see so clearly?… Does world-history present to the seeing eye certain grand traits, again and again, with sufficient constancy to justify certain conclusions?
>
> (Spengler 1918, vol. 1: 3)

So writes Oswald Spengler at the start of his monumental book *The Decline of the West* (1918). Spengler thought that the sort of interest in history which he proposed to take was novel, and to be contrasted with an interest in the 'elements of separate events'. This implies that hitherto (that is before Spengler) all history was concerned with the mere recording of what actually happened, in fact the desire to have a knowledge of the past entirely for its own sake and without practical or theoretical aims, is a relatively sophisticated, and relatively late, intellectual accomplishment. Most historical writing is characterized by a less detached view. Arguably all cultures which lend importance to an awareness of their own past have tried to ascertain within it some meaning, significance or purpose, to cast light upon present events and speculate successfully upon the future. Generally, interest in the past of this practical sort has prevailed over the more academic concern of the study of what has been called 'scientific history'. Scientific history here means the attempt simply to arrive at an accurate account of past events based upon sufficient evidence, without regard to learning lessons or predicting the future course of events. To say that a 'practical' interest in the past has overshadowed a more academic one is not to deny that traces of scientific

history can be found in the ancient world; there is reason to regard Herodotus as one of its earliest and in some ways finest practitioners, and it was this sort of detachment from ultimate meaning that led St Augustine (§15) to regard the 'pagan' history of his own time as seriously inadequate. But more strikingly, and even earlier in Western culture, we find a broader intellectual ambition that can be described as the attempt to look beneath the surface of events and find their inner or ultimate meaning.

The most familiar histories of this kind have been religious. A marked feature of Judaism, for instance, is a belief in the revelatory power of the past to disclose, and to confirm, a relationship between a people and their god. The Jewish religion, as its sacred books reveal, is coloured by the desire to formulate a sacred history. Many of the books of the Old Testament try to move behind such historical events as the Exodus from Egypt or the removal of the Jews to Babylon and detect in them the purposes of God. In Isaiah, for example (which is generally agreed to be the work of at least two authors), the first prophet's principal interest is in explaining the conquests, invasions and natural disasters to which Judea was subjected at one point in its history as the actions of a God highly displeased by the moral and religious waywardness of his chosen people and unmoved by the ritualistic sacrifices they made it their practice to offer (see Hermeneutics, biblical §1).

Jewish theology is sacred history *par excellence*, but in this it is not unique. It has provided a model on which other religions have sought to improve. This is most obviously true of Christianity, which picks out a special set of events from the general flow of the past as the reference points around which a story of divine intentions may be told. This set of events includes many of those from Jewish history, but adds the central event of the Incarnation of God in Jesus, a historical figure of first-century Palestine, through whose life and teaching God can be seen to act directly in a historical time. Among the Church Fathers it is St Augustine who first makes Christian sacred history explicit; indeed we owe the term 'sacred history' to him. But much of the general idea is present in early Christian writings. These make extensive use of historical typology - of patriarch, prophet and messiah, for example.

2 Philosophical history

The idea of a 'sacred history' has its origins in these two religions, and their prominence in Western culture has made its conceptions highly influential in the subsequent development of historical and cultural self-understanding. However, histories of this rather grand sort need not always be concerned with the purposes of God, or even with the invocation of supernatural agencies. Subsequent, secular, thinkers have taken up the same ambition, but transformed it in essentially non-religious ways. The intellectual Enlightenment in the eighteenth century was a considerable stimulus to this. Among the writers who began this process the most notable were J.G. Herder (§4), author of *Outlines of a Philosophy of the History of Man* (1800), and the Marquis de Condorcet, who wrote a *Sketch for an Historical Picture of the Progress of the Human Mind* (1795). Immanuel Kant was the first major philosopher to formulate explicitly *'The Idea of a Universal History from a Cosmopolitan Point of View'* (1784). In this essay Kant maintains that though the empirical study of historical phenomena is essential to understanding the human past, in itself it is insufficient, since the plans of individuals, however rational, cannot on their own explain the emergence of developing forms of thought and civil association. There are, Kant contends, general trends to be observed in the history of humankind. These cannot plausibly be attributed to the purposes of individuals, even in concert, and thus any serious intellectual concern with the past has to supply a different explanation. Their explanation, Kant believed, must impute to the historical process a natural teleology, a purpose or end which nature or providence (he uses both terms) develops through the rational agency of human beings.

Kant's essay is merely an outline of a possible form of inquiry, and in it he looks to the emergence of an equivalent in this sphere of a Kepler or a Newton in physical science, someone intellectually equipped to compose a genuinely universal history which will reveal the underlying rationale of the past in the way that Kepler and Newton uncovered the underlying rationality of the physical universe. Such a figure as Kant anticipates might be thought to have been found in his celebrated successor G.W.F. Hegel (§8), whose *Lectures on the Philosophy of World History* (1837) probably constitute the most sustained effort ever made in this aspect of philosophy. Though Hegel believed himself to be providing a rational exposition of the truths obscurely contained in Christianity, the outcome of his reflections on 'world history' was one in which theological categories were systematically replaced by philosophical conceptions. Thus the work of divine agency is in Hegel converted into the activity of 'reason' itself, and the end of history is not the kingdom of God but the manifestation of absolute mind or spirit.

There remain some mystical elements in Hegel's view, and he himself did not intend that the religious dimension

should be eliminated; it was, rather, to be rationalized by philosophy. But even if Hegel retains some of the essential characteristics of sacred history, during the course of the nineteenth century successor histories of the same 'grand' sort emerged which had no place for religious meaning or the divine. The best known of these is that of Karl Marx (§8). Set out in brief in the *Communist Manifesto* (1848), co-authored with Friedrich Engels, and elaborated at much greater length in the unfinished three-volume work *Capital* (vol. 1, 1867), Marx's theory of history self-consciously abandons religious aspirations as products of false-consciousness and seeks their replacement with purely material (largely economic) alternatives. Marx does not invoke divine intentions but rather historical laws governing economic change - from feudal to capitalist to socialist - and the communistic classless society to which he looks as the future ideal is not a world constituted and governed by universal acknowledgement of divine rule, but one waiting to be created by imaginative human endeavour freed from the constraints of economic necessity.

Marx is not alone with his secular alternative to sacred history. Better known in their own day were those of Auguste Comte and Herbert Spencer. For Comte, regarded by some as the founder of modern sociology, the categories of religious thought which traditional sacred histories employed, represented a primitive 'theological' stage of mind, that the philosophical rationalism of the seventeenth and eighteenth centuries had replaced and hence rendered redundant. This rationalism, which Comte referred to as the 'metaphysical' stage of human history, was in its turn being replaced by the scientific advances of the 'positivist' period in which he was writing. Spencer also saw contemporary science as containing the means of remedying the inadequacies of religious understanding, and set about deploying, as he saw them, the insights of evolutionary theory for the purposes of constructing a new world history.

The accounts of the past elaborated by Comte, or Spencer, have attracted little serious attention in this century, but, no less than Marx's more famous contention that 'all history is the history of class struggle', they exemplify an attempt that has often been made to formulate a grand narrative of human history without the assistance, or restrictions, of revealed religion. These attempts retain a continuity with those that they sought to replace. Between the older sacred histories and their newer secular rivals there are marked differences. Yet there remains in them the same aspiration of looking behind the surface appearances of history, and the same belief that we need not rest content with merely recounting sequences of events in chronological order, but may properly seek to discern a meaningful direction within them.

Alternatives to sacred history, such as those of Hegel, Marx and Comte, have been called 'grand narratives', and in them we find the origins of philosophy of history, to be contrasted with history *simpliciter*. These various and familiar conceptions all illustrate the nature of 'philosophical' as opposed to 'scientific' history. They contend that behind the miasma of historical chance and change, the past has a shape or a direction or a meaning. The task of discerning this shape has attracted various labels. Sacred history is one, grand narrative, world history, philosophical history and universal history are others. But whatever the variety of terms, it is here that philosophy of history proper begins.

3 Analytical philosophy of history

The foregoing is philosophy in rather a grand sense, the sense in which many people who do not know a great deal about philosophy expect it to be conducted. But from an early stage philosophers, especially in the analytical tradition, were sceptical of the ambitions of Hegel and his successors. In fact Hegelian philosophy of history, and with it the whole endeavour to produce a universal history, fell out of favour relatively quickly, and never attracted very widespread support in the English speaking world. There were several reasons for this, one of which was that Hegelian philosophy came to be associated with totalitarianism. A more deep-seated philosophical reason, however, had to do with the success of natural science and the philosophical dominance of the positivistic, empirical conceptions of knowledge to which this success gave rise. The positivist idea that our knowledge can only comprise plain, empirically ascertainable fact is, by its nature, unsympathetic to conceptions of hidden or underlying 'meanings' (see Positivism in the social sciences §1). This is as true of history as of other disciplines.

The most influential elaboration of these doubts for the philosophy of history is to be found in Karl Popper's celebrated book *The Open Society and its Enemies* (1945), in which he develops a line of thought similar to that found in earlier British critics of Hegel, notably L.T. Hobhouse and Bertrand Russell (see Popper, K. §4). In an earlier work Popper had developed a criterion of proper science, by which we should take him to mean real

knowledge. This is the falsifiablity criterion. A theory counts as a genuine contribution to knowledge if it can in principle be falsified by empirical observation, and has withstood attempts to falsify it. According to Popper, Hegel’s philosophy of history, like its less philosophical successor, Marxism, is vitiated by its manipulation of evidence to avoid falsification. Rather than the theory being answerable to the facts scientific history uncovers, the ‘facts’ are determined by the theory. Hegel and Marx do not tell us how the past was, but how, in the light of their theories, it must have been. In this way, though they masquerade as historians, they in fact pass beyond the realms of empirical history, and the claims they make, though they may superficially look like historical theories, are actually unfalsifiable a priori assertions. Thus, when Hegel considers the histories of India or China, which do not fit the general conception with which he is working, they are not taken as refutations, but explained away as aberrations.

In a later book, *The Poverty of Historicism* (1957), Popper applied this criticism to theories of history more broadly, and his attack on what he labelled ‘historicism’ has generally been regarded as both innovative and effective. Marx raises the very same criticism against Hegel, and Hegel himself is not only aware of it, but tries to answer it. Whatever the justice of the criticism, or the cogency of Hegel’s original reply, Popper’s charge stuck for some considerable time, and this caused the philosophy of history to take a different turn.

If the construction of grand narratives is no longer respectable, what interest can philosophy take in history? The answer is ‘methodology’. In this respect philosophy of history in the twentieth century followed the path of philosophy of science a century earlier. With the divorce between natural philosophy and empirical science, philosophers in the nineteenth century ceased to concern themselves directly with explaining the phenomena of the natural world, as philosophers of an earlier period had tried to do, and focused instead upon the methods by which empirical science did this. This is a large part of the purpose of John Stuart Mill’s *System of Logic* (1843), for instance, which has had great influence on philosophers of science, whose aim increasingly became that of making explicit the methods of science (see Mill, J.S.). In a similar fashion, philosophers tried to articulate the methods and presuppositions of empirical history.

Once the subject turned in this direction it was inevitable that comparisons would be drawn between science and history, and hence for a time the predominant ambition was to give history a status equivalent to that of science. Thus, for instance, against a background assumption that natural scientists are value-neutral with respect to their subject matter, it became a question as to whether historians could likewise achieve neutrality with respect to the events they recounted. The attempt to answer this question positively was allied by a movement among historians themselves to abandon ‘Whig’ interpretations of history, according to which the past was conceived as a struggle between the ‘good’ forces of enlightenment and the ‘bad’ forces of reaction.

The high point of philosophy of history modelled on philosophy of science was a famous essay by Carl Hempel, ‘The Function of General Laws in History’ (1942). Having earlier set out a logic of scientific explanation, showing it to require only empirical observation and logical validity, Hempel argued that the same pattern could be found in the investigations of historians, and that the explanation of historical events required general ‘covering laws’ no less than that of physical events. However, Hempel’s application of natural scientific models to history was convincing only so long as it was thought that he had really uncovered the logic of science. In fact, philosophers of science, including Hempel himself, found serious difficulties with the basic model, which, being a purely logical structure, had difficulty in accommodating temporal order and causal dependence. It could, for instance, as easily accommodate the idea that the length of a shadow explains the height of the sun, as that the height of the sun explains the length of a shadow.

4 History and the understanding of action

Despite several attempts like Hempel’s, the difficulty of establishing a convincing parallel between history and natural science raised more serious sceptical doubts: do historians actually explain events? Is an objective knowledge of the past possible at all? These questions drew philosophers of history into yet more general questions of epistemology and metaphysics. What is knowledge? What sort of existence does the past really have? In turn, this prompted an examination of alternative philosophies of knowledge and understanding and, at the hands of philosophers such as Isaiah Berlin, attention began to be paid to German thinkers of the nineteenth century, notably Herder and Dilthey (§3). It also drew attention to the earlier and hitherto neglected author of *The New Science*, the Italian philosopher Giambattista Vico (§6), whose principal intellectual endeavour had been to

capture the distinctiveness of cultural study.

This movement away from the scientific analogy was strengthened by those philosophers of history who had remained convinced that the attempt to model history on science was mistaken. One important thinker in this regard was R.G. Collingwood, an Oxford philosopher, also a distinguished historian in his own right, who had remained in the idealist tradition, largely unaffected by the major currents of the positivistic philosophy of his time. Collingwood's *The Idea of History* (1946) was not published until after his death, but it set out in an influential way both the history of history and a striking alternative account of historical understanding to that of the scientific model.

Collingwood argues, in common with many German philosophers of the nineteenth century, that there is a radical difference between natural processes and historical events. What distinguishes the latter from the former is that they have meaning. That is to say, natural processes, such as volcanoes or chemical reactions, have no significance for the objects or materials which undergo them. This leaves scientists who study them free to identify and order in accordance with their theoretical and explanatory purposes. But the actions of which history is composed are quite different. These have significance and meaning for the agents who performed them; their nature is determined by the cultural context and individual thought that gives rise to them. In the strict sense, natural processes can only be explained; there is nothing about them that requires understanding. By contrast, the events of history have to be understood, and Collingwood marked this difference by saying the historical events have an inner meaning as well as an outer form. The task of the historian, accordingly, is to rethink the thought of the historical agent.

Among philosophers in the analytical tradition, the writer who brought Collingwood's ideas to greatest prominence was W.H. Dray. In his book *Laws and Explanation in History* (1957), Dray directly confronted the Hempel-inspired conception of historical explanation, and argued for a more humanistic conception. In the same spirit, W.H. Walsh argued in favour of 'colligatory' explanations that brought to prominence the idea of historical explanation as narrative. For a time these alternatives fought a vigorous battle in a large number of books and articles. The argument was extended, in fact, into the philosophy of the social sciences, where the gulf between empirical, positivistic theories and hermeneutic, interpretative conceptions of the understanding of human behaviour widened (see Social science, methodology of §4).

However, no clear victory emerged on either side, and the dispute rather suddenly ground to a halt. Interest in Vico, Collingwood and hermeneutics all grew, but explicit interest in the philosophy of history itself declined.

5 The return of 'grand theory'

With the demise of its analytical version, philosophy of history appeared almost to disappear. But this was largely a matter of mere appearance. In other branches of philosophy the introduction of a historical element became increasingly important. In Richard Rorty's *Philosophy and the Mirror of Nature* (1980), for example, the thesis was advanced that the central problems of metaphysics and especially epistemology had to be understood, and resolved, in the context of a historically specific ambition (see Rorty, R.M.). And Alasdair MacIntyre's *After Virtue* (1981) applied the same sort of thinking to the problems of moral philosophy. According to MacIntyre, the philosophical difficulties encountered by attempts to render morality coherent were the outcome of a long historical process of cultural disintegration (see MacIntyre, A.). Charles Taylor, in *Sources of the Self* (1989), was another influential thinker who sought philosophical illumination from the history of ideas (see Taylor, C.).

Rorty, MacIntyre and Taylor, though closely concerned with the analysis and resolution of philosophical problems, all took an approach that set them in the broader context of the general sweep of the past. Their concern was with what had happened to the human mind in the course of developing its ideas. None, with the possible exception of Taylor, were self-consciously followers of Hegel, but the Hegelian character of their approach to philosophy and its past is unmistakable. This powerful movement in analytical philosophy thus found common ground with hitherto alien continental philosophy, which, having always been more historical in its orientation, had gradually focused around the idea that the collapse of Enlightenment rationalism was the key to the demise of the modern mind, or modernity, fashioned by two hundred years of theorizing, and to understanding a postmodern, relativistic world in which values, including even knowledge itself, were in constant flux. Among the most prominent continental theorists are Martin Heidegger, Michel Foucault, Emmanuel Levinas and Jacques Derrida.

These trends in philosophy have been highly influential in legal and social theory, literary criticism and

anthropology. They are not always self-consciously philosophical, however, and still less have they been seen as a revival of speculative philosophy of history. Yet this is what they are - the application of philosophical concepts and analysis to history, and especially cultural history, in the belief that an adequate understanding of contemporary thought requires the mutual illumination of the two. The difference from Hegel's philosophy of world history is in substance rather than style. Whereas Hegel believed that the world of ideas he inhabited was the culmination of rational processes, one in which the human mind had finally arrived at its own intelligibility, postmodernist thinkers, Rorty and MacIntyre no less than continental philosophers such as Foucault and Derrida, generally think of the modern mind as a fragmentary residue of past ideas, and incapable of sustaining the sort of rational intelligibility the Enlightenment aspired to. They are thus 'grand theorists' no less than Herder, Kant or Hegel, though whereas the latter were rationalists and progressivists, the ideas of the former are broadly relativist and pessimistic.

The question therefore arises as to whether these modern grand theories are susceptible once more to the sorts of criticism that turned philosophy in a more methodological direction. And, in a slightly disguised form, this is indeed the direction in which the subject has moved. It is not the illegitimate deployment of the a priori in history that is the chief concern, but whether these new theorists can escape the intellectually crippling implications of radical relativism, and whether indeed they offer a real prospect of genuine knowledge and understanding. If all is in flux, is there any Archimedean point from which this judgment itself is to be made?

In this way philosophy of history, in common with many other branches of philosophy, is best understood as a series of repeated attempts to organize knowledge and insight into a coherent whole, one characterized by a constant dialectic between philosophical criticism and historical understanding.

Hobbes, Thomas (1588-1679)

Among the figures who were conscious of developing a new science in the seventeenth century, the Englishman Hobbes stands out as an innovator in ethics, politics and psychology. He was active in a number of other fields, notably geometry, ballistics and optics, and seems to have shown considerable acumen as a theorist of light. His contemporaries, especially in Continental Europe, regarded him as a major intellectual figure. Yet he did not earn a living as a scientist or a writer on politics. In 1608 he entered the service of Henry Cavendish, First Earl of Devonshire, and maintained his connections with the family for more than seventy years, working as tutor, translator, travelling companion, business agent and political counsellor. The royalist sympathies of his employers and their circle determined Hobbes' allegiances in the period preceding and during the English Civil War. Hobbes' first political treatise, The Elements of Law (1640), was not intended for publication but was meant as a sort of long briefing paper that royalists in parliament could use to justify actions by the king. Even Leviathan (1651), which is often read as if it is concerned with the perennial questions of political philosophy, betrays its origins in the disputes of the pre-Civil War period in England.

For much of his life the aristocrats who employed Hobbes brought him into contact with the intellectual life of Continental Europe. He found not just the ideas but also the spokesmen congenial. Perhaps as early as 1630 he met Marin Mersenne, then at the centre of a Parisian network of scientists, mathematicians and theologians that included Descartes as a corresponding member. It was to this group that Hobbes attached himself in 1640 when political events in England seemed to him to threaten his safety, causing him to flee to France. He stayed for ten years and succeeded in making a name for himself, particularly as a figure who managed to bring geometrical demonstration into the field of ethics and politics. His De cive, a treatise that has much in common with the Elements of Law, had a very favourable reception in Paris in 1642.

By the time De cive appeared, Hobbes had taught himself enough natural philosophy and mathematics to be taken seriously as a savant in his own right. He had also conceived the plan of producing a large-scale exposition of the 'elements' of philosophy as a whole - from first philosophy, geometry and mechanics through to ethics and politics. De cive would be the third volume of a trilogy entitled The Elements of Philosophy. These books present Hobbes' considered views in metaphysics, physics and psychology against the background of a preferred scheme of science.

Metaphysics, or first philosophy, is primarily a definitional enterprise for Hobbes. It selects the terms whose significations need to be grasped if the principles of the rest of the sciences are to be taught or demonstrated. Foremost among the terms that Hobbes regards as central are 'body' and 'motion'. According to Hobbes, the whole array of natural sciences can be organized according to how each treats of motion. Geometry is the first of these sciences in the 'order of demonstration' - that is, the science whose truths are the most general and on which the truths of all the other natural sciences somehow depend. Mechanics is next in the preferred order of the sciences. It considers 'what effects one body moved worketh upon another'. Physics is the science of sense and the effects of the parts of bodies on sense. Moral philosophy or 'the science of the motions of the mind' comes next, and is informed by physics. It studies such passions as anger, hope and fear, and in doing so informs civil philosophy. Starting from the human emotional make up, civil philosophy works out what agreements between individuals will form commonwealths, and what behaviour is required within commonwealths to make them last.

The behaviour required of the public in order to maintain a commonwealth is absolute submission to a sovereign power. In practice this means abiding by whatever a sovereign declares as law, even if those laws appear to be exacting. Law-abiding behaviour is required so long as, in return, subjects can reasonably expect effective action from the sovereign to secure their safety and wellbeing. With minor variations, this is the theme of all three of Hobbes' political treatises - the Elements of Law, De cive and Leviathan. Government is created through a transfer of right by the many to the one or the few, in whom an unlimited power is vested. The laws of the sovereign power may seem intrusive and restrictive, but what is the alternative to compliance? Hobbes' answer is famous: a life that is solitary, poor, nasty, brutish and short. This conception of life without government is not based on the assumption that human beings are selfish and aggressive but, rather, on the idea that if each is their own judge of what is best, there is no assurance that one's safety and one's possessions will not be at the mercy of other people - a selfish few, a vainglorious minority or even members of a moderate majority who think they have

to take pre-emptive action against a vainglorious or selfish few. It is the general condition of uncertainty, in conditions where people can do anything they like to pursue their wellbeing and secure their safety, that Hobbes calls 'war'.

1 Life

Hobbes was born in Westport, a parish of the town of Malmesbury in Wiltshire, England. His mother came from a yeoman family; his father was a poorly educated vicar who seems to have left his parish in disgrace, deserting his family after having come to blows with another clergyman early in Hobbes' childhood. Hobbes' uncle subsequently supported the family, and it was he who paid for Hobbes' university education. Hobbes was lucky to receive good schooling locally, and he showed an early talent for the classical languages.

In 1602 or 1603, Hobbes began study towards an arts degree at Magdalen Hall, Oxford. From his criticisms of the universities in his published writings, it is sometimes inferred that he disliked his college days, or at least that he disliked the scholasticism of Oxford at that time. (Scholasticism - the fusion of Christian with ancient Greek thought, especially the thought of Aristotle - dominated the curricula of the schools and universities of Europe in the sixteenth and early seventeenth centuries - see Medieval philosophy.) Certainly he disliked the university curriculum in retrospect, as chapter 46 of *Leviathan* (1651) makes clear.

Hobbes completed his degree in 1608, and entered the service of William Cavendish, First Earl of Devonshire, as companion and tutor for his son. Although Hobbes was about the same age as the young Cavendish, he was put in charge of his purse as well as his education. He was the earl's representative at meetings of the Virginia Company, in which the Devonshire family had a considerable financial stake. He also accompanied the earl's son on a grand tour of the Continent in 1610, which allowed Hobbes to improve his command of French and Italian. According to some accounts, he also became acquainted then with criticisms of scholasticism current among Continental intellectuals.

It is unclear how long this grand tour lasted, but Hobbes had returned to England by 1615. At some point during these travels Hobbes seems to have met Fulgenzio Micanzio, the friend and personal assistant of the Venetian writer and politician Paolo Sarpi. He must also have met Marc Antonio de Dominis, who was involved in the translation of Bacon's writings into Italian and who also had connections with Sarpi. Hobbes' own contact with Bacon may have had its stimulus in the requests of the newly befriended Venetians for more details of the Baconian philosophy. The young Cavendish began a correspondence with Micanzio after returning to England in 1615. Hobbes translated this correspondence and through it would have been exposed to Sarpi's theory of the supremacy of temporal rulers rather than spiritual authorities. The theory went against the Papal interdict of 1606, which asserted Rome's right to overrule the decisions of local monarchs and which had encountered much criticism in England. There are apparently strong echoes of this anti-Papal line in Hobbes' own writings.

During his first twenty years of service to the Devonshires, Hobbes seems to have spent his free time immersed in classical poetry and history. His employers had a good library, and Hobbes made use of it. The first fruit of this regrounding in the classics was a translation into English of Thucydides' *History of the Peloponnesian Wars*, published in 1628. Hobbes believed that Thucydides had lessons for those who overvalued democracy and did not see the strengths of monarchy, and it may have been the Petition of Right of 1628 that led to the publication of the translation. The Petition called on Charles I not to levy taxes without the consent of Parliament, not to imprison subjects without due cause, not to billet soldiers in private homes and not to put civilians under martial law.

In 1628 Hobbes chose history as the medium for a political message. Later, in writings like *Leviathan*, he thought science or philosophy was the better vehicle. In the writing of history it is possible for the conventions of the genre to interfere with the communication of wisdom; in the writing of science, he came to believe, the communication of wisdom is assured, if the audience is prepared to pay attention and able to follow a demonstration. He struggled throughout his intellectual life with the problem of combining political rhetoric with political science, and some of his best writings are experimental solutions to this problem. The translation of Thucydides is important as the first of many such experiments.

The year 1628 was a kind of turning-point in Hobbes' career. Apart from publishing the translation of Thucydides, he had to contend with the death of the second earl at the age of 43, resulting in his loss of employment with the Devonshires. Hobbes took up a new post in the house of Sir Gervase Clifton, not far from Hardwick Hall, the

home of the Devonshires. Once again he was engaged as a companion on a grand tour, this one lasting from 1629 to 1631. During this journey Hobbes looked for the first time at Euclid's *Elements*, and fell in love with geometry. There is plenty of evidence in Hobbes' writings that he regarded Euclid's book as one of the supreme examples of a scientific presentation of a subject. Perhaps also during this second journey to the Continent Hobbes was present at a discussion among some well-educated gentlemen about the nature of sense-perception, in which it emerged that none of the participants could say what sense-perception was. Both episodes are significant, because they seem to mark the beginning of Hobbes' transformation from man of letters to man of science.

Perhaps the stimulus for the change was not the second grand tour alone. After his return, Hobbes went back into the service of the Devonshires and became tutor to the young third earl. At about the same time, he came into contact with a branch of his master's family who lived at Welbeck, near Hardwick Hall. The Welbeck Cavendishes were interested in science. The Earl of Newcastle is known to have sent Hobbes on an errand to London to find a book of Galileo's in the early 1630s. The earl's younger brother, Charles, had an even greater interest in science: he acted as something of a patron and distributor of scientific writings. Hobbes was one of those who looked at and gave his opinion of these writings. Charles Cavendish also had contacts among Continental scientists, including Marin Mersenne, a friar in Paris who was at the centre of a circle of scientists and philosophers that included Descartes.

Hobbes' scientific development continued when he embarked with the third earl on yet another grand tour from 1634 to 1636. During this journey he is supposed to have met Galileo in Italy, as well as Mersenne and some members of his circle in Paris in 1636. Hobbes had probably become acquainted with Mersenne five years earlier on the second tour. It is said that on the third grand tour Hobbes was much preoccupied with the nature and effects of motion, and that he started to see for the first time how many natural phenomena depended upon it.

On his return to England, Hobbes kept up with some of the scientific work being produced in Mersenne's circle. Descartes' *Discourse and Essays* were published in 1637. Hobbes was sent a copy and seems to have made a careful study of the first of the *Essays* - on optics - perhaps taking time himself to write something of his own on the same subject. But he was not keeping abreast solely of scientific ideas. Through his association with a circle of clergy, lawyers and aristocrats at Great Tew, near Oxford, he was able to follow the continuing debates surrounding the troubles of Charles I. In 1634 the king started to raise funds for a navy by a ship-money tax levied county by county. This tax-raising met opposition, particularly in non-coastal counties. Besides the ship-money dispute, Charles I had to reckon with the consequences of trying, in 1637, to bring the Scottish Presbyterian prayer book into line with its Anglican counterpart. This provoked a National Covenant in Scotland expressing wholesale opposition to ecclesiastical innovations from England. In 1639 and 1640 the Scots raised armies to back up their opposition, and Charles was forced to recall a parliament he was used to ruling without, and which was extremely hostile to him. When Parliament acted against Stafford, a minister of the King associated with the Earl of Newcastle, Hobbes worked on arguments that could support the royalist position in parliamentary debates. The arguments were produced in a treatise, *The Elements of Law* (1640), not intended for publication but which, in fact, contains much of the doctrine of Hobbes' political philosophy. Fearing that he would be prosecuted for giving the royalists their arguments, he fled to Paris and joined the circle of philosophers and scientists around Mersenne.

Some years after 1640 Hobbes wrote that he had recently conceived a plan for expounding, in three parts, the elements of philosophy or science in general. His exposition would begin with the nature of body and the elements of what we now call physics. It would go on to discuss human nature, in particular perception and motivation, and the third part would be a discussion of moral and civic duty. Perhaps he had already drawn up this plan, and even executed some of it, by the time he reached Paris. What *is* certain, however, is that the first part of the exposition to be published was the last of the three in his outline - the part on morals and politics. Hobbes called this part of his exposition *De cive* and published a very limited edition of it in Latin in 1642.

Hobbes seems to have enjoyed good relations with most of Mersenne's circle. He was at odds with Descartes, however, whose *Meditations* he criticized in a set of 'Objections' - the anonymous 'Third Set' (see Descartes, R. §§4, 6). From 1641 until Mersenne's death in 1648, Hobbes applied himself to the composition of the rest of his three-part exposition of the elements of science. He produced some of the material for the first part of the exposition - on body, the part published in 1655 as *De corpore* - and took up topics that would later occupy the middle part of the exposition. In 1643 he wrote a critical commentary on *De Mundo*, a treatise written by Thomas

White (another Englishman in Paris at that time) which was sympathetic to scholasticism. In 1646 Hobbes composed some arguments about the respects in which freedom is compatible with causal necessitation in nature, arguing once more on this occasion against scholastic positions. He suffered a serious illness in 1647 and almost died. While on his sickbed he rebuffed an attempt by Mersenne to convert him to Roman Catholicism.

In 1648 Mersenne died and the philosophical and scientific activity that had gone on around him ceased to have a focal point. Hobbes now had a place among the royalists in exile, but he was on poor terms with churchmen around England's exiled Charles II in Paris and was receiving his pay rather irregularly. By the autumn of 1649 he seems to have formed the intention of going home.

Leviathan, in which Hobbes attempted to derive from his now well-worked-out political principles the right relation of Church to state, was written at the end of the 1640s, when church government in England began to run on lines of which he approved and at a time when the influence of bishops in the English royal court-in-exile in Paris was, in Hobbes' eyes, too great. In any case, the fact that the theory in the book vindicated Cromwell's policy on church government does not mean that it was a partisan work in favour of Cromwell, calculated to ease Hobbes' return to England. If that had been so, Hobbes would not have made a special presentation copy for the future Charles II. Instead, it seems that the doctrine in *Leviathan* favoured the concentration of all authority in any *de facto* sovereign power, whether republican or royal. To the Paris royalists, mostly strong Anglicans in favour of political powers for bishops, the new book was highly offensive.

By the end of 1651 Hobbes was back in London and all three statements of his political philosophy were available in some form in English. These political works were widely known and read before his exposition of the elements of science was complete. Even though *De cive* had been planned to complete a sequence of three treatises on these elements, it did not depend on the other treatises in order to be understood, and it has always had a readership of its own. When the other two works in the sequence appeared in the 1650s, they did not match *De cive* in quality. The treatise on which Hobbes had been working longest was the opening work of the sequence, *De corpore*, published in 1655. In it Hobbes tried to show how the mature sciences of geometry, mechanics and physics were concerned with the effects of different kinds of motion in matter. Politically motivated critics soon exposed the weaknesses in the mathematical sections of the book, and Hobbes' attempt to vindicate his work involved him in years of fruitless polemic. *De homine*, the second volume of his *Elements* and undoubtedly the least well-integrated of the three, was published in 1658. It was never widely read, and a modern English translation of it has only recently appeared.

In 1660 the monarchy was re-established in England, and on the coat-tails of Charles II there returned to political power many who regarded Hobbes as a traitor to the royalist cause. Charles himself was not hostile, however, and other influential people were also well-disposed towards him. Nevertheless, in 1666 and 1667, Parliament came close to passing a bill outlawing Christian heresy and atheism, and *Leviathan* was specifically investigated as a source of heretical and atheistic views. The danger of imprisonment and exile did not dissipate until the end of the decade. The threats to Hobbes were reflected in additions that he made to an edition of his works published in 1668. He argued that punishment for heresy was illegal under English law and that his materialism was compatible with Christian faith. Two significant works from the 1660s were applications of his political philosophy. There was a history of the English Civil War, *Behemoth* (1668), and the *Dialogue between a Philosopher and a Student of the Common Laws of England*. By the time these works were composed, Hobbes was not permitted to publish, and though he busied himself with some translations of the classics and a few other minor writings of his own in the 1670s, he had come almost to the end of his working life.

In his ninetieth year, Hobbes returned to physics. His *Decameron Physiologicum* (1678) restates some of the methodology and principal results of the physical sections of *De corpore*. For the preceding three years Hobbes had divided his time between the two Devonshire houses of Chatsworth and Hardwick. In December 1679 he died of a urinary complaint. His remains are buried in a small parish church near Hardwick.

2 Science and human improvement

Hobbes' writings are those of an advocate and practitioner of a new science, a system of knowledge of causes that could, as he believed, greatly benefit human life. Yet he formed his ideas during a period when human intellectual powers, including the ability to develop science, were commonly thought to be limited. According to some theories prevalent in the late sixteenth and early seventeenth centuries, the whole human race was involved in a

quite general and unstoppable process of natural decay, so that all the best achievements of human beings belonged to a long-lost golden age. It was a way of understanding things that was consistent with, if not inspired by, the Biblical story of the Fall of Adam and Eve, and the loss of paradise. According to some understandings of that story, Adam's expulsion from paradise cost him not only a life of ease in harmony with God and the rest of nature, but also the gift of a natural insight into the natures of all the things he could name. Regaining the knowledge of those natures might never be possible. In France, in the late sixteenth and early seventeenth centuries, recently popularized Greek sceptical arguments against dogmatism reinforced the view that human intellectual possibilities were limited (see Scepticism, Renaissance §§1, 4). The arguments were directed not only against the traditional learning of the schools but against the idea that any human learning - even untraditional or anti-traditional learning - could amount to a system of genuine knowledge. Hobbes' philosophy of science stands in opposition to much of this gloomy theorizing. It stands in opposition to philosophical scepticism, to the theory of the decay of nature as applied to the human intellect and, to a lesser extent, to pessimistic interpretations of the intellectual costs of the Fall.

Although Hobbes had close friends and intellectual influences among French thinkers who took sceptical arguments seriously, there is little if any solid evidence in his own writing that he studied these arguments closely or took their conclusions to heart. He seems never to have doubted the soundness or scientific status of Euclid's geometry, and he was an early enthusiast for the applied mathematics of Copernicus, Kepler and Galileo. He was also proud of the judgment of some early readers of *De cive* that this book ushered in a demonstrative science of ethics. Hobbes called himself the inventor of civil science and thought that his politics deserved a place alongside Galileo's mechanics. The newly founded natural and moral sciences he regarded not only as great intellectual achievements, but as distinctively modern ones. Contrary to the theory of the decay of nature as applied to the human intellect, natural and civil science had not ceased with the ancients, but had only properly begun with the work of the mathematical astronomers and his own work in *De cive*. However, Hobbes also held that human beings were badly adapted by nature to do science of this kind, and that they had to work very hard to be capable of it. He thus disagrees both with the Cartesian idea that God benignly creates us with the ingredients of science latent in our minds *and* with the Aristotelian idea that knowledge of the natures of things is the unforced and inevitable by-product of repeatedly looking and seeing. To a very significant extent, according to Hobbes, our capacities for natural science are made by us rather than given to us. This position concedes something to both scepticism and the theory that life will always be difficult for Fallen Man. Although sceptics are wrong to claim that we are incapable of science, they would not be wrong to claim that we lack native scientific ability. Neither would they be wrong to deny that human beings are capable of an exalted sort of knowledge, the knowledge of what necessitates effects. For Hobbes, the scientific knowledge of which we are capable rarely rises to the level of knowledge of how effects *must* have been brought about, and it is not taken to extend to all effects. Again, although Hobbes believed that the scientific achievements of his contemporaries and himself were important, and that the then nascent sciences of nature and politics would develop further, he did not, with Descartes, suppose that we might one day complete science. Finally, while he claimed that even in their undeveloped state the sciences had delivered considerable benefits, Hobbes did not expect a more developed science to be the answer to all our problems. Like Bacon he believed that science could not entirely repair the Fall, that it could only act to relieve some of what was bad in human existence. Whatever one did, life would continue to have 'incommodities', but with the development of science life would contain fewer of them.

Science is not, then, for Hobbes, a means of regaining Eden. At best, it is our only way of cutting the costs of losing Eden. In paradise, Adam enjoyed the gift of immortality in conditions of ready abundance. Everything he could properly want was there for the taking. Punished for eating from the tree of knowledge Adam lost his immortality. He lived, as Hobbes puts it in *Leviathan*, under a death sentence ([1651] 1839 III: 438). Adam also lost the abundance of Eden. Banished to a place outside paradise, he had for the first time to work for a living, and to do so in a relatively inhospitable environment. Had they stayed in Eden, Adam and Eve would not have reproduced their kind continually or perhaps at all ([1651] 1839 III: 440). When they left they came under a necessity to multiply that worsened the life of their kind still further. Adam's descendants, the rest of humanity, inherit from him not only their mortality but also life outside Paradise. Thanks to Adam's transgression, human beings in general live in a world that demands ingenuity and hard work for survival. And thanks to human carnality, Adam's descendants have to eke out a living in the company of, and often in competition with, many others of their own kind. These facts of life do not make it easy to do well. In order to flourish in a sometimes

harsh physical environment people have to know which effects they observe are beneficial and which are harmful, and they have to learn to reproduce the beneficial ones and prevent, or at least avoid, the harmful ones. In order to flourish in a heavily populated environment people have to know how to co-operate with one another. Moreover, these problems have to be coped with simultaneously.

As things naturally are, however, the problems are too great for creatures like us. For, being descended from Adam, human beings inherit the cognitive and conative capacities of someone designed to live in paradise, not the harsh world outside. If things had gone according to God's plan, Adam would not have needed to get causal knowledge of nature; he could have satisfied himself with contemplating the diversity and order in nature. Adam would not have had to make nature supply his needs. He would not have had to cope with overpopulation and the demands of co-operation. Made for a life without problems, Adam lacked the means - that is, the science - to solve problems. As Hobbes points out in *Leviathan*, there is no evidence in scripture that Adam had the vocabulary to do science ([1651] 1839 III: 19), and yet without the vocabulary to do science we should be no better off than savages or beasts (1640 pt I, ch. 5: iv; 1658 ch. 10: ii, iii). Either people reconcile themselves to living at the mercy of the elements and of one another - Hobbes thought that this was the course taken by Native Americans - or else they take the long and difficult road to a better life through science. Neither the better life nor the means to it are out of bounds to human beings, but both involve a kind of human reform. To get access to the degrees and varieties of motion that are required to understand nature, human beings need to acquire concepts more general and universal than those for everyday experience, and they need to apply principles involving these concepts in tasks of measurement and manufacture. To solve the problems of peaceful co-operation they need to be able to recognize the consequences of everyone's trying to get what they want. This means more than knowing what moral precepts to follow. It means being able to see what overall good the moral precepts promote - something revealed by Hobbes' civil science - and adjusting one's practical reasoning to the pursuit of that good rather than something nearer and more gratifying.

Although human beings cannot live well without science, science does not come naturally to them. Science depends on the ability to impose names aptly, to join names into propositions, and to join propositions into syllogisms, but not even these prescientific linguistic skills are natural to people. People come into the world being able at most to form sensory representations of things, and to learn from experience. But experience is a far cry from science. In its raw state experience is either a disorganized stream of representations or else a coherent sequence. If it is a coherent sequence, then, according to *Leviathan*, it is 'regulated' by some design or plan, or by curiosity about an observed body's effects ([1651] 1839 III: 13). Regulated in either way, a train of experience is only regulated as past experience allows it to be. Going by its past associations of observed phenomena, the mind will focus on a means to some goal or purpose in hand, or will suggest properties it is accustomed to conjoin with other properties it is now curious about. Once there are words for the things of which the mind has conceptions - words that can be used to signify the elements of experience - the possible ways of juxtaposing the words significantly, of analysing them and drawing consequences, introduce ways of ordering the elements that are not foreshadowed in previous experience.

New ways of regulating thought become possible because, for one thing, it is not necessary for a body spoken about to be present or remembered in order for a train of thought about it to be created. The train of thought can be generated instead by exploiting logical relations or analytic truths to get from one speech or thought to another. Reasoning can thus introduce new possibilities of combining things given separately in experience; it can also introduce ways of taking apart or separating things confounded in experience. Nor are the possibilities confined to the powers of one man's reasoning. Speech enables investigation and reasoning to be carried on co-operatively, and allows one person's explanations to be tested for clarity and coherence by others. The reasonings or explanations of one person can be preserved over time and made the model for those of many other people. A method can even be extracted from the findings of the most successful or conclusive pieces of reasoning, so that conclusive reasonings and explanations - in a word, science - can deepen and spread.

Hobbes believed that science as a whole could be divided into two principal parts, one concerned with natural bodies, the other with bodies politic. Each part of science arrives by reasoning at the causes of the properties of its subject matter; and demonstrates effects, with a view to making the relevant subject matter useful and beneficial to human beings. But the two types of bodies are very different from one another, and pose different scientific problems. Natural bodies are not made by us, and so the causes of their properties have to be worked out by

reasoning from the appearances they present. Since the maker of natural bodies, God, is omnipotent and able to bring about effects in more ways than can be dreamed of in our explanations, only possible causes can be assigned to the appearances they present. Bodies politic *are* made by us - they are human artefacts and so at least in principle we can be certain of the causes of *their* properties. But the philosophical challenge they present is not primarily that of knowing their causes: it is that of knowing how they should be designed so that they last. This means setting out rules by which those involved in the commonwealth - those in government on the one hand and those subject to government on the other - can conduct themselves so that civil peace is ensured. It is doubtful whether the statement of these rules is really a science of a kind of body, as is natural science, and probably the differences between natural and civil science are to be taken more seriously than the supposed analogies. Hobbes claims that civil science is not only more certain, but more widely needed, and more accessible than natural science. On the other hand, natural science is the more fundamental of the two parts of science: its explanatory concepts are more general than those of civil science and are needed if a scientific understanding of the passions and actions of agents in civil life is to be acquired from the ‘first and few’ elements of science as a whole.

3 The elements of philosophy: logic and metaphysics

The relative positions of the two parts of science - natural and civil - are reflected in the organization of Hobbes’ trilogy on the elements of philosophy. The first volume, *De corpore*, expounds first philosophy, geometry, mechanics and physics. It is followed by *De homine*, which is half optics and half psychology; this volume in turn is supposed to prepare the ground for the exposition of the elements of ethics and politics in *De cive*.

The account of the ‘elements’ of science starts in *De corpore* with chapters on the ways in which philosophy depends on names, propositions and methods of reasoning. For Hobbes, logic is nothing more than the right ordering and joining of significant propositions into chains of reasoning. Propositions in turn are no more than coherent concatenations of names with significations of different extents. A name signifies an idea - whatever idea it conveys in the context of a speech to a hearer. But the idea is not what the name refers to or stands for: it refers to or stands for an object. To make a proposition, names have to be put together coherently, and coherent concatenations are concatenations of the same category of name - names of bodies with names of bodies, names of names with names of names. The ‘extent’ of the signification of a name has a bearing on the truth of propositions. The signification of a proper name will extend to an individual, that of a universal name - ‘man’, ‘horse’, ‘tree’ - to each of a plurality of individuals. In the propositions of natural science, names are universal names of bodies. Truth in the propositions of natural sciences is a matter of the inclusion of the extent of a universal subject-term within the extent of a universal predicate-term. Demonstrations are chains of syllogisms, and syllogisms are the stringing together of trios of propositions that share appropriate subjects and predicates. In a sense, then, logic is a technique for working out the consequences of relations between the significations of universal names or their extents. There are also methods belonging to logic for analysing the significations of names, and for arriving at the most general of these significations from a starting point in everyday universal names. Logical analysis of this kind is what is required to locate the terms fundamental to the various branches of science; it also has a role in making scientific questions amenable to resolution. Metaphysics or first philosophy sets out, ideally by means of definitions, the concepts necessary for conducting fruitful enquiries concerning natural bodies and for communicating the results. The relevant concepts include those of body, motion, time, place, cause and effect.

Hobbes composed no full-scale treatise on logic, and no work of his is concerned with metaphysics alone. *De corpore* contains the nearest approximation to a full first philosophy, and even here he is not entirely clear about the borderline between that ‘prior’ science and geometry. There is a chapter on ‘syllogism’, but it is not comprehensive and its relation to traditional syllogistic is never spelled out. As for the chapters on first philosophy, they are more significant for what they deny than for what they affirm. They deny that it makes sense to study ‘being’ in the abstract; they deny that species or genera are things; they deny that ‘substance’ can mean something very different from ‘body’; and they deny that other predicables are more than varieties of sensory appearance caused by bodies. In short, they deny much standard Aristotelian doctrine, including the doctrine defining the subject matter of metaphysics itself - the doctrine that metaphysics studies being *qua* being. As will become clear, the chapters on first philosophy can also be understood to register disagreements between Hobbes and some of the *moderns* -Descartes and Gassendi, among others.

Hobbes’ first philosophy starts with a thought experiment. He imagines that the external world has been

annihilated - all that remains is a single thinker and the traces in memory of the world he previously sensed and perceived. Hobbes claims that the disappearance of the external world would not take away conditions for thought or reasoning, even about the physical world. The annihilation of the world would not even *alter* conditions for such thought and reasoning, since the medium of thought and reasoning is never things themselves but only appearances or phantasms. Hobbes thinks that the annihilation of the external world leaves only the mind and its phantasms in existence. There is no third world of things that exist outside the mind but outside the physical world as well. So Hobbes denies that there exist without the mind abstract natures such as Descartes claims to discover in Meditation V; and, contrary to Gassendi in the *Syntagma*, he does not think that space and time are real independently of the mind. He derives the idea of space from the memory images or phantasms presenting things as if from outside the mind. He derives the idea of time from imagined motion, from succession without existence. He derives the idea of an existing thing from the imagination of an empty space suddenly getting an occupant. Existence is thus restricted to existence in space, which is in turn identified with corporeal existence. These resources allow for only a straitened conception of cause or power, and certainly not for an Aristotelian conception. There are no forms or purposes in nature; but the makings of a conception of efficient cause are available, and that is the only sense of 'cause' recognized by Hobbes' first philosophy.

Most of the concepts that Hobbes thinks are needed for natural science have now been indicated. In Part Two of *De corpore*, after defining 'time' and 'place', he thinks he is in a position to define 'body' and its most general accidents. He then deals with magnitude or real space-occupation, and the spatial relations of continuity and contiguity. Against this background he defines 'motion', and in terms of motion the ideas of length, depth and breadth. After the three spatial dimensions are explicated, he defines quantitative identity and difference for motions and bodies, and then discusses the conditions of qualitative difference between bodies over time. He goes on to consider the causes of qualitative change, concluding with a demonstration of the thesis that all change is motion, that motion is the only cause of motion, and that power (*potentia*) is nothing but motion in so far as it is a cause of motion.

Definitions dominate Hobbes' first philosophy and, officially at least, their purpose is to fix ideas necessary for the business of science proper. Hobbes thought that the mark of a prescientific branch of learning was controversy, and he traced controversy to a failure to define terms and to proceed in orderly fashion from definitions to conclusions. The task of first philosophy is to provide insurance against controversy. It does not do this by coming up with substantive truths that command assent. Instead, Hobbes describes first philosophy as a necessary *preliminary* to the demonstration of substantive truths, where demonstrator and learner are put on one another's wavelength and attach the same significations to their terms, but where their agreement is terminological rather than doctrinal. As Hobbes puts it in the *Six Lessons*, 'he that telleth you in what sense you are to take the appellations of those things which he nameth in his discourse, teacheth you but his language, that afterwards he may teach you his art. But teaching of language is not mathematic, nor logic, nor physic' ([1656b] 1839 VII: 225).

That 'the teaching of language' underdescribes what Hobbes does in practice in stating his first philosophy, and that it suppresses entirely the revisionary character of some of his definitions when compared with Aristotelian ones (and so the controversial nature of the devices that are supposed to pre-empt controversy), should already be clear. But, up to a point, Hobbes' first philosophy is genuinely unassuming. It takes for granted no exotic powers or substances, God included, and it postulates no exotic human capacities for acquiring the concepts that are the key to natural science. The point is not just that Hobbes keeps the relevant concepts to a small number, so that he is economical in the concepts he uses and also in his assumptions about the types of real things there have to be for these concepts to be applicable. Hobbes' first philosophy is also *naturalistic*. Nothing supernatural is assumed to exist in order for natural science to be acquired; indeed, nothing besides matter in motion is postulated. What remains after the annihilation of the world in Hobbes' thought experiment is not the immaterial self of Descartes, but the corporeal body or perhaps the brain, and the motions conserved in its internal parts from past impacts of the external world on the sense-organs.

The denial of immaterialism in Hobbes' first philosophy is anticipated in his Objections to Descartes' *Meditations*. An objection that Hobbes directs at Meditation II sets the tone (see Descartes, R. §5). He accepts that from the fact that I am thinking it follows that I exist, but he wonders whether Descartes can properly conclude, as a corollary, that the I is a mind or an intelligence or a thinking thing. For all the *Cogito* shows, Hobbes says, the I could be corporeal. And not only does the *Cogito* leave open the possibility of the I being corporeal, he goes on, the later

wax argument actually *shows* that the I is corporeal:

> We cannot conceive of jumping without a jumper, or knowing without a knower, or of thinking without a thinker.
>
> It seems to follow from this that a thinking thing is something corporeal. For it seems that the subject of any act can be understood only in terms of something corporeal or in terms of matter, as the author himself shows later [in] his example of the wax: the wax, despite the changes in its colour, hardness, shape and other acts, is still understood to be the same thing, that is, the same matter is the subject of all of these changes.
>
> (Hobbes [1641] 1985 vol. 2: 122)

Descartes' reply concedes that acts need subjects, that it is a *thing* that is hard, changes shape and so on, and also a *thing* that thinks, but he insists that 'thing' in this sense is neutral between the corporeal and the spiritual. He insists, too, that he is non-committal about the nature of the thing that thinks in Meditation II, a claim borne out by his responding agnostically in Meditation II to the question of whether he might be a structure of limbs or a thin vapour. If Hobbes misses that, it may be because he misunderstands the rules of the method of doubt. While implementing the method of doubt, Descartes does assume rather than prove that there is no body for the thinking thing to be or for the thought to inhere in. But this is not a case of begging the question, for the belief in the existence of bodies is reinstated in Meditation VI, and with that the question of whether the subject is essentially immaterial or material.

Hobbes comes at Descartes' immaterialism from another, more revealing direction when he tries to suggest that it is not needed to underpin the distinction between imagination and conception by the mind. In his fourth objection, Hobbes equates imagination in Descartes' sense with having an idea of a thing, and conception in Descartes' sense with reasoning to the conclusion that something exists. Descartes already agrees that imagination is a partly corporeal process resulting from action on the sense organs, but his text suggests that conception by the mind is an altogether different operation. Hobbes puts forward a suggestion that allows the explanation of conception and imagination to be linked, without the postulation of immaterial things. He proposes that reasoning is the process in which labels attached to various things are concatenated into sentences according to conventions agreed by humans.

> Reasoning will depend on names, names will depend on the imagination, and imagination will depend (as I believe it does) merely on the motions of our bodily organs; and so the mind will be nothing more than motion occurring in various parts of an organic body.
>
> (Hobbes [1641] 1985 vol. 2: 126)

The compatibility of this proposal with mechanistic explanation appeals to Hobbes; but Descartes raises some powerful doubts about Hobbes' idea that names alone come into reasoning. Contrary to Hobbes, Descartes takes it that reasoning is a matter of linking together the significations of names, not just the names themselves, and also that the significations of some names cannot be imaged.

As in the case of his objection concerning the subject of the thinking, which seems to overlook the constraints of the method of doubt, Hobbes' objection to Descartes on imagination and conception seems to miss the point. Descartes is not trying to explain the workings of the faculties that result in science, only to find that he has to explain them on immaterialistic principles. He is trying to show that science is possible, that real knowledge of the physical world is possible, because not all of our faculties can coherently be held to be unreliable. Conception by the mind is a case in point. It cannot be held to be unreliable, because it is autonomous and independent of unreliable sense-perception. Hobbes does not see that it is the objectivity of conception rather than the process of conception that Descartes is concerned with. And doubting the objectivity of conception himself, Hobbes does not seek to reconstruct conception as reasoning that might be guaranteed to lead to true conclusions; he wants only to reconstruct it in ways that will not multiply entities beyond those required by mechanistic explanation. The point is that a proof of the objectivity of the conceptions arrived at by science may legitimately be demanded of a metaphysics, and Hobbes' metaphysics does little if anything to meet the demand. The metaphysical economy of materialism will not impress someone who is sceptical of the existence of the external world: the undeniability of the *Cogito* might. One cost of Hobbes' naturalistic approach is that it never attempts the task of legitimizing the scientific enterprise in general, and is probably incapable of doing so.

4 Geometry, optics and physics

First philosophy is a preliminary to natural science proper, and the first of the natural sciences is geometry. Geometry is a natural science for Hobbes, because it studies the effects of moving bodies. It studies the properties of straight lines, for instance, and straight lines are the effects of the motion of a small material thing - a point. He rejects the idea that the geometrical point is an abstraction distinct from some small material mark or other. Being a body, a geometrical point is divisible and not, as Euclid had it, ‘that which hath no part’. A point could no more lack quantity than a line could lack breadth and be constructed by motion. The bodies whose motions geometry studies may not have much quantity, and the quantity may not be relevant to what is being demonstrated of them, but they are bodies all the same. Though geometry is a science of bodies, it is also in a sense an a priori certain science, as physics is not, for the effects are produced by us, and we know in advance by what means they are produced. In this, Hobbes believed, geometry is like politics. In a sense, too, geometry is a very basic science - basic not in the sense that the objects it studies are higher or more real than those in nature, but in the sense that it studies bodies and motion at a very high level of generality, with much that is specific about the bodies left out of account. Hobbes thinks that geometry is also basic in another sense, for its methods of demonstration and analysis are the inspiration for the methods of the other demonstrative sciences.

Hobbes was self-taught in mathematics, and his friend and biographer, John Aubrey, says he did not encounter Euclid until he was middle-aged. Nevertheless, he was taken seriously by very able geometers in Mersenne’s circle, and is even credited with inspiring a proof by Roberval of the equality of arcs of a parabola and an ‘Archimedean’ spiral. He is much better known, however, as a mathematical failure whose attempts at expounding geometry in *De corpore* were ridiculed by the English mathematician John Wallis. Wallis’ attack was motivated by a wish to discredit the anticlerical passages in *Leviathan*, and its attack on the universities. In correspondence with Huygens, Wallis said that Hobbes ‘took his courage’ from mathematics, and so it ‘seemed necessary for some mathematician to show him how little he understands’. Wallis’ attack succeeded - it focused on Hobbes’ doomed enterprise of producing a quadrate of the circle - and was made the more effective by Hobbes’ persistent refusal to concede errors.

Although the geometrical parts of *De corpore* were supposed to present some new results, Hobbes did not claim any great stature for himself in geometry. In optics, on the other hand, he regarded himself as a major figure. It was certainly a subject he turned to early in his transformation from man of letters to man of science. As early as 1636, optical questions were featuring in his correspondence with the Earl of Newcastle, and the treatment of the sensible qualities was mechanical: ‘whereas I use the phrases, the light passes, or the colour passes or diffuseth itselfe, my meaning is that the motion is onely in the medium, and light and colour are but the effects of that motion in the brayne’. Perhaps more accurately, these effects were supposed to be the effects of the motion of the medium transmitted to the animal spirits in the brain.

Exactly how early Hobbes arrived at his conception of the workings of light is not entirely clear. A short treatise dated to 1630 and originally attributed to Hobbes is now thought by some scholars to be the work of someone else in the Cavendish circle. It contains doctrines different from writings that are more certainly ascribed to Hobbes, and which probably belong to the 1640s: the *Tractatus Opticus* I and II. It also contains as ‘principles’ formulations that these later optical writings present as mere hypotheses. Whether the writings of the 1640s represent only a change of mind or whether they are Hobbes’ first extended publications in optics, they show him adopting a mediumistic theory of the propagation of light based on the idea of continuously expanding and contracting light sources. These displace contiguous parts of an ethereal medium of uniform density and set up a chain reaction to the eye. A resistance in the eye caused by a countervailing motion from the brain produces a phantasm of a luminous object - that is, in Hobbes’ terminology, light. Light is propagated instantaneously, as both luminous object and medium expand simultaneously. The account does without the postulation of an emission by luminous objects of species or replicas of themselves which subsequently inform the senses and permit perception. Instead, luminous objects illuminate by radiation: they, so to speak, send out rays or, more precisely, displace the medium along paths called ‘rays’. In their passage from luminous objects to the eye, rays are supposed to describe parallelograms. Hobbes used the properties of other geometrical figures described by rays of light passing through different densities to account for refraction. Colour he regarded as light perturbed by the internal motions of rough or coarse bodies on its way to the eye. The differences between the colours on the spectrum from blue to red he accounts for as the product of refraction plus restraint or reinforcement of the lateral motion of rays of light that

goes with refraction.

At no point in the process that starts with the motion of the luminous objects and ends in the production of the phantasm does Hobbes depart from a mechanical model of the causes of sense-perception. His mature theory of optics is through and through an account in terms of matter and motion. But between the *Tractatus Opticus I* and the *Tractatus Opticus II*, he seems to have revised his ideas about the organs of sensory perception. Phantasms are said to come from the heart, rather than to result from the clash of incoming motions with motions from the brain. By 1646, when Hobbes produced *A Minute or First Draught of the Optiques*, the most polished of his optical treaties, the main lines of his doctrine were settled. In addition to material on light and its propagation, refraction and reflection, there are accounts of various kinds of sensory error.

Physics, understood as the theory of the causes of appearances to sense and of the nature of the objects of sense, is in part an offshoot of optics. It is expounded at the end of *De corpore*. By an 'object' of sense Hobbes means an external body that registers in experience as being the subject of certain qualities, and that sets off the process culminating in an 'act of sense'. The object of sense is not an idea or a sense-datum or a mental image, though such a thing may be the medium in which the object of sense is registered. The greatest of the objects of sense is the world itself, as registered from some point within it. But only a few intelligible questions can be asked about the world, and these cannot be conclusively answered. One can ask whether it is of finite or infinite magnitude, whether it is full or contains empty space, and how long it has lasted. Only the second of these questions is open to a scientific answer, and even then only to a probable conclusion, while the others are for lawfully appointed churchmen to discuss. Hobbes thinks that probably there is no vacuum, that the world is full, but that some of the bodies that make it up are invisible: thus the ether and 'the small atoms disseminated through the whole space between the earth and the stars'. He adopts Copernican and Galilean hypotheses in chapter 26 of *De corpore* to explain the order, motion and relative position of the planets. He also infers explanations of, among other things, the passage of the seasons, the succession of day and night and 'the monthly simple motion of the moon'.

Hobbes goes on to consider the bodies between the earth and the stars. Foremost among these is 'the most fluid ether', which he proposes to regard as if it were first matter. He supposes that its parts only receive motion from bodies that float in them, and impart none of their own. The bodies in the ether are supposed to have some degree of cohesion or hardness and to differ from one another in shape, figure and consistency. Any more specific hypotheses about them Hobbes adopted only to explain particular phenomena. He is, however, willing to venture that many such bodies are 'unspeakably little' or minute, since God's infinite power includes a power infinitely to diminish matter. Assumptions about intersidereal bodies inform his theories of the phantasms appropriate to the different senses, not only light but also heat, sound and odour.

5 Ethics

After *physics*,' Hobbes writes in chapter 6 of *De corpore*, 'we must come to *moral philosophy*; in which we are to consider the motions of the mind, namely, *appetite, aversion, love, benevolence, hope, fear, anger, emulation, envy &c*; what causes they have and of what they be causes' ([1655] 1839 I: 72). The use of the term 'moral philosophy' for the doctrine of the motions of the mind is unfortunate; elsewhere Hobbes says that the precepts of his natural law doctrine add up to a moral philosophy. 'Ethics' is another label he sometimes uses, and it is preferable. The reason ethics comes after physics is that the motions of the mind 'have their causes in sense and imagination, which are the subjects of physical contemplation'. What Hobbes means is that when a body registers in a sensory representation - when, for example, a person sees something - the thing imparts motion to the innermost part of the organ of sight. One effect of the motion is to set up an outward reaction which produces visual experience. But there can be a further after-effect. As Hobbes puts it in chapter 8 of *Elements of Law*, the 'motion and agitation of the brain which we call conception' can be 'continued to the heart, and there be called passion'. The heart governs 'vital motion' in the body, that is the circulation of the blood. In general, when motion derived from an act of sense encourages vital motion, the sentient creature experiences pleasure at the sight, smell or taste of the object and is disposed to move its body so as to prolong or intensify the pleasure. If the object of the pleasure is at a distance, then the creature will typically move towards it. There is a symmetrical account of displeasure. This is an after-effect of the act of sense consisting of a hindrance of vital motion. A creature experiencing a hindrance of vital motion will try to counteract it, typically by retreating from the object of sense. Aversion consists of the small inner movements that initiate the evasive action, just as 'appetite' names the internal

beginnings of approach behaviour.

The pursuit of pleasure and the avoidance of pain are the basic drives recognized by Hobbes' psychology, and they determine the systems of valuation of different individuals. The individual takes as good what it has learned to pursue and regards as bad what it has learned to avoid. In developing a system of valuation, a creature is not discovering an objective distinction in nature between things that are good and things that are bad. Nothing is good or bad independently of its effects on creatures, and the effects may vary from creature to creature. At most, things are good or bad *to* individuals, not good or bad 'simply and absolutely'. In the same vein, Hobbes denies that in the sphere of good and bad things there is one that is the highest and whose attainment constitutes happiness. Instead, there are many different goods for many different individuals. Becoming happy in life is not a matter of being successful in the pursuit of one favoured good, but of being continually successful in the pursuit of many.

Hobbes' account of the constraints on the pursuit of human happiness is the connecting link between his theory of the motions of the mind and his moral and political philosophy proper. To attain happiness, people need to know what goods to pursue and how to pursue them. But in the absence of a science of good and evil, pleasure is their main criterion of the good, displeasure the main criterion of bad. Both pain and pleasure, however, are unreliable guides to the good and bad. A person may find a thing pleasant on one occasion and call it 'good', only to change their mind later. Two people can react differently to the same thing, so that it produces pleasure in one and pain in the other, and is called 'good' and 'not good' simultaneously. Pleasure biases judgment in favour of the nearer and more intense good, even if the cost of pursuing this good is displeasure later, and so on. Part of the correction to these distortions is to judge the good of various things not by how they feel when they are enjoyed or shunned, but by the consequences of enjoying or shunning them. If the costs of the consequences outweigh the present benefits, then a supposed good may be merely an apparent good. Again, if someone detached from the pursuit or avoidance of a thing can judge it good or bad, then it may really be so; while if no-one else can see the attraction or repugnance, it may be illusory. Hobbes thinks only science can supply knowledge of the consequences of actions needed to counterbalance valuations derived from pain and pleasure; and he thinks science does not come naturally to people. Abiding by the value judgments of arbitrators does not come easily either, since people are attached to their valuations and unwilling to lose face by deferring to the judgments of others.

6 Politics: the state of nature

Despite the inconsistency in individual value judgments over time, and between the value judgments of different people at the same time, Hobbes thinks that there are some evils that are so large, and that interfere so markedly with everyone's pursuit of happiness, that practically no-one would knowingly pursue a course of action that resulted in them. War is such an evil, and Hobbes thinks he can show that if everyone makes themselves their own judge of what to pursue in the name of happiness, everyone will be involved in war. His argument to this conclusion is at the same time an argument for people to be guided by a judgment other than their own about what is best for them, the judgment of an existing civil power if they live in an existing commonwealth, the judgment of an as-yet-to-be designated civil power if they live outside any commonwealth.

The argument for the inevitability of war starts with assumptions about what is useful to the achievement of any goal. What is useful, no matter what good is being pursued, no matter whether the good is real or merely apparent, is power - that is, present means to future ends. 'Power' covers the physical capacities of individual agents, and also friends, riches and reputation. Not only is power in any form useful, but there can never be, according to Hobbes, too much power at the disposal of an agent in the nature of things. The reason is not that each agent naturally has an insatiable hunger for power, but that each agent is in competition with other agents for other goods, and any advantage one competitor temporarily has over another can, in principle, be overcome. The naturally strong can be toppled by a number of weak people who join forces; the man who has no enemies can be made into an object of hate with a well-judged campaign of character assassination; the wealthy can be robbed or swindled of their riches, and so on. Not only is it useful to acquire more and more power, but people cannot be blamed for doing so if all that organizes their activity in life is the pursuit of felicity.

Felicity is continual success in one's undertakings, whatever they may be. If what one undertakes is to do down one's competitors, then any means that helps to achieve it will be permissible. Or if, as is more likely, one aims at something else, doing down one's competitors can still often promote one's goal. Even the moderate man who wants only a small share of the good life can have reason to resort to foul means if he thinks he will lose

everything by playing fair with rivals. And he cannot be sure he does not risk losing everything if he plays fair. In general, the goal of felicity requires one to get an advantage and keep it. Disabling others is a means of keeping the advantage; the outright elimination of competitors is even surer. Because these facts can be discovered by everyone, everyone who pursues felicity must bargain for severe insecurity and even worry about survival. Struggling for survival is far removed from felicity, but the pursuit of felicity, no holds barred, can quickly turn into a struggle for survival. Or to put it Hobbes' way, in the state of nature, people who pursue felicity are in a condition of war.

The argument does not depend on the idea that every human being is naturally selfish. It is true that in *De cive* Hobbes paints an unflattering picture of ordinary human behaviour, emphasizing the tendency of people to look out for themselves, to say one thing to other people's faces and another thing behind their backs, the tendency to think very well of their own opinions, but poorly of the views of others, and to fight over trivialities. This is all ordinary human behaviour, but it is not the behaviour of absolutely every human being. That it is so ordinary is enough, in Hobbes' view, to overturn the Aristotelian idea that human beings are by nature fit for society, but he is not claiming that human beings are uniform, or that their behaviour is uniformly antisocial. Hobbes recognizes a variety of temperaments in human beings, and his state of nature encompasses the vainglorious as well as the moderate. The vainglorious will seek to dispossess others because having more than anyone else is an end in itself. Moderates will go on to the attack because they want only a little and fear that the greedy will take even that. Others again will be at odds because they want something that cannot be shared. Whatever the cause, the general effect will be insecurity, and with insecurity goes many unattractive things - not only feelings of fear, but loss of society, loss of production, loss of technology, loss of art, loss of everything that enables human beings to rise above a life of bare subsistence and savagery. Life in the state of war is, in Hobbes' famous phrase, 'solitary, poor, nasty, brutish, and short'.

Is there no such thing as virtue to keep people from pursuing felicity ruthlessly? Hobbes thinks that precepts enjoining the moral virtues - what he calls 'the laws of nature' - are discoverable even in the state of nature, but people are not morally obliged to act on them if they run the risk of dying as a result: the most basic law of nature is to preserve oneself, and there is an inalienable 'right of nature' to be one's own judge of how to secure one's own preservation and wellbeing. This right may be laid down in the interest of self-preservation, but never at the cost of self-preservation. So if one has reason to think that others will take advantage of one's keeping agreements, or of showing gratitude, of not being judge in one's own cause, of being forgiving and so on through the rest of the virtues, one is not obliged to behave in those ways. One is not obliged to act in a way which will advertise one's vulnerability to the unscrupulous. It is enough that one is willing to behave virtuously if it is not too dangerous.

7 Politics: the commonwealth

The answer to the problems of life in the state of nature is an agreement by most in it to delegate their right of nature to a person, or body of persons, empowered to secure the many against physical attack and against the severe deprivations of the state of nature. That person or body of persons is empowered by a collective submission of the wills of the many to the will of the one or few. The many agree to be guided in their behaviour by the laws of a sovereign, on the understanding that this is a more effective way of securing their safety than individual action in the state of nature. The many lend their wills to the sovereign both as potential enforcers of the law against lawbreakers and as an army of defence against foreign invasion. They lend their wills by doing only what is permitted by the sovereign's law and refraining from what the law prohibits. The law in turn expresses the sovereign's judgment regarding who should own what, who should teach what, how trade may be conducted, how wars should be waged, who should be punished and by what method of punishment, and who should be rewarded and the scale of the reward given.

The sovereign's judgment prevails because it, uniquely in the commonwealth, is still allied to a right of nature. Everyone who is subject to the sovereign thereby delegates their right of nature to the sovereign, but not in return for any forfeit or transfer of right by the sovereign himself. It is true that the commonwealth dissolves-that the obligation not to retract the right of nature lapses - if the sovereign is not able to secure the many against life-threatening incursion. But short of a reversion to the state of nature, the state in the person of the sovereign has a claim to expect the compliance of the many. The many owe it to one another to comply, because they agree between themselves to be law-abiding in return for safety if everyone else is law-abiding. They also owe it to the

sovereign, at least for the time that he succeeds in making and keeping the peace, because they voluntarily and publicly submit to the sovereign, signifying to him that they will do what he decrees should be done for their safety.

Hobbes' idea that the sovereign's law can justly reach into every sector of public life had clear application to the questions being debated during the Civil War period in England. Those who complained that it was wrong for Charles I to appropriate property, to billet troops at will, to raise taxes without the consent of parliament, were given a theory that legitimized those actions. According to the theory, the limitations on a king's powers indicate that a state of nature, with its potential for open war, still prevails. Either the powers of government are separated (in which case the contention between, say, king and parliament reproduces the contention between individuals in the pre-political condition), or else the powers of government are not separated, but are limited by the rights of the subjects (in which case the right of nature has not really been transferred, and people are still liable to prefer their own judgment about what is best for them to the judgment that they have agreed to be guided by, with the same potential for slaughter).

Hobbes' theory permits the sovereign to regulate public life very stringently, but his message to sovereigns - there is no doubt that *Leviathan* in particular was intended to be read by heads of state - was not that it was *wise* to regulate public life very stringently. To begin with, there were limits to what laws could do: belief could not be commanded, so a certain tolerance of freedom of thought was inevitable. Again, people could not be expected to risk their lives in order to obey the law, as that would leave them no better off in the state than outside it. So laws that impoverished people to such an extent that they were starving, having to steal in order to live, were ill-conceived. Likewise forced military service, if it were likely to lead to death, might reasonably be seen as unacceptable according to the terms of Hobbes' social contract. Even a regime of law that secured most people from theft and common assault, but that confiscated all income above a measly minimum, could be seen as a failure by the sovereign to come up with what the many bargained for in entering the state. What the many bargain for is safety and, as Hobbes explains in chapter 30 of *Leviathan*, 'safety' signifies more than a 'bare preservation': it means a modicum of wellbeing over and above survival.

The arguments from prudence against overregulation by the sovereign are also arguments against iniquitous practice by the sovereign. Hobbes distinguishes between iniquity and injustice. The sovereign does no injustice to his subjects if he decides to claim as his own all the land in a particular county or all the houses in a village: in creating the sovereign, his subjects give him the power to decree who is the owner of what. For all that, the sovereign may act iniquitously in the sense that he allows his own appetites and interests to count for more than those of anyone else, and so makes himself, for selfish reasons, the owner of more land than anyone else. There is a law of nature against iniquity, and therefore a law that decrees that the sovereign has to *try* to be equitable. But efforts are one thing; actual behaviour is another. The law of nature is not binding on the sovereign's behaviour, since he retains the right of nature and is authoritative about what to do for the best. If, in his opinion, it is for the best to behave iniquitously, then no other free agent, still less one of his subjects, can blame him for behaving accordingly. But the fact that his iniquitous acts are in this sense blameless does not mean that they are wise. If appropriating everyone's land makes people rebellious, albeit unjustly rebellious, then appropriating other people's land may have greater costs than benefits: it is subversive of the sovereign's power, which depends on the willingness of others to obey him.

Regarding the practice of religion, the relationship between church and state is a central preoccupation of *Leviathan*. Hobbes insists there that it is for the sovereign to decide whether people can join together for purposes of worship - that is, whether a given church can lawfully exist in the commonwealth. And he appears not to have been in favour of the establishment of a plurality of churches:

> But seeing a Common-wealth is but one Person, it ought also to exhibite to God but one Worship; which then it doth, when it commandeth it to be exhibited by Private men, Publiquely. And this is Publique Worship; the property whereof, is to be *Uniforme*: For those actions that are done differently, by different men, cannot be said to be a Publique Worship. And therefore, where many sorts of Worship be allowed, proceeding from the different Religions of Private men, it cannot be said there is any Publique Worship, nor that the Commonwealth is of any Religion at all.

(Hobbes [1651] 1839 III: 354)

He goes on to say that 'whereas there be an infinite number of Actions and Gestures, of an indifferent nature; such of them as the Common-wealth shall ordain to be Publiquely and Universally in use, as signes of Honour, and part of Gods Worship, are to be taken and used for such by the Subjects'. It is hard to gather from these passages even tacit approval for a pluralistic form of national religious life. On the contrary, it is strongly implied that unless all members of the commonwealth worship in the same way, it will be doubtful not merely which religion the commonwealth observes but whether it observes any. It is as if Hobbes thinks that in a babble of different religious rites there will be no clear sign of honour from the commonwealth to God. For a clear signal to be sent, the same thing must be transmitted by everyone in the commonwealth. This 'clear-signal' justification for uniformity is not as anti-tolerationist as a justification that holds that all but the appointed religious rites are idolatrous, but it lends support all the same to a highly restrictive form of public religious worship.

As chapter 12 of *Leviathan* shows, Hobbes was aware that people living together but worshipping differently could ridicule or belittle one another's ceremonies and come into conflict. This is another reason for the secular authority to regulate public worship. It is also a reason for worshippers to take religious ceremony out of the public arena altogether, and preserve their differences in private. Hobbes has no quarrel with this sort of privatization of religious practice, so long as it is thoroughgoing: driving it out of the public arena means driving it well out. To obviate regulation, worship must be not only be private (that is, practised openly by a private person) but practised by a private person in secret. As Hobbes says in chapter 31 of *Leviathan*, private worship 'when secret, is Free; but in the sight of the multitude, it is never without some restraint, either from the Laws, or the opinion of men, which is contrary to the nature of Liberty'.

Not only actions required by religious rites can be driven underground if they might disturb the peace; freedom of action in matters indifferent to religion can also be open to regulation, as chapter 31 of *Leviathan* makes clear. Arguably it is indifferent whether prayers are said in Latin or in English; arguably it is indifferent whether services are conducted by married or by celibate men; but notoriously, these are things that people look askance at or insist upon, and about which they can come to blows. For this reason, if for no other, there is a reason for the sovereign to declare what the language shall be, and who shall preside at services.

What is in the sight of the multitude and in the control of the religious is one thing; what is out of sight and uncontrollable is another: 'Internal faith is in its own nature invisible, and consequently exempted from all humane jurisdiction', Hobbes says in chapter 42 of *Leviathan*. Humane jurisdiction is not just secular jurisdiction, but also that of a body charged by a church with the inquisition of believers. Beliefs in general are not subject to the will he says in *De Politico Corpore*, a pirated edition of part two of the *Elements of Law* (1839 IV: 339). And although salvation depends on believing some things and not others, it is hard to be sure which things have to be believed beyond an uncontroversial minimum. For all of these reasons Hobbes is against the policing of religious belief, and against preferment for any one creed. It is in connection with the policing of belief rather than religious practice that his views come close to those of Independents, who in seventeenth-century England favoured a relatively loose, relatively tolerant organization of religious life, in particular a life outside a unitary Church of England. For when he appears in *Leviathan* (chapter 47) to side with the Independents in the Primitive church it is over each person deciding whose preaching to follow, not over many different religions being openly practised ([1651] 1839 III: 695). And in countenancing a variety of religious persuasions Hobbes is not so much showing tolerance as denying the importance to civil order of what goes on below the threshold of visible action.

8 Problems with Hobbes' political theory

In order to legitimize the powers of sovereigns, Hobbes invites his readers to think of sovereigns and states as the creations of free, self-interested people. The condition of subjection to a sovereign, even if it is not entered into by an original contract, can nevertheless be freely endorsed by each subject, since there is a good argument from self-interest for the condition. The argument says that the alternative to subjection is a dangerous chaos, which is infinitely worse than an intrusive but protective civil power. This is the argument directed against people who are already subjects; is the same argument effective when directed at people who do not yet belong to a state, who are in a state of nature? The issue can be sharpened by pointing out that the process of trading the state of nature for the commonwealth involves each person giving something now for the sake of a benefit later. Each person agrees to lay down their right of nature if everyone else will do likewise for the sake of peace. Granting that the condition of peace is better for each than the condition of war, is it not even better for anyone who can get away with it, to

retain their right of nature while others give away theirs? Is it not better to pretend to lay down that right and then to take advantage of those who genuinely do so? If the answer to this question is ‘Yes’, how can the best outcome, from the point of self-interest, be one in which everyone performs and lays down their right of nature?

The question is taken up in a famous passage in chapter 15 of *Leviathan* where Hobbes replies to the fool who pretends that there is no such thing as justice. Commentators have likened it to the question posed by ‘prisoners’ dilemmas’ where, for example, the outcome that would be best for each of two prisoners is for the other to confess and solely take a punishment for a crime, but where it turns out to be rational for each to confess and receive a punishment less severe than the maximum. The question is how this ‘lesser’ outcome can be the better one. In the case of the opportunistic non-performer of covenants discussed by Hobbes, the answer is that there is more security in the performance than in the non-performance of covenants. Someone who takes advantage of another’s laying down the right of nature can only do so once and expect to get away with it. And the temporary advantage they gain may in any case not counterbalance what they will lose by being opposed by all those whose trust is threatened or betrayed.

Another problem with Hobbes’ theory turns on the supposed moral urgency of each person’s laying down the right of nature. Hobbes thinks that the biggest threat to the stability of states is the existence of too much scope for private judgment. The more each person is entitled to think for themselves in matters of wellbeing, the worse it turns out for everyone. This implication is supported in Hobbes’ theory by a supposedly scientific understanding of the diversity of the passions and the way that the passions get the better of judgment in human beings. By delegating their power of judgment to someone who is not affected by the individual passions of the people ruled over, people actually get access to a more effective (because more dispassionate) means of securing themselves than their own individual judgments. But, by the same token, they forgo any intellectual contribution to public life. They do not contribute to the state as citizens but as subjects only: political life for the many consists solely of submission to law. It is by their passivity rather than by the application of their powers of judgment that people promote the public good. This may have seemed persuasive in a time when the Biblical example of Adam and Eve would have been widely understood to illustrate the dangers of private judgment of good and evil, but to contemporary sensibility it verges on the paranoid. In fact, Hobbes’ point is not quite that the judgments of human beings about their wellbeing can never be trusted, but rather that their *prescientific* judgments cannot be trusted. Prescientifically, people are moved by their feelings of pleasure and displeasure to call things ‘good’ and ‘bad’ - few have either the resources or the circumstances to be taught any better. But there is a better conception to be inculcated: Hobbes indicates that it consists of showing how things that are genuinely good, as opposed to pleasant, promote peace or self-preservation, while things that are genuinely bad, as opposed to unpleasant, are conducive to war and self-destruction.

9 The scientific status of Hobbes’ ethics and politics

The main lines of Hobbes’ political philosophy include the idea that the commonwealth is a solution to the ever-present threat of war in the passionate make-up of human beings, and that the commonwealth is made by delegating the right of nature to a sovereign power with unlimited power. This summarizes a theory worked out in very great detail, a theory Hobbes always regarded as ushering in the scientific treatment of morals and politics. What made the theory scientific? A number of answers get support from Hobbes’ writings. The scientific status of politics is sometimes said to be owed to its derivation, in some sense, from Hobbes’ natural science. Again, Hobbes’ use in civil philosophy of a method applicable to natural bodies and bodies politic alike is sometimes thought to be crucial to its scientific status. These answers are consistent with some texts but sit uneasily with others. First, although Hobbes thought that there was a way of approaching the principles of morals and politics from a starting point in the workings of sense and imagination (which were treated of by physics), he consistently denied that civil science *had* to be approached by way of physics. In chapter 6 of *De corpore* he says that people entirely innocent of physics, but who enjoy introspective access to their own passionate states, are able to see in themselves evidence for the truth of the theory of human nature in the civil science. Something similar is said in the Introduction to *Leviathan*. In the same vein there is the explanation of his having been able to publish *De cive*, the third volume in his trilogy, without having first expounded the principles of parts of philosophy that were prior to politics. Hobbes said that this was possible because civil philosophy depended on principles of its own. What ties together all of these remarks is a belief in the autonomy of civil science, a belief that is not seriously called into question by his saying that the two principal parts of civil philosophy were alike in applying a certain sort of

method to the investigation of bodies - bodies politic on the one hand and natural bodies on the other.

When Hobbes says that each part of philosophy deals with bodies, he makes clear that the two kinds of bodies are 'very different' from one another. And there is no evidence that 'body', when applied in the phrase 'body politic', is supposed to mean 'space-occupying thing existing without the mind'. In other words, there is no evidence that bodies politic are bodies in any more than a metaphorical sense. Finally, it is not clear that Hobbes thought that the scientific status of his politics was made more credible by an analogy between bodies politic and natural bodies. It is not as if he thought that natural bodies were well-understood scientifically, and that bodies politic might in principle be as well understood if the methods of physics were applied to them. On the contrary, Hobbes always thought that the properties of human artefacts, such as bodies politic, were much better understood than the properties of natural bodies, which had God's inscrutable will behind them.

It would be a mistake, however, to think that civil science for Hobbes was primarily an exercise in the investigation of the properties of bodies. It was an exercise in putting our judgments about what we ought to do on grounds that were far more solid than pleasure and pain. Good and bad were a matter of what conduced or interfered with self-preservation or peace, not how it felt to do or get this or that. The core of Hobbes' civil science is an attempt to recast the precepts of morality - the laws of nature - as instruments of peace, and to show how the ingredients of war are latent in any project for the pursuit of happiness. The scientific status of the doctrine of the laws of nature - the ground of its claim to be called moral philosophy - was its conforming to the pattern of a deductive system, based on two fundamental laws of nature and the rest derivative. Similarly with the deduction of the rights of sovereigns from the goal of peace. The scientific status of the argument for the inevitability of war consisted in its proceeding from principles about the passions. But these principles were by no means the property of physics or physicists; they were available in each person's introspective self-knowledge.

TOM SORELL

List of works

A new edition of Hobbes' works is currently in preparation. Until it is complete, the standard edition will remain that of Sir William Molesworth, which omits many manuscripts and a great deal of Hobbes' correspondence.

Hobbes, T. (1839) *The English Works of Thomas Hobbes*, ed. W. Molesworth, London: John Bohn, 11 vols.(The spelling and punctuation are modernized in this collection.)

Hobbes, T. (1845) *Opera Latina*, London: John Bohn, 5 vols.(Hobbes' works in Latin.)

Hobbes, T. (1628) *Thucydides' History of the Pelopennesian Wars*; repr. ed. R. Schlatter, New Brunswick, NJ: Rutgers University Press, 1975.(The Petition of Right of 1628 may have led to the publication of this translation.)

Hobbes, T. (1630?) *The Short Tract*, in *The Elements of Law Natural and Politic*, ed. F. Tonnies, London: Simpkin & Marshall, 1889.(This work, which appears as Appendix I, is attributed by Tonnies to Hobbes.)

Hobbes, T. (1640) *The Elements of Law Natural and Politic*, ed. F. Tonnies, London: Simpkin & Marshall, 1889. (The correct and intact edition of material also reproduced as *Human Nature* and *De Corpore Politico* in Molesworth, volume 4.)

Hobbes, T. (1641) *The Third Set of Objections to Descartes Meditations*, in *The Philosophical Writings of Descartes*, vol. 2, trans. J. Cottingham, R. Stoothoff and D. Murdoch, Cambridge: Cambridge University Press, 1985.(Hobbes wrote these objections as a member of Mersenne's circle in Paris.)

Hobbes, T. (1642) *De cive*, in *The English Works of Thomas Hobbes*, vol. 2, ed. W. Molesworth, London: John Bohn, 1839.(Molesworth follows an English translation, not by Hobbes, of the original Latin.)

Hobbes, T. (1643) *Thomas White's De Mundo Examined*, trans. H Jones, Bradford: Bradford University Press, 1976.(A recently discovered early foray into metaphysics.)

Hobbes, T. (1646) *A Minute or First Draught of the Optiques*.(The most polished of Hobbes' optical treaties)

Hobbes, T. (1651) *Leviathan, or the Matter, Form and Power of Commonwealth, Ecclesiastical and Civil*, in *The English Works of Thomas Hobbes*, vol. 3, ed. W. Molesworth, London: John Bohn, 1839; repr. ed. R. Tuck, Cambridge: Cambridge University Press, 1991; repr. ed. E. Curley, Chicago, IL: Hackett Publishing Company, 1994.(Hobbes' masterpiece.)

Hobbes, T. (1654) *Of Liberty and Necessity*, in *The English Works of Thomas Hobbes*, vol. 4, ed. W. Molesworth, London: John Bohn, 1839.(Classic discussion of freedom and determinism.)

Hobbes, T. (1655) *De corpore*, in *The English Works of Thomas Hobbes*, vol. 1, ed. W. Molesworth, London:

John Bohn, 1839.(Follows an English translation of 1656.)

Hobbes, T. (1656a) *The Questions concerning Liberty, Necessity and Chance, Clearly Stated and Debated between Dr Bramhall, Bishop of Derry, and Thomas Hobbes of Malmesbury*, in *The English Works of Thomas Hobbes,* vol. 4, ed. W. Molesworth, London: John Bohn, 1839.(Bramhall had accused Hobbes of atheism and irreligion.)

Hobbes, T. (1656b) *Six Lessons to the Professors of Mathematics… in the University of Oxford*, in *The English Works of Thomas Hobbes*, vol. 7, ed. W. Molesworth, London: John Bohn, 1839.(Testy reply to some Oxford antagonists.)

Hobbes, T. (1658) *De homine*; trans. and abridged B. Gert, T. Scott-Craig and C.T. Wood as *On Man*, in *Man and Citizen*, New York: Humanities Press, 1972.(A complete translation of *De homine* is in preparation at Cambridge University Press.)

Hobbes, T. (1668) *Behemoth, or the Long Parliament, Dialogue of the Civil Wars of England*, in *The English Works of Thomas Hobbes*, vol. 6, ed. W. Molesworth, London: John Bohn, 1839.(Hobbes' own history of the English Civil War.)

Hobbes, T. (1678) *Decameron Physiologicum*, in *The English Works of Thomas Hobbes*, vol. 7, ed. W. Molesworth, London: John Bohn, 1839.(Restates some of the methodology and principal results of the physical sections of *De corpore*.)

Hobbes, T. (1681) *Dialogue between a Philosopher and a Student of the Common Laws of England*, in *The English Works of Thomas Hobbes*, vol. 6, ed. W. Molesworth, London: John Bohn, 1839.(A discussion of political philosophy.)

Hohfeld, Wesley Newcomb (1879-1918)

W.N. Hohfeld, US law professor and proponent of analytical jurisprudence, was responsible for one of the most influential analyses of the concept of a right in legal and moral philosophy. He offered to resolve all complex legal relations into a few simple and elementary ones, often confusedly referred to as 'rights'.

For Hohfeld, 'right' in its strict sense necessarily correlates with an identical duty owed by a second party. Rights differ from 'privileges' (where a person is not duty-bound), from 'powers' (where a person is legally enabled to bring about change in some legal relationship) and from 'immunities' (where a person is legally protected from another person's purported exercise of legal power designed to effect some change in a given legal relationship).

Hohfeld constructs two sets of interrelated 'correlatives' and 'opposites'. The first set comprises 'right' or 'claim' (sometimes 'claim-right' in the subsequent literature), with its correlative 'duty' and its opposite 'no-right'; 'privilege' (or, preferably according to most commentators, 'liberty') is in turn the opposite of duty and the correlative of no-right. These always concern some action or abstention by a person. One has a duty to act, for example, to make a payment, for another; then, correlatively, that other has a (claim-)right to the payment. The opposite would be if the second party had no right to be paid by the first - and in that case the first would be at liberty to, or would have the privilege to, withhold payment.

The second set concerns power and its correlative 'liability' and opposite 'disability'. Legal power always refers to some legal relationship, for example, a contractual right of A to some payment by B. In this case, the law may enable A in some way to vary the existing legal relationship, for example by voluntarily renouncing right to payment. Then B has as correlative the liability to have the privilege of non-payment conferred on them by A. In the opposite case, we consider the possibility of an absence of power. For example, B normally lacks power to revoke unilaterally A's contractual right. B thus has a 'disability' to bring about this change; A correlatively enjoys an immunity from it.

Notable in this analysis is the atomistic character of each legal relationship; everything is brought down to single relationships of distinct persons in respect of specific actions or abstentions, or particular (purported) power-exercising acts. Hohfeld indeed argues that more complex situations, such as those we encounter in property-ownership or in corporate relations, are resolvable without residue into aggregate sets of simple atomic relationships belonging to his categories; hence his claim that these are the 'fundamental' legal conceptions. This claim has been challenged, and along with it the claim that Hohfeld's analysis merely clarifies or purifies existing legal usages; Hohfeld was more a reformer than an analyst of current legal usage. For those purposes for which it is useful exhaustively to investigate the totality of relations between single individuals for some legal purpose, the analysis provides a valuable tool. But it is less valuable for other purposes, such as elaborating a catalogue of fundamental human or constitutional rights, or constructing a theory of property.

White, A.R. (1984) *Rights*, Oxford: Clarendon Press.(Contains a root-and-branch critique of Hohfeld and those who have been tempted to follow his doctrines, written in the spirit of linguistic-analytical philosophy.)

Holcot, Robert (*c*.1290-1349)

Earlier scholars labelled Robert Holcot a sceptic, a nominalist and an Ockhamist. In fact, the work of this English Dominican friar is too complex and original for any simple label. What can be said with justice is that Holcot belongs among philosophers who work not at developing their own systematic philosophies but at criticizing the speculative efforts of their predecessors. Holcot questions the scope of Aristotelian logic, the extent of theological knowledge and even the extent to which we can have knowledge of the world around us.

Holcot studied theology at Oxford, delivering his commentary on Peter Lombard's *Sentences* over two academic years there, beginning probably in 1331. This was a fruitful period for philosophical theology at Oxford. Holcot's lectures overlapped with those of William Crathorn, a fellow Dominican but nevertheless a fierce rival, and the influential Franciscan Adam Wodeham. Holcot himself was highly influential, and his biblical commentaries, especially his commentary on the Book of Wisdom, were widely circulated throughout the later Middle Ages and beyond.

Besides the works just mentioned, Holcot also composed a series of quodlibetal questions. The first of these quodlibets is an ideal introduction to Holcot's philosophical views. In it he asks whether theology is a science. His surprising answer is that it is not, or at least not one we can naturally acquire in this life. He means that there are no theological truths we can know naturally with the sort of certainty required for *scientia*; that is, no theological truths are demonstrable (by us, on our own, in this life). First and foremost, we cannot demonstrate that God exists; cosmological arguments rest on contingent facts that are not themselves demonstrable. Moreover, to prove God's existence, one must prove the existence of a thing that satisfies all the articles of the faith: this God must be shown to be infinite, triune, the creator, and so on (see God, arguments for the existence of). Anselm's ontological argument comes in for careful criticism at this point because it takes off from a richer conception of God, one from which many divine attributes might be derived.

In this quodlibet, Holcot notes rather casually that he would extend these claims to all incorporeal things, including the human soul. There is therefore no science of the human soul, and (presumably) we cannot demonstrate even that we have souls. Holcot's discussion of God's causal powers suggests even more strongly that he is a thoroughgoing sceptic. There he acknowledges (as it seems any Christian philosopher must) that God can intervene in the natural order, causing fire to stop giving heat or, as he luridly puts it, causing the entire structure of the world to take on the appearance of a fly. Such possibilities lead Holcot to claim that there is always an element of uncertainty in our empirical beliefs, and in his commentary on the *Sentences* he goes on to conclude that there can be no *scientia* regarding them.

Much has been made of these claims, and if *scientia* is translated as 'knowledge' then Holcot appears to be a quite radical sceptic. However, his position is more subtle than this. The remainder of his argument makes it clear that Holcot does not believe our empirical beliefs lack all warrant: 'It is sufficiently established [*persuasum*], to me, that God has not made such alterations' (*In quatuor libros Sententiarum* IV q.3 ad1); 'that A is the cause of B is held with probability' (*Determinationes* 3). From the fact that such beliefs are not held with complete certainty, we cannot infer that they should not be held at all, and Holcot insists that we have good reasons for believing as we do about the world. He does not go on to ask the questions a modern reader would like to have answered, such as what exactly those good reasons are and whether such beliefs can still count as knowledge. Nevertheless, Holcot is clearly not entirely the thoroughgoing sceptic he might seem to be.

Relatively little of Holcot's work is concerned with establishing the limits of *scientia*. Indeed, he argues in his first quodlibet that theology is still very much worth studying, even if it is not a science, because through it we can acquire a stronger, broader and more explicit faith. True to his words, Holcot involves himself in a wide range of theological and philosophical controversies. One of his more distinctive claims, and one with far-ranging implications, is his rejection of any sort of metaphysical distinction other than a 'real' distinction. This point receives special attention in his discussion of the divine perfections and the Trinity. Following William of Ockham and John Duns Scotus, Holcot rejects out of hand the suggestion of Thomas Aquinas that conceptual distinctions (distinctions 'of reason') account for the differences between, for example, divine wisdom and divine goodness. However, Holcot also rejected the proposals of Scotus and Ockham, each of whom in his own way analysed the

divine essence in terms of ‘formal’ distinctions. ‘All that are formally distinct are distinct things,’ Holcot charges (*Determinationes* 10). By rejecting all non-real distinctions, Holcot places himself in a difficult position as regards the Trinity (see Trinity). Church doctrine was very clear in rejecting any real distinction among the divine Persons, and so Holcot was committed to saying that there are no distinctions at all within the Trinity. If so, however, then the following syllogism should be valid: ‘The Divine Essence is the Father, and the Divine Essence is the Son; therefore, the Son is the Father.’ This syllogism is not valid: the premises are true and the conclusion false. The threat that looms, then, is that Aristotle’s ‘entire syllogistic form would be defective’ (*Determinationes* 10). Holcot’s reply is to claim that Aristotelian logic is not universally applicable: ‘the logic of the faith has to be different from natural logic’ (*In quatuor libros Sententiarum* I q.5, ad1). However, this striking pronouncement, once developed, turns out to be less interesting than it sounds. Holcot does not offer anything like an alternative logic: what he gives us instead are fairly obvious rules for excluding terms that stand for ‘many things and also each one of them’ (*Determinationes* 10), a restriction that rules out terms that stand for God.

Hölderlin, Johann Christian Friedrich (1770-1843)

An outstanding German poet, Hölderlin is now widely recognized as one of the most important writers and thinkers of his time. After an initial period of critical neglect and relative public indifference, he eventually came to enjoy a privileged status in German cultural life at the beginning of the twentieth century, and has continued to exercise a profound influence on modern literature and critical thought. Hölderlin's work emerged within the context of Kant's Critical Revolution and developed in constant interaction with the German Idealist speculation this subsequently provoked, against the background of the French Revolution and the fundamental issues raised in its wake for an entire generation. Hölderlin was personally acquainted with many of the leading figures of the period, including Schiller, Goethe, Herder, Novalis, Fichte, Schelling and Hegel. His writings reflect and respond to many of the central philosophical concerns and themes of his time, in a highly original and prescient fashion. However, it is only since Wilhelm Dilthey that the importance of his specific influence on the intellectual development of Schelling and Hegel in particular has been fully recognized, so that he has even been described as the 'Doctor Seraphicus' of German Idealism. His work subsequently provided a frequent point of reference for the Frankfurt School's engagement with the heritage of German Idealism and the problem of the relationship between aesthetics, ethics and politics. More recently, Hölderlin has become a major presence in much contemporary critical and deconstructive theory, largely through the pervasive influence of Martin Heidegger.

1 Life and writings

Hölderlin grew up in a sheltered, intensely Pietist domestic environment. His mother directed his education towards a career in the ministry, a later source of much psychological conflict since he never subsequently gained the financial independence necessary to pursue his chosen literary career. In 1788 Hölderlin entered the Tübingen Stift, ostensibly to study theology, but was soon preoccupied with developments in contemporary literature and philosophy, and the beginnings of the French Revolution. He shed his earlier orthodox religious beliefs under the influence of Kant and the classicizing humanism of Friedrich Schiller, and became friends with his fellow-students Schelling and Hegel. His early poetry celebrated humanistic ideals using a rhyming, hymnic style indebted largely to Schiller. Hölderlin encapsulated his central interests at this time: 'Kant and the Greeks are my only reading' (1946-85 vol. 6: 128). His attempts to mediate his Graecophile enthusiasm with the rigorous republicanism of Fichte, and with the latter's radicalization of Kantian ethics, is documented in the mid 1790s through the various evolving versions of his first major work, the novel *Hyperion* (1798-9).

Almost alone among his writings *Hyperion* enjoyed a certain celebrity in Hölderlin's lifetime, becoming something of a 'sentimental' classic, not entirely unlike Goethe's *Werther*, by which it was probably influenced. Set in the contemporary context of the Greek struggle for national independence, the structure of the first-person epistolary narrative presents the spiritual evolution of its idealistic eponymous protagonist, combining the personal theme of transforming love with broader concerns for the nature of genuine political freedom. The hero moves from an initial pantheistic identification with the totality of life, through painful but educative experiences of failure and disappointment with a recalcitrant human reality, towards a more mediated and differentiated relationship between self and world. *Hyperion* contains numerous allusions to contemporary debates concerning the possibilities of revolutionary social transformation and the appropriate means for its realization. But the narrator also undergoes a process of personal transformation in the act of narration itself, culminating in an emancipatory vision of what it means to become an artist dedicated to the projection of a human future free of despotic coercion. The lyrical, poetic prose celebrates a religio-aesthetic conception of the world as an intrinsically harmonious totality that requires no external theological legitimization, and recognizes the experience of mortality and finitude as a necessary moment of the life of the whole, concluding upon a prospective rather than a resigned note of chastened aspiration.

Hölderlin's next major project, a tragedy on the death of Empedocles, continued and deepened many of these central themes. Hölderlin never brought the play to a satisfactory conclusion, but three fragmentary versions survive, together with an exceedingly compressed and obscure related prose study known as the *Grund zum Empedokles (The Groundplan of Empedocles)*, all composed between 1797 and 1799. Here, too, he concerns himself with the possibility of revolution and the necessity of an accompanying moral-spiritual reformation. But a newer note is also struck through emphasis upon the theme of tragic hubris on the part of the protagonist, and the

poet's increasing concern with the dangers of human identification with the divine - the seductions of pantheism - and the concomitant tendency to exalt human power in a unilaterally dominating relationship with the natural world and other human beings. This arguably represents an incipient critique of the 'Promethean' tendencies of Fichtean idealism and its subordination of nature as object to the subject as free power of total self-determination. None the less, Hölderlin equally emphasizes the importance of 'maturity' and autonomy in the Kantian sense if the potentially authoritarian excesses of revolutionary despotism are to be avoided. If Hölderlin originally conceived his drama as a contribution to contemporary political enlightenment and an encouragement to social renewal, it is unsurprising that he finally abandoned work on it when Napoleon became First Consul in 1799 and the hopes of a peaceful 'German' Revolution receded dramatically.

In the poetry written between 1800 and his apparent mental collapse in 1806, Hölderlin turned increasingly to more explicit engagement with the decisive actualities of European history, particularly the ambivalent relationship between the classical heritage and the claims of the Christian tradition. The implicit and semi-secularized eschatological dimension of Hölderlin's thought now comes insistently to the fore, and he concentrates upon the aporias of the poet's proclamation in a barren age characterized by a thankless and essentially instrumental attitude to the world. The concern with preserving a sense of proper limitation is reflected in the constant reference to 'mortals' and the powerful apocalyptic tone of the final hymns. After his breakdown (arguably exacerbated if not actually precipitated by drastic contemporary 'treatment') Hölderlin was taken under benevolent care until his death. In this last phase he reverted to a more detached and naïve style of composition in which the tensions and problems of his earlier life and work seem fictively resolved and dissolved into an eerie catatonic calm.

2 Fundamental themes

If poetry is 'made of words not ideas', there is an obvious danger in abstracting selected themes from their complex aesthetic context. But Hölderlin 's work articulates rather than illustrates a developing and penetrating body of coherent concerns and a distinctive mode of spiritual perception. In the first instance, it aesthetically prefigures a comprehensive reconciliation of the great polarities and disabling dualisms bequeathed by Kantian thought, principally the bifurcation between subject and object, spirit and nature. Yet the anti-identitarian, literally 'anti-monarchical', moment of Hölderlin's thought also resists the institution of a single controlling principle, that would suppress diversity and differentiation, in favour of an ontology of reciprocal interaction (1946-85 vol. 6: 300-1). The rehabilitation of finitude and fragility, of an acknowledged interdependence of subject and object, art and nature, is typically connected with an ethics of gratitude that is more than an ideology of subservience or deference. Many poems express the thought of an intrinsic dependency of the 'divine' dimension upon the sphere of mortal experience if it is to find fulfilment through an appropriate human 'correspondence' which constitutes neither an identity nor an antithesis. Despite the repudiation of a traditional metaphysical concept of an infinite creator-God independent of the created world, there remains a permanent 'theological' residue, a sublimated Christian element, in Hölderlin's recognition of our inherent 'creatureliness' within the economy of nature, our privileged vocation as the finite site for the self-manifestation and self-enjoyment of life through the indispensable, cultivating addition of human 'art' (1946-85 vol. 6: 326-30). Perhaps Hölderlin's most lasting significance lies in this powerful utopian vision of reconciled dwelling, rooted in a conception of art as liberating praxis that has only become central in our own time. This work is less a unique subjective and personal expression - though it is also that - than a compelling articulation of universal human aspirations for a transformed relationship to inner and outer nature. Aesthetic formalist tendencies can arguably do little justice to work which 'aesthetically' questions the supposed 'autonomy of the aesthetic' as a subjective and sequestered sphere of private experience, and implicitly challenges some of our most cherished modern philosophical assumptions.

Holism and individualism in history and social science

Methodological individualists such as Mill, Weber, Schumpeter, Popper, Hayek and Elster argue that all social facts must be explained wholly and exhaustively in terms of the actions, beliefs and desires of individuals. On the other hand, methodological holists, such as Durkheim and Marx, tend in their explanations to bypass individual action. Within this debate, better arguments exist for the view that explanations of social phenomena without the beliefs and desires of agents are deficient. If this is so, individualists appear to have a distinct edge over their adversaries. Indeed, a consensus exists among philosophers and social scientists that holism is implausible or false and individualism, when carefully formulated, is trivially true.

Holists challenge this consensus by first arguing that caricatured formulations of holism that ignore human action must be set aside. They then ask us to re-examine the nature of human action. Action is distinguished from mere behaviour by its intentional character. This much is uncontested between individualists and holists. But against the individualist contention that intentions exist as only psychological states in the heads of individuals, the holist argues that they also lie directly embedded in irreducible social practices, and that the identification of any intention is impossible without examining the social context within which agents think and act. Holists find nothing wrong with the need to unravel the motivations of individuals, but they contend that these motivations cannot be individuated without appeal to the wider beliefs and practices of the community. For instance, the acquiescence of oppressed workers may take the form not of total submission but subtle negotiation that yields them sub-optimal benefits. Insensitivity to social context may blind us to this. Besides, it is not a matter of individual beliefs and preferences that this strategy is adopted. That decisions are taken by subtle strategies of negotiation rather than by explicit bargaining, deployment of force or use of high moral principles is a matter of social practice irreducible to the conscious action of individuals.

Two conclusions follow if the holist claim is true. First, that a reference to a social entity is inescapable even when social facts are explained in terms of individual actions, because of the necessary presence of a social ingredient in all individual intentions and actions. Second, a reference to individual actions is not even necessary when social facts are explained or understood in terms of social practices. Thus, the individualist view that explanation in social science must rely wholly and exhaustively on individual entities is hotly contested and is not as uncontroversial or trivial as it appears.

1 Introduction

Several commentators have noted the extraordinarily muddled character of the debate that ensued in the 1950s between individualists and holists. Why this has been so is one of the enigmas of social science. The main issue was repeatedly derailed, peripheral issues were given singular pre-eminence, different versions of the doctrine remained entangled, and deeper philosophical issues in the philosophy of science were never adequately probed. What is worse, both sides persistently knocked down the weakest, most caricatured formulation of the opponent’s views. Retrospectively, the battle does give the appearance of possessing a large element of sham. No wonder then that when the dust settled, many of the issues that once provoked so much controversy were resolved; motivated prejudice against the other was acknowledged, and soon, more concessive versions, plainly indistinguishable from each other, were formulated. A careful analysis of the debate can identify points of agreement between the two and, more importantly, that something significant and contentious between the two sides persists, therefore the battle is likely to rage in the future. This shall be demonstrated by first unearthing the principal assumptions of individualism and then showing that they can be challenged from a non-individualist viewpoint.

Any further exploration of the subject must begin with a warning: it is unwise to be tempted by the view that a worthy political cause or great moral ideal is at stake in contending methodologies. The passion that Popper (1960) and Hayek brought into the debate immobilized it rather than provided the fresh impetus it badly needed. On this point Schumpeter was right: an advocacy of methodological individualism entails no commitment to liberalism. Likewise, opposing it does not imply abandoning political liberalism or denying the moral value of the individual. So it is not just that methodological individualism should not be confused with political, moral or religious individualism but, more importantly, it must not be seen automatically to enlist itself behind any of them.

It is equally important to remind ourselves that the term ‘methodological’ must be understood here in the broadest

sense possible to include at least three distinct but related ingredients. The first, epistemological, concerns the understanding and explanation of social and individual entities. The second, ontological, turns on whether or not social entities are anything beyond a collection of individual entities. The third, semantics, is about the meaning of words: can a term referring to a social entity be analysed without remainder into terms that refer only to individual entities? The literature on the subject abounds with attempts to turn methodological individualism and holism into purely explanatory doctrines, but disputes over the relevant type of explanatory variable or over correct explanatory form have frequently turned into sharp controversies on ontological and semantic matters. This is hardly surprising, because an explanatory doctrine presupposes or entails ontological and semantic commitments. Therefore, individualism and holism are best viewed as comprehensive strategies with all the three components mentioned above.

2 Ontological reasons

This much clarified, it must be noted that a particular dispute, over one form of semantic individualism, is entirely settled. There are no takers any more for a project inspired by logical constructionism recommending that every single term referring to social entities be analysed as a collection of individual terms. However, for individualists, this failure has no ontological or explanatory ramifications. Second, one ontological dispute must be set aside. Encouraged by careless formulations and deep misunderstanding, it was once thought that holists believed in supra-substances hovering over and above all individuals; that they were carrying forward the Cartesian legacy of substance-dualism by introducing yet another substance called the social. This is unfair to the holist who must be seen instead to be advocating property pluralism and emphasizing the distinctive causal efficacy of social properties.

We may compare this point with an issue in the natural sciences. Non-reductionists in biology often argue that biological organisms display teleological properties that are best understood as irreducible to but supervenient upon physical properties (see Supervenience). The principle of supervenience views the world as stratified, with properties at one level dependent for their existence in a non-causal way on properties lying at the more basic level. However, this relation of ontological dependence is non-reductive because the two sets of properties are never identical. Thus, teleological properties presuppose the existence of physical properties without being reducible to them.

It is in this sense that social properties are said to be supervenient on physical and biological ones. This much ought to be beyond dispute. What is not clear, however, is that this entails a supervenience of the social on the individual. For much depends on what we mean by the individual. If the term ‘individual’ refers to a single identifiable biological organism, then the statement is true. But surely, it is not the pure and abstract biological individual in focus here; rather what concerns us is the individual with distinctive human properties. The key question then is whether these distinctive human properties emerge only when individuals come together or if they already exist, independent of any relations between them. Similarly, it is fairly incontrovertible to claim that any social process is supervenient on the physio-biological movement of individual organisms. Durkheim, as good a non-individualist as any, said so much: ‘It is very true that society comprises no active force other than individuals’ (1982: 251). The holist argument contends only that the specific pattern of this dynamic process is not reducible to the movement of individual biological organisms taken aggregately (see further §5 below).

Another vital issue to register is this: the individualist/holist controversy is not identical to the structure/agency debate in the social sciences, for a number of reasons. First, individualism does not entail a commitment to free human agency. The individualist may believe agency to be restricted too, but locate all constraints on it within the individual psyche. Individualism is compatible with internal constraints and therefore with a full-blooded determinism. Second, it is simply false to assume that anything external to the individual agent is thereby constraining. External structures are not just constraining but also enabling. Indeed a robust view of free and active human agents is compatible with the claim that such capacities depend on the presence of relevant external structures. More importantly, individualists can develop not only a conception of internal but also of external constraints. They too can account for the very constitution of external structures, of rules, norms and conventions constraining human action. Likewise holists can develop a perfectly cogent account of free human action. If this is so, the principal dividing line between the two sides cannot be drawn at the level of free agency and external constraint.

This is not the dominant understanding of those engaged in this debate. Holists accused individualists of ignoring the relations of the individual to the larger social context. Individualists, on their part, blamed holists for treating individuals as mere cogs in the social wheel. One was charged with ultra-voluntarism, the other reproached for supra-determinism. At the end of a long and unsavoury controversy, however, each side realized what should have been obvious from the very start: that neither agency nor the context within which it occurs can be ignored.

Let us identify the points where agreement is undeniable. Holists do not believe in supra-individual, social substances. They emphasize social relations and their undeniable constraining effects. Individualists cannot fault these claims. Individualists, likewise, highlight human agency and show that societies consist in or are a result of people acting. Holists can hardly object to this. Furthermore, both accept that the social does not think; it is individuals who do the thinking. We appear then genuinely to arrive at a consensus on a set of statements so truistic that an explanatory strategy must be deemed mistaken if it fails to incorporate or is incompatible with it.

However, a plausible holist contention is that this agreement is at the price of an even greater intellectual muddle. The seemingly uncontroversial character of these statements obscures the fact that they are open to rival interpretations, one that antecedently shifts the entire balance in favour of the individualist and another which obdurately refuses to do so. The claim that individualism is trivially true may well be a rhetorical device that conceals deeper ontological and methodological issues that divide rival camps. All the dimensions of the debate are not unravelled unless another vital issue, forced upon us less by ontological than by epistemological reasons, is addressed. Sharp differences between holists and individualists are often believed to lie precisely at this point. Close analysis reveals, however, a thicker consensus on this issue. Contentious issues lurk in the background, despite this agreement.

3 Epistemological reasons

The correct move here would first be to identify the relevant explanatory form and then try and show it as ontologically neutral, usable by individualists and non-individualists alike. But contestants in the debate have not approached the issue in this way nor found it easy to identify the correct explanatory form. One reason for this is their insensitivity to another major controversy in social science, namely, the argument between naturalists and anti-naturalists. Each side has often assumed not only the absolute validity of their preferred model of scientific explanation but their monopoly over it. The second reason is the wholly opposite error of identifying the individualist/holist debate with the naturalist/anti-naturalist controversy, as if the settlement of the first dispute rests solely on the successful resolution of the second. By assuming that holism entails scientism and that therefore their victory flows automatically from the defeat of positivist naturalism, individualists such as Hayek (1973) have been prone to this mistake. Clearly, many individualists are no less dogmatic about the claim that human affairs must be studied strictly with the methods of natural science. Conversely, holists can be equally steadfast in their advocacy of a distinctive method for social science. So it is important to see both the relevance of the naturalist/non-naturalist dispute to the individualist/holist issue and not to identify them (see Naturalism in social science).

The other related difficulty is that the debate is conducted without disentangling different explanatory forms. We may begin by distinguishing five versions of individualist and holist explanatory strategies. Three of these deploy the deductive nomological model of explanation (see Explanation §2). The first attempts to explain particular social facts by deducing them from laws of individual action. The second, known as explanatory reduction, explains not particular social facts but social laws by deducing them from laws pertaining to individuals (see Reduction, problems of). Since this reduction is achieved with the help of bridge statements which in turn can take two forms, we obtain two forms of reductionist strategies. The first requiring correlatory laws may be called correlatory reduction; the second, requiring identity statements is called identity-reduction. Identity-reduction is also referred to as micro-reduction because here a macro-entity (the social) is identified with all the micro-entities (the individuals) that compose it.

The difference between each must be maintained because arguments that work against one kind of individualist strategy do not necessarily work against the other. For example, if laws are deemed essential for explanations, and if it is shown that only laws pertaining to individual action can be formulated, then the first non-reductionist deductive-nomological version of individualism is vindicated. Holism fails because no social laws exist to explain particular social facts. Mandelbaum believed precisely this to be the target of individualist attack and therefore

tried to establish the existence of social laws (1973). But an argument establishing social laws does not invalidate individualism because by deducing them from laws pertaining to individuals, one version of individualism is still exonerated. Similarly, showing the impossibility of correlatory laws does not defeat reductionist individualism because the absence of correlatory laws may indicate not the impossibility of reduction but the prior realization of a successful identity-reduction.

A large part of the debate has been traditionally obsessed with these issues. However, this intellectual effort may have been futile if laws pertaining to individuals do not exist. For all these strategies depend not just on the presence of social laws but on general laws concerning individuals. And it is doubtful if such laws of human action exist. Notice that the laws in question must capture the precise features individuating human action. The same entity when subsumed under other descriptions may indeed yield laws but these would be utterly irrelevant. Reductionists are not pursuing laws of physical movement or bodily behaviour. The laws they are after must refer to actions, and therefore, to the beliefs and desires of individuals. However, as Davidson has shown, precisely such strict laws that explain or predict mental phenomena are impossible to obtain (1980). If valid, this is a decisive argument against all deductive-nomological versions of individualism. To revive this aspect of the debate, one has either to defeat this argument or give a conception of laws different from the one normally accepted (see Explanation in history and social science §§1, 3).

Two conclusions may follow from this. First, that explanations in social science are not possible, and second, more importantly, that laws are not necessary for explanation. Therefore we may explore explanatory forms unconnected with the deductive-nomological model. Forms that do not rely on the deductive-nomological model are intentional explanation and intentional understanding. The first, without invoking general laws or theoretical syllogism, explains action by showing that the behaviour of individuals is guided by beliefs and desires (intentions). The second, intentional understanding stresses the pivotal significance of understanding the beliefs and desires of agents. These strategies can be combined to give one overarching model for social science in which the understanding of beliefs and desires go hand in hand with the explanation of action. In what follows, the term ‘intentional explanation’ refers to this model.

4 Individualist intentional explanation

The formal structure of intentional explanation is simple and, up to a point, relatively uncontroversial: *A* desires *X*; *A* believes that doing *Y* will get him *X*; *A* does *Y*. The action, *Y*, is explained by deducing it, via a practical syllogism, from the given beliefs and desires. A crucial feature of beliefs and desires, of all intentional states generally, is that they are directed towards a real or imaginary object and that therefore they have an intentional content. Since these states are complex and in large measure linguistically constituted, we may say that they possess a linguistic content or meaning. Their ascription always involves the use of a ‘that’-clause. For example, *A* does not just believe or desire; *A* believes that the world is menacing and ugly or desires that it be beautiful. Clearly, the individuation of beliefs and desires depends on the meaning of words in these clauses. This presupposes that we capture the oblique occurrence of these expressions, where the oblique occurrence of expression is one in which the substitution of coextensive expression affects the truth-value of the whole containing sentence. For example, if ‘water’ occurs obliquely in ‘*A* believes water to be the most refreshing drink in the world’, then replacing it with ‘H_2O’ will alter the truth-value of the whole sentence.

This feature of obliqueness of expressions is of great significance for intentional explanation. Actions are individuated by their appropriate description, the description under which agents subsume their behaviour. To grasp their perspective or point of view, we must get right the description of their beliefs and desires, and this depends in turn on getting hold of obliquely occurring expressions. Likewise, a situation on which agents hold a view plays no direct role in characterizing their mental states or actions; it contributes to the explanation of actions only as it occurs obliquely, mediated by their points of view. This much is uncontroversial. But contrary to appearance, this by itself does not lead to individualism. The individualist turn comes with the further ontological assumption that these intentional states exist internal to agents, only in their heads. The individualist interpretation appears even more invincible with the second assumption that the meaning of beliefs and desires, their content, is individuated wholly internally, without reference to the external environment of the agent. These Cartesian assumptions turn action into a wholly individualist entity, bolstering the individualist belief that if the correct explanatory form in the social science is intentional explanation, then it just has to imply a victory of the

individualist over the non-individualist.

5 The holist challenge

The widespread acceptance of these assumptions has generated the illusion of consensus. The holist challenge shatters it. It is levelled on two fronts, one at individualist theories of meaning, the other at individualist theories of action. Arguments developed by Putnam and Burge help reinvigorate a non-individualist theory of meaning. Here one begins by the standard disambiguation of meaning into (a) extension and (b) intension (see Sense and reference). Then one shows that traditional theories of meaning are characterized by two assumptions. First, that intension determines extension. This can mean many things but it means at the very least that it helps to fix extension. Also, that sameness of intension always entails sameness of extension. Let us call this the functional character of intension. The second is the ontological assumption, already mentioned, that intension is a psychological entity that exists in the heads of individuals. So, we possess in our heads mental entities or representations that fix extensions of terms.

Putnam's thought experiment about two different substances on earth and twin earth, identical in all respects but their chemical structure, involves a long and complicated argument the conclusion of which, on one possible interpretation, is this: that the functional and the ontological assumptions cannot both be true (1975). Since identical mental states refer to different extensions, we must abandon either the view that meaning is a psychological entity or the claim that intension determines extension. Arguably, Putnam offers sound reasons for dropping the first and retaining the second. In other words, if the conclusion forced by Putnam's thought experiment is true, we must infer that meaning is not a psychological entity in the head of individuals. What then is it? Several answers exist but perhaps the one that challenges the individualist most is the view that it is fixed by an interlocking system of beliefs and actions necessarily involving several individuals. If so, meaning is a social not an individual entity. A related argument developed by Burge shows first that a difference in extension also affects oblique occurrences in 'that'-clauses, and therefore, the contents of mental states, and second, that 'communal practice is a factor in fixing and interpreting the words and attitudes of a person' (1979: 85). In the individuation of beliefs we must refer not just to the internal environment of agents but also to their external context, particularly to relevant social practices. If meanings are inescapably social, then, given that beliefs are individuated by meanings, beliefs too are social, and further, given that beliefs are analytic to action, so are actions. We began by attempting to explain a social entity wholly and exclusively in terms of individual entities, namely actions, beliefs and desires, we now find that all these are inescapably social. A social fact is then explained by another social fact. Individualism is challenged quite fundamentally. Also, holists do not abandon intentional explanation; they give it a non-individualist interpretation. There is no necessary dispute between individualists and non-individualists over which explanatory form is suitable for human affairs.

So, this is the crux of the matter. For individualists, beliefs, desires, intentions and actions are intrinsically individual. This is implausible for the holist because the intention of one person already makes reference to the intention of another; beliefs, desires and actions are already social. But what of the individualist view wherein intentions exist as internal states in the heads of individuals? And what about the ontology of irreducible social practices? To answer this, the holist opens the second front of attack, this time on the traditional theory of action. Put simply, the individualist theory of action is the widely accepted causal view according to which action can be analysed into three components: behaviour, intentional states and the relation of causality that binds them (see Action §1). Action is behaviour caused by intentions. An alternative theory refuses to reduce action to anything more basic. Intentional states separate from behaviour do not exist; rather, agents intend something by their behaviour. On this view, intentions lie directly embedded in behaviour so that we see behaviour as action. Action then is a basic ability of human beings quite independent of the ability to form representations in their heads. The holist accepts this and asks us to go further. If intention can directly inhabit the bodily behaviour of one individual, it can also occupy the bodily behaviours of several individuals.

This ontological issue has consequences for explanatory strategy as well. First, the identification of beliefs and intentions of an individual, crucial for intentional explanation, requires sensitivity to the interlocking intentions of a community of agents. The perspective of the agent, the oblique expressions in which it is embedded, is still crucial but the holist holds no presumption that it is available only or completely to the agent. Second, a grasp of social practice is necessary to situate individual beliefs, desires and actions. This is less a function of mental

operations in individual heads and more of practical know-how. Without practical understanding, as anthropologists testify and as philosophers who have worked on problems of translation and cross-cultural understanding know only too well, intellectual effort, no matter how sincere, is puerile.

Holism: mental and semantic

Mental (or semantic) holism is the doctrine that the identity of a belief content (or the meaning of a sentence that expresses it) is determined by its place in the web of beliefs or sentences comprising a whole theory or group of theories. It can be contrasted with two other views: atomism and molecularism. Molecularism characterizes meaning and content in terms of relatively small parts *of the web in a way that allows many different theories to share those parts. For example, the meaning of 'chase' might be said by a molecularist to be 'try to catch'. Atomism characterizes meaning and content in terms of* none *of the web; it says that sentences and beliefs have meaning or content independently of their relations to other sentences or beliefs.*

One major motivation for holism has come from reflections on the natures of confirmation and learning. As Quine observed, claims about the world are confirmed not individually but only in conjunction with theories of which they are a part. And, typically, one cannot come to understand scientific claims without understanding a significant chunk of the theory of which they are a part. For example, in learning the Newtonian concepts of 'force', 'mass', 'kinetic energy' and 'momentum', one does not learn any definitions of these terms in terms that are understood beforehand, for there are no such definitions. Rather, these theoretical terms are all learned together in conjunction with procedures for solving problems.

The major problem with holism is that it threatens to make generalization in psychology virtually impossible. If the content of any state depends on all others, it would be extremely unlikely that any two believers would ever share a state with the same content. Moreover, holism would appear to conflict with our ordinary conception of reasoning. What sentences one accepts influences what one infers. If I accept a sentence and then later reject it, I thereby change the inferential role of that sentence, so the meaning of what I accept would not be the same as the meaning of what I later reject. But then it would be difficult to understand on this view how one could rationally - or even irrationally! - change one's mind. And agreement and translation are also problematic for much the same reason. Holists have responded (1) by proposing that we should think not in terms of 'same/different' meaning but in terms of a gradient of similarity of meaning, (2) by proposing 'two-factor' theories, or (3) by simply accepting the consequence that there is no real difference between changing meanings and changing beliefs.

1 The doctrines

Semantic holism is the view that the meaning of a sentence is determined by its place in the web of sentences comprising a whole theory. Mental holism is the corresponding view for belief content - that the identity of a belief content is determined by its place in the web of beliefs comprising a theory. Sometimes holists advocate a more sweeping view in which the identity of a belief is determined by its relations to a body of theories, or even *the whole of a person's belief system*. In what follows, mental and semantic holism are treated as two aspects of a single view.

Holism can be contrasted with two other views: molecularism and atomism. Molecularism characterizes meaning and content in terms of a relatively small part of the web that many different theories may share. For example, the meaning of 'bachelor' might be said by a molecularist to be 'man who has never married'. And the meaning of 'and' might be given by a molecularist version of inferential role semantics via specifying that the inference from '*p* and *q*' to '*p*', and from '*p*', '*q*' to '*p* and *q*' has a special status (for example, it might be 'primitively compelling', in Peacocke's terms; see Semantics, conceptual role). Atomism characterizes meaning and content in terms of none of the web; it says that sentences and beliefs have meaning or content independently of their relations to any other sentences or beliefs and, therefore, independently of any theories in which they appear.

Note the contrast between the semantic issues that are of concern here and those that concern particular phenomena in particular languages. Semantics in the present sense is concerned with the fundamental nature of meaning and what it is about a person that makes their words mean what they do. We might call the present sense the 'metaphysical' sense. Semantics in the other sense - what we might call the 'linguist's' sense - concerns the issues of how meanings of words fit together to determine the semantic properties and internal structures of sentences. Semantics in the linguist's sense concerns such issues as how many types of pronouns there are and why it is that 'The temperature is rising' and 'The temperature is 60 degrees' does not entail that 60 is rising. There are interactions among the two enterprises, but semantics in the linguist's sense can proceed without taking

much notice of the issue of semantic holism.

2 Motivations for holism

The best-known motivation for semantic/mental holism involves Quine's doctrine of *confirmation* holism, according to which 'Our statements about the external world face the tribunal of sense experience not individually but only as a corporate body' (1953: 41). This view gains its plausibility from the logic of theory revision. An experimental datum confirms (verifies; gives us some reason to believe) a statement only in conjunction with a great number of theoretical ideas, background assumptions about the experiment, and assumptions from logic and mathematics, any one of which could be (and in the history of science often has been) challenged when problems arise (see Confirmation theory). If we combine this confirmation holism with the logical positivist doctrine that the meaning of a sentence is its method of verification or confirmation (see Logical positivism; Meaning and verification), that is, if we combine the doctrine that meaning is confirmation with the claim that confirmation is holistic, we get semantic holism. And this implies that talk of the meaning of a sentence in isolation from other sentences makes no more sense than talk of the meaning of 'of' apart from the contexts in which it occurs.

Positivism and confirmation holism are not the only roads to semantic/mental holism. Another route proceeds from considering how people learn actual scientific theories. For example, one does not learn definitions of 'force', 'mass', 'kinetic energy' or 'momentum' in terms that are understood beforehand, for there are no such definitions. Rather, these terms are learned together (in conjunction with procedures for solving problems). As Quine (1954) and Putnam (1965) argued, local 'definitions' in a scientific theory tend to be mere passing expository devices of no lasting importance for the theory itself. And this is quite ubiquitous in theories, where there is a circle of interdefined theoretical terms none of which is definable in terms outside the theory. This fact motivates Lewis' proposal that scientific terms can be defined functionally in terms of their roles in a whole theory.

3 Must functionalism lead to holism?

Functionalism has become a popular approach in the philosophy of mind generally (see Functionalism). For example, the difference between the belief that one will win the lottery and the desire that one will win the lottery is plausibly a functional difference (a difference in the roles of the states), since one but not the other leads to test-driving a Ferrari. But functionalists go further, claiming that the common *content* of these propositional attitudes can also be functionally defined (in terms of the cognitive roles of states which have these contents in the psychological economy, including links to inputs and outputs). It has often been supposed that the most important feature of the functional role of a belief in determining its content is its role in inference, and for that reason functionalism about content or meaning is sometimes called 'inferential role semantics'. The functional role of a thought includes all sorts of causes and effects that are non-semantic, for example, perhaps depressing thoughts can lower one's immunity, causing one to become ill. Conceptual roles are functional roles minus such non-semantic causes and effects.

A functional theory of the whole mind must make reference to any difference in stimuli or responses that can be mentally significant. The difference between saying 'damn' and 'darn' can be mentally significant (for example, one can have a policy of saying one rather than the other). Your pains lead to 'darn', mine to 'damn', so our pains are functionally different, and likewise our desires to avoid pain, our beliefs that interact with those desires, and so on. So if we functionally define 'pain' in terms of a theory of the whole mind, we are naturally led to the conclusion that two individuals who differ in this way share no mental states. This is why functionalism can lead to holism.

Molecularists object that if you have a fine-grained way of categorizing, you can just coarsen it. But which causes and effects of pain are constitutive and which are not? The form of a solution could be: 'pain = the state constituted by the following causal relations…', where the dots are replaced by a specification of a subset of the mentally significant causal relations into which pain enters. Putnam suggested we look for a normal form for a computational description of pain, and Lycan (1988) and Rey (1997) have suggested that we construct functional theories at different levels, one of which would be suitable to define 'pain' without distinguishing between 'damn' and 'darn'. But after years of discussion, there is no real solution, not even a proposal of something functional common to all and only pains. Lycan and Rey expect the issue to be settled only by an empirical psychology. Moreover, even if one is optimistic about finding a functional definition of pain, one cannot assume that success

will transfer to functionalist accounts of meaning. Success in the case of meaning would seem to require an analytic/synthetic distinction which many have found independently to be problematic.

4 Problems with the analytic/synthetic distinction

Another route to holism arises from considerations involving the analytic/synthetic distinction, that is, the distinction between claims that are true solely in virtue of meaning and claims that depend also on the way the world is. Quineans often hold that the analytic/synthetic distinction is confused. Some philosophers have argued from the idea that there is something wrong with analyticity to holism. We can put the argument in terms of conceptual role semantics. It seems that some inferences (for example, from ‘bachelor’ to ‘unmarried’) are part of meaning-constitutive inferential roles, but others (for example, from ‘bachelor’ to ‘dislikes commitment’) are not. However, if there is no analytic/synthetic distinction, then there is no principled way to draw a line between inferences that constitute meaning and those that do not (see Analyticity). So, the argument concludes, if some inferences are part of meaning-constitutive inferential rules, *all* inferences are part of meaning-constitutive inferential roles, and this is a form of holism (Fodor and LePore 1992; Devitt 1995).

This argument is of course fallacious. A bald man can have some hairs, and there is no principled way of drawing a line between the number or distribution of hairs on a bald man and on a non-bald man. But one would not conclude that everyone is bald. Failure to find a principled way of drawing a line need not require one or the other extreme.

Still, the argument is onto something. How would the molecularist choose those inferences which are meaning-constitutive if the meaning-constitutive must be analytic rather than synthetic but there is no such distinction? In fact, the problem is more general, and far from being an argument *for* holism, it casts doubt on holism too. If meaning-constitutivity entails analyticity, any view - molecularist or holist - that postulates anything meaning-constitutive is in trouble if there is no such thing as analyticity.

One response to this argument has been to ‘challenge’ the principle that a statement or inference that is meaning-constitutive is thereby analytic (Block 1993). There are two very different points of view which see a gap between meaning-constitutivity and analyticity.

One approach to finding a gap between meaning-constitutivity and analyticity derives from the views of Quine and Davidson, on which there is no clear difference between a change of meaning and a change of belief (see Radical translation and radical interpretation). The other appeals to narrow contents (see Content: wide and narrow). Narrow contents are contents that are necessarily shared by ‘twins’, people who are internally as similar as you like, even though their environments differ. Consider the influential example of Putnam’s ‘twin earth’ which is a planet identical to earth in every respect except that wherever earth has H_2O, it has a superficially similar but chemically different substance, XYZ. Arguably, I and my twin on Putnam’s twin earth share a narrow content for ‘water’ despite the different referents of our words. If meaning is narrow in this sense, it is false that meaning-constitutive sentences or inferences are thereby analytic if meaning is narrow. The narrow contents which constitute meaning *themselves* are neither *true* nor *false* and hence cannot be true in virtue of meaning. For example, let us suppose that my twin and I accept the propositions that we express with ‘Water contains hydrogen’. My belief has a true wide content, my twin’s has a false wide content, but the narrow content has to be the same (since we are twins) and is therefore neither true nor false (see Putnam, H. §3). Further, we can even imagine a twin earth in which a putative meaning-constitutive inference is invalid. If there is any inference that is a good candidate for analytically defining ‘water’, it is the inference from ‘water’ to ‘liquid’. But consider a twin earth on which ‘water’ is used as here to refer to H_2O, but where water is very rare, most of the substances referred to as ‘liquids’ being granular solids that look like liquids. So ‘Water is a liquid’ as said by on this twin earth is *false*, even though it is true in our mouths. Perhaps it will be said that what is analytic is not ‘Water is a liquid’ but ‘Water has a liquidish look and feel’. But it is easy to imagine circumstances in which the look and feel of water changes. Perhaps what we should be looking for is not a narrow content that is *true* in virtue of meaning but one that is only *assertible* in virtue of meaning. But it is part of our commitment in the use of natural kind terms that the world plays a part in determining truth-values, so we must regard any appearance of warrant solely in virtue of meaning as superficial.

5 The problem of disagreement and translation

Holism has some weird-sounding consequences. Suppose we say that all of a sentence's inferential links (within a theory or body of theories) are included in its set of meaning-constitutive inferential roles. But what sentences I accept influences what I infer, so how can I reason so as to change my own mind? If I accept a sentence, say, 'Bernini stole the lead from the Pantheon', and then later reject it, I thereby change the inferential role of that sentence, so the meaning of the sentence that I accept is not the same as the one that I later reject. So how can I reason about which of my beliefs should be given up? Along similar lines, one can argue that no two people ever agree or disagree, and that we can never translate anything perfectly from one language to another. The holist owes us a way to reconcile such conclusions with common sense. This section will explore three holistic responses.

Harman (1973) and Block (1986) have argued that we can avoid the problem by replacing the dichotomy between agreement and disagreement with a gradient of similarity of meaning, perhaps multi-dimensional. If I first accept and then reject 'Bernini stole the lead from the Pantheon', it is not as if I have rejected something *utterly unrelated* to what I earlier accepted. This position profits from the analogy with the ordinary dichotomy between believing and disbelieving. Reasoning with this dichotomy can lead to trouble, trouble that is avoided if we substitute a graded notion for the dichotomy. For example, I can have a low degree of belief in a long conjunction even though I have a high degree in each of the conjuncts. But if we put this in terms of the dichotomy between believing and disbelieving, we say that I could believe each conjunct while disbelieving the conjunction, and that is a contradiction. The proposal, then, is that we substitute a graded notion of similarity of meaning for the ordinary notion of same/different meaning. It must be conceded, however, that there are no specific suggestions as to what the dimensions of similarity of meaning are or how they relate to one another.

This approach can be combined with the aforementioned 'two-factor theory', according to which meaning consists of an internal holistic factor and a non-holistic purely referential factor (see Semantics, conceptual role §2). For purposes of translation and communication, the purely referential factor plays the main role in individuating contents. For purposes of psychological explanation, the internal factor plays the main role (see Loar 1987).

There is another (compatible) holistic response to the problem of disagreement which is associated with the views of Quine, Davidson and Putnam, namely that there is something wrong with the terms in which the problem is posed. They explicitly reject the very distinction between disagreeing and changing the subject that is presupposed by the statement of the problem. Putnam (1988) and Stich (1983) have argued, along these lines, that translation is not an objective process; it depends on subjective value-laden decisions as to how to weigh considerations of similarity in reference and social and functional role. It is controversial whether this Quinean response avoids the problem of disagreement only by rendering meaning something unsuitable for science.

Another holistic response is exemplified by Lewis' observation (1995) that there is no need to suppose that a satisfier of a functional description must fit it perfectly - fitting *most* of it is good enough. Lewis proposes that in framing the functional roles, we replace the set of inferences that are the basis for a functionalized account of belief with the disjunction of all the conjunctions of most of them. Thus, if we think there are three inferences, *A*, *B* and *C*, that are closely linked to the meaning of 'if', we might define 'if' as the relation that satisfies either $A \,\&\, B$ or $A \,\&\, C$ or $B \,\&\, C$. (Of course, we thereby increase the danger that more than one relation will satisfy our definition.) Then disagreement will be possible between people who accept most of the inferences that define their subject matters.

I have just been canvassing holistic responses to the problem, but of course atomism and molecularism are also responses. Fodor's version of atomism (1987) construes meanings as purely referential. Fodor goes so far as to insist that there could be punctate minds; minds that have only one belief. This view must, however, find some way of accommodating the insights that motivate holism.

6 Psychological laws

Fodor and LePore (1992) object to holistic accounts of mental content on the ground that they would preclude psychological laws, for example, the belief that one is in immediate danger causes release of adrenaline. According to holism, there is no such thing as 'the' belief that one is in immediate danger because the belief that you designate in this way is not quite the same as the belief that I designate in this way. Beliefs are too fine-grained to be referred to in this way (see Belief; Propositional attitudes). One strategy for dealing with this issue is to observe

that many candidate psychological laws can generalize about contents without actually specifying them. Consider this candidate for a law: for *any* action *a* and any goal *g*, if one wants *g* and also believes that *a* is required for *g*, then one will try to do *a*. This is a universally quantified law (because of the role of 'any'), albeit a trivial one. Universally quantified laws are a good scientific bet, and these can involve holistic content. By quantifying over goals, one can state laws without committing oneself to two agents ever having exactly the same goal. The point just made says that the holist can allow one kind of psychological law (the quantified kind) but not another (the kind that mentions specific contents such as the belief that one is in danger). But the holist may go further, arguing that there is something wrong with the putative laws of specific contents. The point is that 'The belief that one is in immediate danger causes release of adrenaline' stands to psychological law as 'Large slippery rocks on mountain-tops can damage cars on roads below' stands to physical law. Laws should quantify over such specific items, not mention them explicitly (see Laws, natural; Explanation).

However, Fodor and LePore are right that any particular type of holistic state will exist only rarely and transiently. In this respect, holistic mental states are like the states of computers (see Mind, computational theories of). A total computer configuration as specified by the contents of every register in the internal memory and every cell on the hard disk will occur only rarely and transiently. There are deterministic laws of the evolution of total computer states, but they deal with such transient states. So psychological explanation will have to be seen by holists as like explanation of what computers do, in part a matter of fine-grained laws of the evolution of systems, in part coarse-grained accounts of how the systems work that do not have the status of laws.

7 Narrow-content holism

There is a great deal of controversy about whether there is such a thing as narrow content or meaning, but if narrow content exists, there is good reason to think it is holistic. We have already seen one reason having to do with the fact that there is no analytic/synthetic distinction for narrow content. But there is another reason as well that focuses on change of narrow content with learning. Putnam (1983) and Block (1994) give an argument that uses some relatively uncontroversial premises about identity and difference in narrow content at a single time to squeeze out a conclusion to the effect that one's narrow contents can be expected to change whenever one receives substantial new information, however trivial. The argument depends on a variant of the famous 'twin earth' example. Consider twins who grow up in different communities where 'grug' is used to denote different substances, beer in one and whisky in the other, but the difference has not made any difference to the twins. At the age of 10, they are as similar as you like, and so the narrow contents of their 'grugs' are the same. By the age of 12, they know as much about 'grug' as teenagers normally know, including the (different) translations of 'grug' into English. One knows that 'grug' in his language is beer, the other that 'grug' is whisky. The argument motivates the claim that their 'grugs' differ in narrow content at 12 despite being the same at 10, so the information that they have acquired (which is designed to be run-of-the-mill) has changed the narrow contents. (But see Devitt 1995 for a reply.)

Issues about holism continue to be at the heart of debate in philosophy of language and mind. In the mid-1960s, it was widely assumed that to be a holist was to be a sceptic about any science of meaning or content, but thirty years later there has been a spirited debate about whether cognitive science can tolerate it.

Holmes, Oliver Wendell, Jr (1841-1935)

The most famous judge in the history of the USA, Holmes was also one of the most important US legal theorists. Within US jurisprudence, his work prefigured and stimulated the development of a general distrust of abstractions. Holmes emphasized that, in so far as logical deductions and abstract principles play any role at all in the law, they are side-effects of the ways in which struggles among different interests have been varyingly resolved. For him, the life of the law was not logic but experience; and experience was too diverse and conflict-ridden to be controllable on the basis of any sweeping formulae.

Born in Boston, Massachusetts, Holmes attended Harvard as an undergraduate and (after service in the American Civil War) as a law student. He then practised law for sixteen years, towards the end of which he published his most famous work, *The Common Law* (1881). After a very brief stint as Professor of Law at Harvard, Holmes became a Justice on the Massachusetts Supreme Judicial Court, where he remained for two decades. In 1902 he moved to the United States Supreme Court, where he served as a Justice for three decades.

Having befriended William James, C.S. Peirce and other like-minded men at Harvard, Holmes infused his jurisprudential writings with the spirit of pragmatism and legal positivism. Perhaps the most striking expression of that spirit in Holmes' work was the predictive theory of law which he developed in his famous essay 'The Path of the Law' (1897) and elsewhere. Although Holmes there spoke somewhat strangely of rights and duties as predictions, his analyses make clear that he viewed our *ascriptions* of rights and duties - rather than the rights and duties themselves - as predictive. To ascribe a legal right to someone is to predict that the person will (if necessary) be protected by the coercive power of the state in specified ways. Conversely, to ascribe a legal duty to someone is to predict that the person will (if necessary) be authoritatively punished for performing a forbidden act or for declining to perform a required act. Far from being mysterious entities, rights and duties are positions which people occupy in varying configurations; specifically, rights are positions of protectedness, and duties are positions of threatenedness.

Not only one's attributions of rights and duties, but also any other statements within and about the law, are essentially predictive. Laws and analyses of laws amount to forecasts of the consequences that attend disobedience. Such, at least, is the view which 'The Path of the Law' declares: 'The prophecies of what the courts will do in fact, and nothing more pretentious, are what I mean by law' (1897: 461). This famous assertion did not bespeak a cynical 'anything goes' attitude towards legal decision-making, but simply flowed from Holmes' legal-positivist belief that official pronouncements and actions - as opposed to extra-legal standards - are the keys to the content and indeed to the very existence of law. Such a positivist stance can perfectly well square with the fact that what judges do in any of the liberal democracies is usually to interpret statutes or other legal materials (including past judicial decisions, of course) in an effort to find and apply relevant laws rather than create them entirely afresh. Though the distinction between finding and creating law is highly problematic, and though the particular means by which any legal system distinguishes finding from creating are decidedly variable, the judicial role in liberal democracies is based on such a distinction. Hence, a reduction of law to 'what courts do in fact' is fully compatible with the thesis that judges apply existent laws scrupulously.

Holmes' affinities with the pragmatists and his emphasis on predictability turn up further in his insistence that the relevant standards of evaluation within the law - standards such as reasonableness - are fundamentally external. Holmes pointed to two kinds of externality. First, the legal standards are brought to bear on people's behaviour rather than on their inner capacities and convictions. The law requires people to tailor their conduct to comply with the norms that regulate their interaction; if some people cannot live up to those norms (because of unintelligence, for example), they will usually be held responsible none the less. Outward deeds, as opposed to inward sentiments, are the overriding concern of the law. A second and partly related way in which the law's standards are external is that they typically flow from the *mores* of the general public rather than from the preferences of a wrongdoer or from the preferences of the decision-maker who passes judgment on the wrongdoer. A judge or a juror should seek to decide cases not on the basis of personal predilections but on the basis of ideals and expectations that are widely shared throughout the community in which the cases arise.

Holmes consistently exhibited a pragmatist distrust of abstractions. With his predictive theory of law, for instance,

he explicated the abstractions of legal parlance by reference to their concrete functioning. There are two basic complaints against a reliance on abstractions in his writings. First, he believed that such a reliance was pointlessly ineffectual. As *The Common Law* proclaims: 'An answer cannot be obtained from any general theory…. The grounds of decision are purely practical, and can never be elicited from grammar or from logic' (1881: 264). Abstract principles in themselves are empty and boundless, and they therefore simply distract us from our genuine problems. Furthermore, even if abstractions could yield determinate guidance, an adherence to them would be undesirable. As Holmes stated: 'To rest upon a formula is a slumber that, prolonged, means death' (1915: 3). Anyone who conjures with abstract formulations is attempting to lock the flux of reality into static moulds. For Holmes, who perceived human existence as a constant and highly salutary struggle among vying interests, the quest for overarching legal/ethical guidelines that could transcend all divisions was a denial of progress and of life itself.

Holocaust, the

The specific, tragic event of the Holocaust - the mass murder of Jews by the Nazis during the Second World War - raises profound theological and philosophical problems, particularly problems about the existence of God and the meaning of Jewish existence. Among the thinkers who have tried to wrestle with the conceptual challenge posed by the destruction of European Jewry, three who have presented original arguments that can be termed, in a relatively strict sense, philosophical are Richard L. Rubenstein, Emil Fackenheim and Arthur A. Cohen.

Rubenstein has formulated an argument that turns on the theological difficulties raised by the realities of the evil of Auschwitz and Treblinka in a world putatively created and ordered by a benign God. For him, such evil decisively refutes the traditional theological claim that a God possessed of goodness and power exists, and entails the conclusion that 'there is no [traditional] God'. In working out this conceptual position, he uses an unsatisfactory empirical theory of verification concerning religious propositions and too narrow a notion of evidence, both historical and ethical, that ultimately undermines his counterclaims and 'Death of God' affirmations.

Fackenheim seeks not to defend a religious 'explanation' of the Holocaust, but rather to provide a 'response' to it that maintains the reality of God and his continued presence in human, and particularly Jewish, history. To do so, he uses Martin Buber's understanding of dialogical revelation, asserting that revelation is an ever-present possibility, and formulates his own moral-theological demand to the effect that after the Holocaust, Jewish survival is the '614th commandment' (there are 613 commandments in classical Judaism). Fackenheim's defence of this position, however, is philosophically problematic.

Cohen probvides a 'process theology' argument as an explanation of the Holocaust; that is, the Holocaust requires a revision in our understanding of God's nature and action. It forces the theological conclusion that God does not possess the traditional 'omni' predicates; God does not intervene in human affairs in the manner taught by traditional Western theology. However, Cohen's working out of a process theological position in relation to the Holocaust raises as many philosophical problems as it solves.

1 Richard Rubenstein

Rubenstein has been attempting to make sense of the Holocaust since the 1960s, when he published his well-known collection of essays *After Auschwitz* (1966). The theological position he articulated in this first work has changed little over the years: Auschwitz and Treblinka decisively refute any belief in the existence of God or that life is made meaningful by a transcendent source. Had God existed, he would not have permitted the Death Camps, he would have put a stop to the slaughter (see Evil, problem of). Since God does not exist, the universe is a meaningless conglomeration of circumstances without transcendental direction, purpose or warrant. Accordingly, Rubenstein rejects all such traditional Jewish beliefs as the sanctity of the Torah, the normativity of the *mitzvot* (commandments), and divine creation, covenant, revelation and redemption.

Beginning with this series of negations, Rubenstein, like such atheist existentialists as Jean-Paul Sartre, formulates an existential affirmation that creates human meaning without assistance, and so redeems human life from absurdity - to the extent that this is possible. In a world without inherent value, all we have is ourselves and each other; self-confirmation and communal belonging become ultimate values. The living Jewish community, in particular, is not rejected, but it is fundamentally redefined. In place of the divinely chosen, covenanted people of tradition, we find in the Jewish Community a human fellowship that is socially and psychologically supportive despite the denial of its ancient theological message.

Rubenstein gives essentially empirical grounds for his denial of the existence of God: propositions about God are to be straightforwardly confirmed or disconfirmed by appeal to empirical events in the world. On the basis of these events Rubenstein judges that 'God is dead'. The Holocaust becomes the critical empirical test, demonstrating God's nonexistence. In effect Rubenstein argues: there is too much evil in the world, there was too much at Auschwitz, to allow us any longer to affirm that God, as conceived in Judaism, can exist (see Atheism).

Respecting this challenge as an important one, too often lightly dismissed by theologians, and respecting Rubenstein's authentic existential response to an overwhelming reality, one needs to recall that empirical

falsifiability is not generally definitive in theological matters and does not provide the unimpeachable criterion that Rubenstein seeks. History provides evidence both for and against the existence of God, since there is both good and evil in history. The issue may turn on the questionable coherence of verificationism itself. But even one who accepts Rubenstein's assumption that theological judgments can be grounded in historical events, might dispute what counts as crucial empirical or experiential evidence. The State of Israel is also an empirical datum, and some argue that if Auschwitz is evidence against the 'God-Hypothesis', the re-establishment of the State of Israel is evidence in its favour. Neither position is decisively provable but both are equally meaningful.

In recent works like *The Cunning of History* (1975), *The Age of Triage* (1983), and the new edition of *After Auschwitz* (1992), Rubenstein has increasingly turned away from narrowly theological and philosophical concerns to a broader comparative sociological form of inquiry that draws on the thinking of Hegel and Max Weber and emphasizes the important role of the historical development of bureaucracy, technology and capitalism in deciphering not only the Holocaust but modernity at large. Rubenstein now sees the Holocaust as the culmination of a variety of negative processes that have increasingly defined modern European history since the sixteenth century. The Nazi Death Camps, he now contends, were an extension of the logic of New World black slavery, a rational and bureaucratic exploitation of labour taken to the ultimate extreme. The murder of European Jewry was the maximal application of modern notions of surplus population control. These sociological and historical claims have met with considerable critical resistance.

2 Emil Fackenheim

Emil Fackenheim is perhaps the best-known philosophical respondent to the Holocaust. Careful to insist that his work be understood as a 'response' to the Death Camps and not as an explanation of them, he vehemently rejects the notion that suffering is the result of sin (a classical Jewish doctrine sometimes applied to the Holocaust: that is, that it was God's way of punishing Israel for its sins). Fackenheim has sought principally to provide reasons for Jewish survival, to give meaning to ongoing Jewish communal life, after the Holocaust.

He begins with what he acknowledges to be a Buberian model of revelation: revelation is the ever-present possibility of divine-human relationship that speaks anew in every historical and inter-human context. This existential possibility is not subject to objective or public proof, any more than is the existence of God. But, taken on faith, this Buberian dogma, that God cannot be proven but can be met, undergirds Fackenheim's mature reflections on a post-Holocaust Judaism (see Buber, M.).

We witness God's presence in history, Fackenheim argues, in the experience of the people of Israel throughout its existence, and this in two ways: in the 'root experiences' of the people of Israel, and in 'epoch-making events'. The first are creative, extraordinary historical happenings that decisively form the character and continue to influence all future 'presents' of the Jewish people, forever legislating in every future generation of the nation. The Exodus from Egypt, for example, is a historical movement relived every Passover; its power affects each new generation, continually revealing in its yearly re-enactment the saving activity of God. Because past root experiences are lived through as present reality, Jews in every age are 'assured that the past saving God saves still'.

'Epoch-making events' are not formative for Jewish collective consciousness. They are historical challenges to the root experiences, demanding an answer to new and often unprecedented conditions. The occurrences encompassing the destruction of the First and Second Temples were such events. They tested the foundations of Jewish life, specifically the existence of the saving power and commanding providence of God, as previously revealed in the Exodus and at Sinai. But they did not shatter them, as the survival of the Jewish people testifies. The traditional interpretive paradigm has always shown its resiliency, absorbing and surviving the catastrophes that shook its foundations.

What, then, of Auschwitz? Can it be assimilated to Fackenheim's ancient and rather midrashic model? Fackenheim's answer is an unreserved 'yes'. Even Auschwitz does not destroy the 'root experiences' of Israel's faith. God is present even in the Kingdom of Night, commanding Israel still, from within the eye of the storm itself. This extreme reply of unwavering affirmation, in the face of the unprecedented terrors of Auschwitz, is the core of Fackenheim's response and that of others who follow his lead: a Jew cannot, dare not, must not, reject God. Auschwitz itself is revelatory, commanding, and one must learn to sense what God would reveal to Israel

even there.

The commanding word of Auschwitz, which Fackenheim, in a now famous phrase, called the 614th commandment, is this: 'Jews are forbidden to hand Hitler posthumous victories!'. After Auschwitz, Jews are under a sacred obligation to survive; Jewish existence is itself a holy act; Jews have a duty not only to remember the martyrs but to remain open to the possibility of redemption. To succumb to cynicism is to abdicate responsibility for the here and now and to deliver the future over to the forces of evil. Above all, Jews are 'forbidden to despair of the God of Israel, lest Judaism perish'. Hitler's demonic passion was to eradicate Israel from history. For the Jew to despair of the God of Israel as a result of Hitler's monstrous actions would be to do Hitler's work and by a dreadful irony to aid in the accomplishment of Hitler's goal.

The Jewish will for survival is natural enough, but Fackenheim invests it with transcendental significance: precisely because others would eradicate Jews from the earth, Jews are commanded to resist annihilation. Hitler makes Judaism after Auschwitz a necessity. To say 'no' to Hitler is to say 'yes' to the God of Sinai; to say 'no' to the God of Sinai is to say 'yes' to Hitler. Since 1945, every person who has remained a Jew has, from Fackenheim's perspective, responded positively to the commanding voice of God heard at Auschwitz.

What Fackenheim affirms here is only half of the traditional content of Judaism: the God of biblical faith is a commanding as well as a saving God. The crossing of the Red Sea is as central to Jewish history as the revelation at Sinai; both are 'root experiences'. Fackenheim has made much of the commanding presence of Auschwitz, but where is the saving power of the God of the Exodus? Without the crossing of the Red Sea there is no Sinai, as Fackenheim knows. He also knows that to talk of a God of deliverance, no matter how tentatively, after the Holocaust is highly problematic, since God did not work his kindness there and then. The continued existence of the people of Israel, however, and specifically the re-establishment and survival of the State of Israel, allow Fackenheim to risk speaking of hope and the possibility of redemption. The destruction of European Jewry and the birth of the State of Israel are, for him, inseparably linked (see Zionism). What the Holocaust seems to deny, the new state, at least tentatively, affirms, a living testimony to God's continued presence in history that reconfirms the 'root experience' of salvation essential to the survival of Jewish faith.

Despite its interest and wide appeal, Fackenheim's response is not philosophically unproblematic. At least three issues need to be raised: (1) Is Buber's 'I-Thou' dialogical theology an adequate basis for a post-Holocaust religious commitment (see Buber, M. §§3-4)? Can it ground Fackenheim's particular project? (2) What exactly can Fackenheim mean, in light of his Buberian starting point, by referring to a 614th commandment? That is, what are the meaning and force of the notion of a commandment in this context? (3) How can Fackenheim confront the issues of meaning, verification and disconfirmation that are raised but not adequately addressed by his important work?

While raising the level of discussion as regards the philosophical significance of the Holocaust, Fackenheim leaves us with a position that is not entirely conceptually compelling.

3 Arthur A. Cohen

Four highly ramified theses lie at the root of Arthur Cohen's philosophical reflections on the Holocaust, as expressed in his work *The Tremendum* (1981): (1) the Holocaust is unique, and its uniqueness entails particular theological consequences; (2) human thought cannot grasp the enormity of Auschwitz; (3) no 'meaning' is to be found in this genocidal carnage; (4) evil is more real, more consequential, than many, including Cohen himself, had heretofore allowed. These four radical reflections lead Cohen to recognize a need to return to the traditional questions of theology with a new uncertainty, to ask again concerning 'the reality of evil and the existence of God, the extremity of evil and the freedom of man, the presentness of evil and the power of God' (Cohen 1981: 97). They lead him to ask, still more concretely, if,

> like our ancestors we are obliged to decide whether (national) catastrophes are compatible with our traditional notions of a beneficent and providential God. The past generations of Israel decided that they were. The question today is whether the same conclusion may be wrung from the data of the *tremendum*.
>
> (Cohen 1981: 86)

Cohen's reply is that the traditional Jewish 'God concept' cannot survive the Holocaust but requires radical

revision along the lines suggested by Alfred North Whitehead and Charles Hartshorne (see Process theism). God is neither to be blamed for the Holocaust nor censured for not stopping the murder. But the idea of God and of God's relationship to the world needs to be reinterpreted in what Cohen calls a 'di-polar' manner. God, on this redefinition, though loving, is respectful of human freedom and, whether by choice or metaphysical necessity, does not interfere in human history.

Provocative as it is, Cohen's position raises a host of philosophical and theological questions. Is God still God if he is no longer an agent of providence? If he lacks the power to enter history vertically through miracles? Is the dipolar Absolute still the God to whom one prays, the God of salvation? Is the non-interfering God 'whom we no longer fear and from whom we no longer demand' still, as Cohen would have it, worthy of our 'love and honour?' Is this God now reduced to the status of Plato's Demiourgos (see Plato §16), or perhaps closer still to the innocuous and irrelevant God of the Deists (see Deism)? Such a God, it could be argued, makes no difference in how we act and plays no role at all in how history revolves or transpires. If God is indeed so absent from our life and from the historical record, what difference remains for us between this God and no God at all?

Furthermore, the proposed metaphysical reconstruction is founded on no direct phenomenological or experiential procedure, but fashioned, in the present instance, in response to the Holocaust. If so, belief in the dipolar God requires as great a 'leap of faith' as do the theistic affirmations of the ancient Jewish tradition - greater, perhaps, since the new God lacks the support of history and tradition.

It is difficult to see why one would turn towards dipolar theism, given the tragedy of the Holocaust, unless one were already committed to theism to start with. But Cohen has not shown why we should begin with this assumption. The moral dimension of theodicy remains to be dealt with, moreover. For Cohen's dipolar God appears, of necessity, indifferent to human suffering and acts of evil. In short, Cohen's revision of the 'God-concept', and the whole process-theology response to the Holocaust, raises at least as many questions as it answers (see God, concepts of).

4 Conclusion

The Holocaust has shown itself to be an extremely difficult matter to philosophize about. This is because of the enormity and complexity of the issues it raises for all human reflection and for Jewish philosophical deliberation in particular. It has not been shown that the *Shoah* (Holocaust) disconfirms all pre-Holocaust metaphysical and theological systems; but, given the reality that is the *Shoah*, it is correct to require that all philosophical and theological judgments be called upon to measure their conceptual adequacy against the circumstances of Auschwitz and Treblinka.

Home, Henry (Lord Kames) (1696-1782)

Henry Home (better known as Lord Kames, his title as a Scottish judge of the Courts of Session and Justiciary) was an important promoter of and contributor to the Scottish Enlightenment. His philosophy was a search for causes which could serve as the bases of policies to improve most aspects of Scottish life and thought. His writings, like his involvements in clubs, government bodies and improving economic activities, were all means to enlightened and improving ends. Kames was perhaps the most typical thinker of the Scottish Enlightenment, uniting interests in philosophy, science, belles lettres, *history, education and practical improvements of every sort.*

Born in Eccles, Berwickshire, Henry Home, Lord Kames' parentage related him to the Jacobite and Whig gentry but also to the professional classes. Unfortunately, gentility did not confer wealth. Kames' notable interests in improvements were made necessary by his relative poverty which lasted until *circa* 1766 when his wife, Agatha Drummond, inherited the Blair Drummond estate in Stirlingshire. By the end of his career he had been honoured by societies or academies in Manchester, Philadelphia and Berne; he had also been attacked by Voltaire. At home his philosophic views seemed to many overly naturalistic and secular, even atheistic in their tendencies. Such conclusions were relatively easy to draw because Kames tended to deny free will, criticized Newtonian physics (the great prop to design arguments for the existence of God) (see Newton, I.) and extended the scope of sense and reason beyond what the religious were prepared to accept. He never produced a system based on the methods and views of his favourite philosophers - Francis Bacon, Isaac Newton, John Locke, the Third Earl of Shaftesbury and Joseph Butler - but in his works he laid out views which foreshadowed Scottish Common Sense philosophy (see Common Sense School).

Kames, like David Hume, Thomas Reid and other Scots, thought that all knowledge and belief had to be related to human nature, that is the structure and capacities of the mind. His clearest statements of this belief are found in *Essays on the Principles of Morality and Natural Religion* (1751, revised 1758 and 1779), but they are not lacking in other works. Kames found his great guides in sense and feeling. Belief comes from a simple, unanalysable feeling not identical with Hume's 'vivacity of perception' or other modes of awareness. If we have the feeling, we are caused and determined to believe in what we have perceived or remembered or what the critically evaluated testimony of others induces us to believe. Experience shows us a world in which causation is perceived - in ourselves as we will and act, in matter as objects at rest or in motion collide or move in determinable ways apparent to our senses of touch and sight. We do not know why or how objects move, but *motion*, *rest*, *power*, *cause* and *effect* are simple ideas derived from our experiences and requisite to the establishment of both morality and physics.

Kames differed from Newtonians in believing matter to be active and self-moving but bound by God to rules of motion which Newton's physics defined. Surveying nature revealed a lawful and designed world, a beautiful system of related causes and effects. Taken as a whole, it was an effect which led irresistibly to a belief in a creative and benevolent God. Sensations and feelings may mislead us but they do not regularly do so when inductions are carefully made. Moreover, we find in them signs of the substances whose qualities sensations reveal and of which they are correlatives. Through the external senses we perceive external objects; through the external and internal senses we know ourselves and others as enduring and identical persons.

The internal senses are important to Kames' morals and aesthetics. Morality, he thought, rests on instincts, feelings of pleasure and pain and sensations of right or wrong, propriety and impropriety, all of which are produced because we possess moral senses, 'the voice of God within us' (*Essays*, 1751: 63) (see Moral sense theories). This view owes more to Joseph Butler than to the Earl of Shaftesbury, Francis Hutcheson or George Turnbull. Kames may well have developed it independently, and prior to the publication of David Hume's earlier works.

Kames extended these views to law. Criminal laws rest on a sense of impropriety, upon the perception of the improper actor as guilty and one whose actions we resent and try to punish. Sympathy allows us to participate in the feelings of revenge raised in other injured parties. Laws in the various stages of society express all this in ways which depend upon levels of civility. Civil law rests in like manner upon changing notions of property, contract, society and of the wrongness of their violation. The laws of all peoples will, Kames believed, eventually converge, which led him to hope for a more perfect union between England and Scotland.

Kames developed his views of aesthetics in a somewhat similar fashion. A work of art evokes in our internal sense feelings of beauty, sublimity, grandeur, novelty and propriety. Understanding how this comes about and judging the means to their production are the functions of aesthetics and criticism. Kames did this so well that his *Elements of Criticism* (1767) remained a useful textbook in America until the mid-nineteenth century.

Kames' views were unacceptable to many. John Stewart, the pious Edinburgh Newtonian, attacked his science and metaphysics because it allowed for a Godless, self-acting, self-designing world of mere matter. Kames' denial of free will (1751) was condemned by Church courts in 1757 - an event which showed some of the limits to Scottish enlightened thought. His views on law were severely criticized by utilitarians, although the historicism with which they were associated survived (see Historicism). Indeed, his historical views resonated well into the nineteenth century, touching many fields such as sociology and anthropology and contributing to more general views of progress. In philosophy his work set out strategies pursued by the Scottish Common Sense philosophers, who more skilfully defended views he had held. When Lord Kames died many Scots mourned the man who, for contemporaries, was Scotland's most notable philosopher.

Homer (*fl. c.*700 BC)

Author of the Iliad and Odyssey, the Greek poet Homer is probably the earliest surviving, and certainly among the greatest, of European poets. Down to the Renaissance he was considered the source of all scientific and philosophical wisdom; and he still supplies fruitful material for philosophical discussion of moral issues.

For ancient, and many modern, thinkers Homer was most interesting philosophically for the rather primitive cosmological views he no doubt took over from Greek popular belief. 'The Shield of Achilles' (*Iliad* XVIII), with its even-handed depiction of the totality of human life - war and peace, city and country, youth and age, birth and death, dance and trial - all encompassed within nature's temporal cycle of the seasons and the spatial horizon of the heavens and all-surrounding Ocean, sets the bloodily narrow-minded action of the Trojan War in a larger, humanizing context; this image of the largest sources and limits of our human world is filled out by scattered references elsewhere to the brazen heavens, to Ocean, the origin of all things, and to Night's primordial power. Familiarity with an allegorical interpretation of divine myths is implied already in some passages in Homer himself (for example, 'the Battle of the Gods', *Iliad* XX, XXI); this technique went on to become a central way of reinterpreting his authoritative text for later needs: in part fostered by Homer's role as a major author read in schools, this long-lived tradition could claim that numerous philosophical and scientific doctrines were anticipated and legitimized by the poet's words.

In modern times, philosophical attention has tended to focus instead upon Homer's narrative account of human action and responsibility. Homer's poetry, although written, is the culmination of an oral epic tradition, in which many generations of poets gradually refined and improved an inherited body of traditional legendary tales. Homer seems to have inherited stories of divine determination and bloodthirsty war but himself to have preferred to tell them, at least in part, in terms of moral responsibility and humane compassion: the *Iliad*, whose first word is 'wrath', turns out in the end to be no less concerned with pity. The generic tension produced by an oral epic evolving over time through incrementally quite different ethical conceptions ended by posing for Homer the fundamental question to what extent freedom of choice, individual responsibility and feelings of guilt were compatible with the determinative influence of seemingly external factors like gods, oracles, destiny and temporary infatuation. His answer takes the form not of stringent argument but of compelling narrative and, above all, of direct speech in which characters lay bare the wellsprings of their action with breathtaking clarity: external factors turn out always to be involved and to affect the outcome of choice and action, but they never prevent human agents from choosing freely, erring irremediably and being regarded, by themselves and by others, as fully culpable - at least until they choose to accept their human limitations and to acknowledge their culpability in the eyes of their society and, especially, in the eyes of those they have wronged.

Honour

Honour consists in living up to the expectations of a group - in particular, in keeping faith, observing promises, and telling truth. This restriction to a particular group is not easy to justify against the background of universalist theories of ethics, and neither does honour accord readily with the central modern concepts duty and utility. Honour requires a social context in which individuals can bind themselves, and has tended to be restricted to free, adult males, who alone have been thought to have the capacity to bind themselves in this way. Older traditions, however, regarded honour as the goal of all virtuous action; and newer thinkers have been rediscovering attractions in this view.

Honour is the disposition to fulfil promises and commitments, whether explicit or implicit, made to other members of a group. Honour has traditionally been important in public affairs, with political and commercial life resting on the notion that commitments must be 'honoured' even without explicit obligation by the person concerned.

Even thieves have honour, however, which seems to show that honour's compatibility with dubious principles makes it a crude guide to moral action. In many respects, indeed, it looks morally atavistic. Hobbes' disquisition about the nature of honour (1651) seems to voice only the crude principles of a society at war (compare Reiner 1972). Today, almost all functional applications of honour have been individualized and legalized. Nobody today fights duels; attempts to vindicate feminine honour would most often, if not always, meet with scorn; politicians no longer tend to resign; conduct in commercial organizations and other traditional concerns of honour are regulated by law. Only at the margins does scope for honour remain, for example *vis-à-vis* gambling debts, which are not recoverable by legal action.

Most modern philosophers would regard honour as superficial to the proper concerns of moral philosophy. Kant's contrast between honour and 'what is in fact useful or dutiful' is probably typical ([1785] 1903: 398). Utilitarianism finds honour inexplicable, for the value of honourable behaviour is not rationally determined by its consequences (see Utilitarianism; Consequentialism). For deontology, the relativity of honour condemns it as cynical (compare the thieves) (see Deontological ethics).

None the less, Aristotle, in *Nicomachean Ethics*, called honour the 'end of virtue' (1115b13); modern virtue ethics more or less explicitly follows this tradition (see, for instance, MacIntyre 1980, Solomon 1993); and even consequentialists seem to be rediscovering its appeal (expressly in Hollis 1992). What has mainstream ethical individualism, with its bare choice between consequentialism and deontology, overlooked?

The structure of honour seems to be as follows. At its heart is a comparatively formal disposition, namely 'fidelity, the observing of promises, and telling truth' (Hume 1741/2: 294). The commitments entered into are not contractual in nature and do not presuppose reciprocal utility. Honour involves a context in which others also assume comparably onerous roles; but despite this background, individuals who assume a role bind in the first instance only themselves.

Only agents considered to have full capacity can bind themselves in this way. Historically, and to a degree even now, children, slaves and women cannot bind themselves, and hence commitments in relation to their roles have to be taken over by proxies (usually males of full age and capacity). Capacity is a condition for the possession of honour.

The content of the commitments assumed by the agent is dependent on social context - which is why thieves can still be honourable. The commitments may coincide with duty (deontologically conceived) or even utility; but they may equally be virtues of a kind not always directly reconstructible in this way, such as continence, bravery, generosity and so forth. They are not generalizable or absolute; the content of honour varies with the honourable society, and is subject to no universal codes.

The fact and degree of honour, by contrast, are amenable to general ascertainment, for the quantity of commitments satisfied is a measure of the agent's capacity. Honour is most evident in those with the means to fulfil conspicuous promises. This is why princes and 'magnificent persons' are favourite illustrations of honour (in Aristotle and Hobbes), and why incapacities such as illness or poverty, even when undeserved, diminish honour.

For Hobbes, honour is by its very nature a display of *power*, and 'to honour' is to acknowledge that power in others.

Honour is the final goal and completion of the virtues, which thus do not have value independently of the moment when they are undertaken in commitment to an honourable life (*Nicomachean Ethics* 1115b13; compare also 1122b7).

There are several obvious difficulties connected with the concept of honour. First, it is sometimes argued that honour is primarily a matter of status or of passively acquired reputation. If, however, honour is the sum of a person's virtues, then personal merit must be involved to a degree. So contrary to Solomon's view (1993), honour does depend on what one has done, or is taken to be prepared to do; simply being 'a member of the group in good standing' is a defective form of honour.

A second problem is the apparent connection between honour and uncritically affirmed collectives, as in 'the honour of the school', and so on. However, although honour requires an interpersonal context, only individuals possess it. Honour is the sum and goal of an individual's virtues; it is not properly attributable to groups (football teams, nations, religions, or even, in the final degeneration of this kind of thinking, races). Commitment to the interests of some specific group, while no doubt essential to honour, does not entail conferring personality on it.

Third, honour reflects the interests and concerns of its social context, and other societies' notions of honour can seem alienating or downright immoral. Nonetheless honour is a formal concept and can in principle be adapted to 'enlightened' concerns. Its central structural motif, that value resides not in individual acts or dispositions, but in their participation in an interpersonally directed whole, is present in a number of modern ethical systems. It is most obvious in Nietzsche, who in his doctrine of the 'will to power' institutes the same equivalence between honour and power as does Hobbes, while at the same time allowing for the virtues to be completed by power in a broader, nonpolitical sense (see Nietzsche, F. §11). It also emerges in G.E. Moore's insistence that virtues have value only when practised for the sake of a higher 'organic unity' (1903: 225, 238; compare *Nicomachean Ethics* 1115b13) (see Moore, G.E.).

It remains an open question, perhaps, whether the nonuniversalism of systems founded on honour is not too restrictive for the scope of modern ethical intuitions, notably in such areas as international human rights (see Universalism in ethics §1). This is a difficulty for all nonuniversalist doctrines such as virtue ethics and communitarianism (see Community and communitarianism).

Hooker, Richard (1554-1600)

Hooker's Of the Laws of Ecclesiastical Polity (1593-1662) is the first major work of English prose in the fields of philosophy, theology and political theory. After setting out an entire worldview in terms of the single idea of law, Hooker attempted to justify - and, arguably, to transform - the religious and political institutions of his day. Hooker's work contributed to later, more narrowly political, political thought (Locke cited 'the judicious Hooker' at crucial points in his Second Treatise of Civil Government), but the Laws is chiefly significant for articulating the ideal of a society coherent in and through its religion, a body politic which succeeds in being - not merely having - a church. In Hooker's England this meant that royal authority in religion was extensive, but derived from the community and limited by law. Modern separations of politics from religion and of philosophy from edification have made him difficult to assimilate. More recent critiques of Enlightenment secularism and purely technical philosophy help make him again intelligible.

1 Life

Hooker was born in England, near Exeter. With the help of Bishop John Jewel, the first official apologist for the Elizabethan religious settlement of 1559, Hooker attended Corpus Christi College, Oxford, where he later taught logic and Hebrew. In 1585 his appointment as Master of the Temple made him chief pastor of an important centre of legal studies. His surviving sermons, all from this period or earlier, show notable concern for the crises of faith experienced by reflective Christians during the Reformation. In 1591 he resigned from the Temple to work on *Of the Laws of Ecclesiastical Polity*. The preface and first four books were published in 1593, Book V in 1597. Hooker died in 1600. The politically sensitive last three books were published, in unfinished form, between 1648 and 1662.

2 The kinds of law and other principles

Although formally addressed to Puritan critics of the Elizabethan religious establishment, *Of the Laws of Ecclesiastical Polity* is also directed to the large number of Hooker's compatriots who were reluctant or unwilling to participate in the life of the English church after Pius V's excommunication of the Queen in 1570. Hooker's aim in Book I was thus to lay out normative principles acceptable to the broadest possible range of Christians at a time when violent accentuation of differences was more usual.

The scheme of laws Hooker set forth in Book I comprises (1) a twofold eternal law, in accordance with which (a) God's own voluntary actions are carried out and (b) creatures are directed to their various ends; this second eternal law subdivides, in application to the different kinds of creatures, into (2) a law governing the lives of the angels; (3) laws of purely 'natural' (that is, non-rational) agents; (4) principles of individual and social morality rationally discoverable by human beings; (5) laws made by humans themselves, consisting of (a) 'mixedly' human laws, which set down what we are already obliged to do on rational grounds, and (b) 'merely' human laws, which make obligatory actions which had not previously been obligatory; and (6) divine law, the supernatural law of biblical revelation, by which God directs fallen human nature to eternal blessedness.

It is a mark of Hooker's success in constructing a generally acceptable normative context for his later discussion of disputed issues that Book I can be read as an extraordinarily eloquent but unoriginal distillation of the wisdom of the ages. There is more to it than that. Hooker weaves together some quite diverse past wisdoms, and his elaboration of at least three particular points has substantive significance. First, in defining law as any rule directing to goodness of action, Hooker explicitly refrains from making imposition by a superior essential to law. Further, he argues that human beings are naturally equal with respect to political association. Accordingly, he urges the necessity of consent as a basis for governmental authority and, particularly, for legislative authority (see Authority §3).

The presentation of a lawful cosmos in Book I of the *Laws* has commonly been taken to be Hooker's greatest claim to philosophical merit. Other, more overtly polemical, parts of his work also deserve attention. Before undertaking his account of 'laws and their several kinds in general' in Book I, Hooker had found it necessary to gain breathing space from the Puritan contention that God's law, revealed in the Bible, uncompromisingly commanded major changes in church and society. The preface he composed for this purpose includes an astute analysis of what

Hooker presents as an implicitly revolutionary movement, as well as discussion of the comparative authority of conscience and consensus.

Following his attempt to set out acceptable general norms in Book I, Hooker sought in Books II-IV to refute three principles he saw as underlying the numerous particular Puritan complaints. These principles were (1) that the Bible is the sole rule for everything to be done in this life; (2) that the Bible must of necessity contain full directions for church government; and (3) that the adequacy of a church's reformation could be measured by its distance from the practices of the Roman church. Against (1) Hooker defended (partly on biblical grounds) the competence of human reason. Against (2) he defended the competence of individual national churches to govern their own affairs. Against (3) he developed a historically contextualized account of the scandalous and the edifying in religion.

3 The public duties of religion

The fifth and longest book of the *Laws* is primarily a defence of particular features of the Elizabethan Book of Common Prayer, which was thought by Puritans to be insufficiently Protestant. Hooker begins the book's two main sections, however, with general discussions of the contributions of religion to social well-being. Even in its details, Hooker's championing of public worship as the central setting for personal participation in the life of God is of philosophical interest. It challenges the widespread modern assumption that faith is purely an inward matter or, at its most external, one component of individual ethics - in any case something private rather than public. (Hooker's account of the 'virtue' and 'discipline' of repentance in Book VI also negotiates the border between the subjective and outward sides of religion and does so with a sensitivity unusual in a defender of law and order.)

4 Supreme authority in religion

In the three last books of the *Laws* Hooker turned to the weightiest political problem of his day, the location of supreme human authority in religion. Three positions concerned him: the Presbyterianism advocated by some Puritans as divinely ordained; the papal supremacy advocated as divinely ordained by, among others, Jesuits clandestinely active in England after 1570; and the supremacy of the English crown asserted in parliamentary acts under Henry VIII and Elizabeth I.

Some of Hooker's case against Presbyterianism can be gathered from earlier books, from the preface, and from his defence of episcopal authority in Book VII, but his chief objection both to Presbyterianism and to papal jurisdiction independent of national authority is put most cogently in the first chapter of Book VIII: both positions assume an untenable dualism of 'church' and 'commonwealth' even when the membership of both is identical.

With reliance on Aristotle (§§27-8), Hooker argued that the aims of political association included psychological goods (goods of the soul) and that, since the most important of these was religion, every body politic properly 'cared' for religion. Given the assumption, uncontested in his circumstances, that Christianity is the true religion, Hooker concluded that a commonwealth of Christians is a church, a body politic distinguished from other bodies politic, not by religion but by truth of religion: 'We say that the care of religion being common unto all *Societies* politic, such *Societies* as do embrace the true religion, have the name of the *Church* given unto every of them for distinction from the rest' ([1593-1662] 1989: VIII 1.2).

On this analysis, a royal supremacy of some kind was one way for a (national) community of Christians to care for its Christianity. Hooker's emphasis on the theoretically optional, communally chosen character of the royal supremacy is noteworthy. It may indeed explain why Book VIII was not published during the heyday of divine right monarchy under the early Stuarts. Besides grounding the crown's authority in communal consent, Hooker was also more insistent than any contemporary English author in construing that authority as legally limited. And further, as his recently discovered notes for Book VIII reveal, he intended to conclude the book with a substantial discussion of whether and how a community might correct an errant supreme ruler.

Although Hooker defended a supremacy in religious affairs granted to the civil ruler of the land, the limitations he placed on the royal supremacy, at a time when absolutism was budding in both theory and practice, suggest that Locke's use of Hooker to support the authority of community and law over regal power has more to be said for it than is often supposed. However, while Hooker could still envisage an agreed integration of spiritual and civil life as a feasible social goal, Locke saw the achievement of such coherence as a problem for individuals, who were

likely to solve it in fundamentally different ways.

Hope

In Christian theology 'hope' has a central role as one of the three theological virtues. As theology has gradually become separated from moral theory, the inclusion of 'hope' within a theory of ethics has become rare. Hope can be either intentional or dispositional. The former is a specific hope for something, whereas the latter is a state of character. Kant gave a central place to intentional hopes in his moral theory with his doctrine of the postulates. Hope also played an essential role in the moral and political writings of Ernst Bloch and Gabriel Marcel. Bloch regarded hope as concerned with a longing for utopia, whereas Marcel regarded hope as a disposition to rise above situations which tempt one to despair. In each of these writers the Christian connection between hope, on the one hand, and faith and love, on the other, remained, although Kant and Bloch did not oppose these categories to reason, but sought to 'subsume' them under it.

1 Historical outline

Hope first plays a significant role within Augustine's theory of morality where it appears as one of the three theological virtues - faith, hope and charity, or love (see Augustine §8; Theological virtues). According to Augustine, the virtue of hope is subordinate only to faith, and on a level footing with love: 'there is no love without hope, no hope without love, and neither love nor hope without faith' (*Enchiridion*).

As morality became separated from theology during the Enlightenment hope became less important in ethics. There are, however, three notable exceptions to this general trend: Immanuel Kant, Ernst Bloch, and Gabriel Marcel (see §§3-5). In each of these writers the connection between hope, on the one hand, and morality, religion and faith, on the other, is as tight as it was for Augustine. However, both Kant and Bloch interpret religion and faith neither as revealed nor as metaphysically proven, yet as reasoned, while Marcel contrasts both hope and faith to human desiring and calculating, that is, to instrumental rationality.

2 The concept of hope

Hope can be either intentional or dispositional (see Intentionality). Intentional hope is oriented to some desired state of affairs which is believed to be attainable. Hobbes describes such hope as an '*appetite* with an opinion of attaining' (1651: 123; original emphasis). Dispositional hope is a state of being hopeful. This state should be distinguished from optimism and wishful thinking.

A philosophical formulation of optimism is given in Leibniz's work (1710). For Leibniz, the thought that God could have created anything less than the best of all possible worlds is self-contradictory, since it would mean that God would not be the most perfect being, and hence would not be God (see Leibniz, G.W. §§3, 7). Consequently, we can be certain that present suffering is for the greater good and that the future will be as good as it can be (see Evil, problem of §2). This confidence that everything is for the best was famously, and justifiably, ridiculed in Voltaire's *Candide* (1759). But, unlike optimism, being hopeful is not based on the certainty that things will get better. Hope, unlike optimism, presupposes a degree of uncertainty. Descartes noted this when he pointed out that '[w]hen hope is extreme, it changes its nature and is called "confidence" or "assurance"' (1649: 351) (see also Spinoza 1677: 106-7).

Hope should also be distinguished from wishful thinking. It is as impossible to hope legitimately for something which is impossible as it is inappropriate to hope for something which is certain. All wishful thinking is by its nature illusory, whereas only illegitimate hopes are illusory.

3 Hope in Kant's moral philosophy

Like Augustine, Kant held that hope and love presuppose faith. Kant, however, viewed faith as moral faith. Moral faith, unlike what he called ecclesiastical faith, is not based upon belief in metaphysical truth or contingent historical fact, and so available only to those who know of this truth or fact, but is a reasoned corollary of the moral law, and available to all (1793: 93-4). For Kant, the ultimate hope is no longer a hope for union with God, but a hope to attain the highest good (*summum bonum*) which is demanded by the moral law. The three postulates of pure practical reason, as laid out in the *Critik der practischen Vernunft (Critique of Practical Reason)* (1788), namely the hope for the existence of God, for immortality and for the attainment of perfect freedom, are all

subordinate to this superordinate hope, and ultimately to the moral law.

Kant describes the assumption of the validity of the three postulates as ‘a need of reason’ (1788: 149). The use of the term ‘need of reason’ is not meant to suggest that the hope for the existence of God, immortality and freedom are necessary illusions. These postulates are both possible from a theoretical point of view, and objectively justified from a practical point of view by the fact that they are necessary corollaries of the moral law, which itself is based on reason (1788: 127). Since the postulates are the necessary and unavoidable conditions of the possibility of the *summum bonum*, every rational being ought (morally) to hope for the existence of God, immortality and freedom (1788: 149).

This moral argument for the belief (or hope) in God and immortality, has been subjected to a great deal of criticism. Nevertheless it has had an important influence on certain figures in twentieth-century critical theory. Walter Benjamin held that the historical materialist cannot abandon hope for those who have suffered past injustice, and therefore, cannot regard the past as closed. To do so would be implicitly to side with the victors and betray their victims (see §5 for an account of hope as a relation of communion or love).

Peukert also takes up this Kantian/Benjaminian approach to hope in *Science, Action and Fundamental Theology* (1984). Here he argues that utopianism requires hope (see Utopianism). Utopian existence would be destroyed if the individuals who participate in it were burdened with the memory of unredeemed suffering. He asks: ‘How can one hold on to the memory of the conclusive, irretrievable losses of the victims of history - to whom one owes one’s entire happiness - and still be happy?’ (1984: 209). If Peukert’s argument is sound, the very idea of utopia is incoherent without hope for immortality, for the redemption of the victims of history, and the hope that God exists.

4 Hope in Bloch’s thought

Ernst Bloch takes a Hegelian approach to religion. He conceives God not as radically opposed to the human subject, as the absolutely Other, in the way Kierkegaard does (1844: 44-5), but as a human ideal. Bloch interprets faith in God as a hypostatized longing for a utopian form of existence. Once this hypostatization is recognized for what it is, the concept of ‘God becomes the kingdom of God, and the kingdom of God no longer contains a god’ (1954-9: 1196). God is recognized as embodying the hope for an ideal but thoroughly human kingdom.

Bloch’s anthropological interpretation of religion owes a great deal to Feuerbach. He was, however, deeply critical of Feuerbach for eliminating all traces of the transcendent from religion. The human perfection which Feuerbach saw man as projecting onto God is not reappropriated in the recognition of this projection, but is recognized as the promise of reappropriation - that is, as the promise of human perfection. This promise of perfection is the transcendent element which remains in religion, even after its anthropologization (1954-9: 1284-8).

Bloch’s main critics included orthodox Marxists such as Manfred Buhr (1970), who were deeply suspicious of religious utopias. They see religion as tranquillizing, and socially stabilizing, as the ‘opium of the people’. Bloch acknowledged this conservative tendency within religion, but also interpreted the revolutionary tendency of religious hope as the most extreme manifestation of dissatisfaction with, and rebellion against, the present. For Bloch, religious utopias, especially the Christian utopia of the kingdom of God, express revolutionary hope for an utterly different and better form of existence (1954-9: 1193). They are not merely tranquillizing, but in principle transforming.

5 Marcel on hope

For Marcel, hope is a way of overcoming the trials of life. These trials can take the form of, for example, illness, separation, exile or slavery. ‘Hope is situated within the framework of the trial, not only corresponding to it, but constituting our being’s veritable *response*’ (1945: 30; original emphasis). Such trials are a potential cause of despair in which subjects ‘go to pieces’ or lose themselves (1945: 37). So there is no hope without the temptation to despair, and hope is understood by Marcel as ‘the act by which this temptation is actively or victoriously overcome’ (1945: 36).

Marcel is concerned not with intentional hopes, but ultimately with a particular form of dispositional hope which he expresses as ‘I hope in thee for us’ (1945: 60). To place one’s hope in somebody is not the same as to hope for something, that is, for some desired object, although it is usually related to such a hope. I do not want the person in

whom I have placed my hope (although I may hope to gain some desired object by placing my hope in another person).

Hope is here understood as trust without self-interest. It is not like the hope of patients who place their hope in the psychiatrist, which can be expressed as ‘I hope in thee *for me*’. Such hope is still bound up with self-interest. Marcel sees the fundamental form of hope as expressing human dignity as the ability to transcend one’s own desires and to hope for a shared project. Here hope transcends self-interest: my relation to the other person (or persons) in whom I have placed my hope is not instrumental, but a collaborative, ethical relation of communion (1945: 67). Marcel locates such hope against a background of faith in God (1945: 60-1), rather than seeing it as Kant did against the background of the moral law.

Although the ‘thou’ in whom I hope is, for the most part, another person or group, Marcel maintains that we can regard reality itself as a thou. We do this when we cease to regard it as something which can be described exhaustively in terms of a catalogue of facts, and of what can be inferred from these facts, and regard it as an open process, that is, as full of real possibilities which are unconstrained by what is or has been the case. Marcel distinguishes between an objective judgment based on the facts, such as the judgment that there is a chance that I will see my son again, and the simple affirmation, ‘You are coming back’, which is expressed in hope (1945: 66). The former is constrained by the evidence and by what can legitimately be inferred from this, whereas the latter is not so constrained. Such hope is not based upon a calculation, or miscalculation, of probabilities, and hence is not governed by the norms of such calculation. It is rather a refusal to calculate, a refusal to regard the future as wholly delimited by the past and the present. Thus, when hope takes this form, it is beyond objective criticism. It is, however, only beyond objective criticism in so far as it is an expression of love, rather than desire (1945: 66).

Horkheimer, Max (1895-1973)

One of the initiators and founders of the Institute for Social Research in Frankfurt, Germany, Max Horkheimer's philosophical importance derives from his programmatic essays of the 1930s in which he conceptualized the Institute's project of interdisciplinary research, and his later collaboration with Theodor W. Adorno in writing Dialectic of Enlightenment (1947). Horkheimer's vision of a 'critical theory' of society was intended as a reformulation of Marxist theory in which empirical research would be combined with philosophical reflection.

Born near Stuttgart, Max Horkheimer was the only son of a wealthy Jewish family. He studied philosophy at the then new Frankfurt University, writing both his doctoral thesis and *Habilitationsschrift* on Kant's *Critique of Judgment*. He became the director of the newly founded Institute for Social Research in Frankfurt in 1930, and organized the Institute's move first to Geneva and then New York City in 1934. Throughout the 1930s he edited the Institute's innovative journal *Zeitschrift für Sozialforschung (Journal for social research)*, in which appeared important and characteristic essays by Theodor Adorno, Herbert Marcuse and Walter Benjamin. Horkheimer re-established the Institute in Frankfurt after the war, and served as rector of the Frankfurt University from 1951 to 1953. After retiring, he moved to Italy.

Beneath the surface, and in all periods of his work, Horkheimer's philosophy was shaped by the attempt to align Karl Marx's materialist critique of bourgeois society with Arthur Schopenauer's pessimistic vision of human suffering in the midst of a meaningless universe (see Marx, K.; Schopenhauer, A.). Human suffering, the experience of which is the ground of creaturely solidarity, cannot for Horkheimer be transfigured or redeemed; even a future utopian society would carry the curse of the countless victims of history. While compassion for the suffering of other living beings and individuals' longing for happiness form the ethical core of Horkheimer's thought, his most distinctive contribution to philosophy emerges in his attempt to formulate a new Marxist theory of society which would overcome what he saw as the dogmatism and failures of the original.

In his essay 'Traditional and Critical Theory' (1937) Horkheimer attempts to elaborate how the interdisciplinary research programme of the Institute is to be separated from the then standard paradigm of scientific knowledge as a theoretical representation of a wholly independent object domain. What traditional theory overlooks is that both the activity of knowing itself and its (social) objects are historically formed. Because the categories of human existence are historically formed, philosophy needs to be supplemented by social scientific research. Because those same social categories are the bearers of human significance, they require philosophical elucidation. Hence, only a complex interdisciplinary programme integrating philosophy and the social sciences (sociology, history, economics, social psychology and psychoanalysis) can do justice to the complex problems facing contemporary society. While both the actual programme of interdisciplinary research and the hopes for it had faded for Horkheimer by the end of the 1930s, the project was re-launched by Jürgen Habermas, the leading second-generation exponent of critical theory.

For Horkheimer, what makes critical theory 'critical' is its combining of the Marxist 'critique of political economy' with the Kantian 'critique of pure reason'. The importance of the latter for Horkheimer should not be underestimated. In criticizing traditional theory, Horkheimer is assuming the Kantian, 'critical' distinction between the causal understanding of theoretical reason (*Verstand*) and the ends-oriented, holistic thinking of practical reason (*Vernunft*) (see Kant, I. §6). In Horkheimer's lexicon the former appears as 'subjective' or 'instrumental' reason, the latter as 'objective' reason. While in his original programme for critical theory Horkheimer intended the whole complex interdisciplinary practice to be a surrogate for objective reason, with the waning of any hope for radical social change his philosophy became a relentless critique of instrumental reason.

Written with Adorno, *Dialectic of Enlightenment* (1947) was intended to provide a theoretical and historical generalization of the critique of enlightenment found in Hegel's *Phenomenology of Spirit* (see Hegel, G.W.F. §5). The core claim of the *Dialectic* is that myth is already a form of enlightened, instrumental reason - an attempt to control hostile nature - and that the enlightenment critique of myth and superstition reverts to myth. By this latter claim Adorno and Horkheimer mean that the wholly disenchanted modern world is itself under a mythic curse or spell, in which individuals become anonymous ciphers within a wholly functional system. Instrumental rationality pervades the world - as the rationality of capitalist economy right through to the 'culture industry', and as the

reason of a positivistically understood science. Because instrumental rationality is only a part of reason pretending to be the whole of reason, it becomes irrational. It is this thought that lies behind the exorbitant claim that the whole (of society) is untrue (see Adorno, T.W. §3)

In *Eclipse of Reason* (1947), originally presented as lectures at Columbia University in 1944, Horkheimer presented a reprise of the central arguments of *Dialectic of Enlightenment* in a slightly simpler form. Only now is the insistent negativity of his collaborative work softened; throughout history, he claims, myth, religion and philosophy have presented versions of objective reason that have only slowly and recently been 'eclipsed' by subjective reason. While independent thought cannot renew the worn-out ideals of objective reason, it can find equivalents in the affinity of nature and human nature. Alas, these equivalents, given through art, cannot provide the pivot Horkheimer requires for a renewal of reason. At the end Horkheimer was left with only compassion and pity for suffering life, and the longing for sensuous happiness, that had been throughout the mainsprings of his thought.

Huainanzi (179-122 BC)

Huainanzi is both the honorific name of Liu An, the second king of Huainan and the title of the philosophical work for which he was responsible. The most important surviving text of the academy he established at his court, it consists of twenty-one essays that form a compendium of knowledge the Daoist ruler needs to govern effectively. In this work, the universe is a well-ordered, dynamic and interrelated whole, interfused by the unifying principle of the dao, *that develops according to patterns and processes comprehensible to self-realized human beings. The ruler must cultivate himself fully so that he comprehends these patterns and processes and must establish human society in harmony with them. Embracing the best ideas of earlier philosophers within a Daoist framework, the Huainanzi represents the fullest flowering of the Huang-Lao thought that dominated the early Han dynasty.*

Huainanzi is the honorific name sometimes given to Liu An, a Chinese philosopher-king who was the grandson of Liu Bang, founder of the Han dynasty (206 BC-AD 220). After his father, Liu Chang, was punished for *lèse majesté* and died on the way to exile, Liu An was enfeoffed as the second king of Huainan, a vassal state in what was then considered the southern part of China, today mostly in Anhui province. This area, previously part of the old state of Chu, had long been associated with hermit-mystics and shamans and still retained in the early Han a culture distinct from that of the north, where the new central government resided. By about 150 BC, Liu had established an academy at his court wherein Daoist and Confucian thinkers mingled with scholars of the esoteric arts (*fangshi*), proponents of the 'naturalist' cosmology of *yin* and *yang* and the five phases of *qi*, systematized a century earlier by Zou Yan (see Yin-yang; Qi). Among the many literary products of Liu's academy, the principal survivor is a text called the *Huainanzi*, which Liu presented to his nephew, Emperor Wu, in 139 BC. In 122 BC Liu was accused of sedition and he perished, along with many of his courtiers and his rival cultural centre, at the hands of imperial troops sent to quell his alleged rebellion.

The *Huainanzi* is a work of twenty-one essays on a wide range of topics that was intended to be a compendium of all the knowledge a Daoist sovereign needed to govern effectively. Its topics include cosmology and cosmogony, astronomy and astrology, seasonal ordinances, human nature, psychology and physiology, political theory and the theory of strategic warfare, and mystical self-transformation. Although a few scholars have maintained single authorship by Liu, the predominant opinion is that Liu edited, compiled and arranged the essays and wrote the final essay, which summarizes each of the others and rationalizes their arrangement in the text.

Although initially categorized by bibliographers as an eclectic work because of its selective use of the non-Daoist ideas of such earlier schools as the Confucians and Legalists, the *Huainanzi* is increasingly being recognized as a product of the Daoist syncretism of the early Han that many identify with the Huang-Lao lineage of thought. 'Huang' stands for Huangdi, the mythical Yellow Emperor, and 'Lao' stands for Laozi, the legendary author of the foundational Daoist text, the *Daodejing* (see Daodejing). In light of the mythical connotations of each figure and the ideas associated with this lineage, in the appellation 'Huang-Lao', Huangdi probably symbolizes the coordination of the political with the cosmological and Laozi probably symbolizes the mystical self-realization of the enlightened ruler. Taken together, we find the advocacy of a strong central government whose institutions, daily rituals, and organization of human society parallel greater patterns in the universe of which human beings form an integral part. This government is presided over by a benevolent ruler who is both philosopher and mystic and who is fully self-realized according to Daoist meditation techniques. During the first seven decades of the Han dynasty, the imperial court was dominated by Huang-Lao philosophy, a domination that was coming to an end when Liu An presented his *Huainanzi* to Emperor Wu. As a last-ditch attempt to convince the emperor to abandon the Confucian ideology he eventually chose, the *Huainanzi* represents the final flourishing of the Huang-Lao syncretism that adapted the best ideas of earlier thinkers into a Daoist philosophical framework.

In the cosmology of the *Huainanzi*, the universe is a well-ordered, intricately interrelated and constantly changing dynamic whole, governed by regular patterns and processes (*li*) that can be understood by exceptional human beings (see Li). Precise parallelisms exist between the basic levels of this universe. For example, the roundness of the human head parallels that of heaven, the squareness of the human feet parallels that of earth, heaven's four seasons parallel the four human limbs and so on. All phenomena are constituted of varying densities of *qi*, the vital energy/matter, and each has an inherent nature that determines its physical form and provides the spontaneous

tendencies for growth, development and response that arise during its lifetime (see Qi). Because each thing has a characteristic type of *qi*, one of its 'five phases', it resonates (*ganying*) with other things of the same phase and is thus impelled to develop or act in certain ways when acted upon by other things; when the seasons change, as the planetary bodies revolve and so on. All phenomena, processes and events within the universe on both macrocosmic and microcosmic levels are included in this grand 'correlative' scheme. While all act spontaneously, responses are never random and chaotic; they occur according to the regular and predictable patterns that govern the cosmos. Finally, the entire cosmos is interfused by a singular dynamic force called the *dao* (Way), which is inherent in each phenomenon as its ultimate unifying and guiding principle (see Dao).

Because human beings and their societies are integral parts of this dynamic, interrelated whole, they are subject to its same governing principles. Hence the ruler must know these principles and how the various levels parallel and interact with one another, and must set up governmental and societal institutions to accord with them. Furthermore, after establishing a hierarchical bureaucracy filled by officials whose deeds correspond to their titles, the ruler must cultivate a profound tranquility through meditation that enables him to become unified with the *dao*. Emerging from this mystical unity, the ruler has developed a totally unbiased clarity of mind that enables him to 'take no action (*wuwei*) and leave nothing undone'. With his mental acuity and metaphysical insight into cosmic patterns and inherent natures, the ruler can develop suitable tasks and appropriate customs for his subjects that enable them to realize the fullest potential of their inherent natures, transform his subjects through a mysterious resonance of *qi*, and more generally govern in a benevolent and unbiased manner that brings order and harmony throughout the land. This is how things were in the distant past of the sage-rulers, but the world lost this harmony because people lost the understanding of the value of - and the ability to effect - this profound coordination of the cosmological with the political. The *Huainanzi* was written to provide the ruler with the means to restore this harmony.

Huet, Pierre-Daniel (1630-1721)

Huet was a French Catholic bishop who wrote important works in theology, philology and literary criticism. In philosophy, he defended an apologetic interpretation of scepticism and opposed Cartesianism, which he thought to be a fanatical form of rationalism. For Huet, faith must guide reason since only the former, received from God, can provide absolute certainty, whereas human knowledge is inevitably fallible. A moderate scepticism is therefore the most appropriate attitude for a philosopher, since it tempers the ambitious claims of reason and extricates the mind from prejudices and false certainties, thus preparing it to receive the divine gift of faith.

1 Life

Pierre-Daniel Huet was considered one of the most learned men of his time. Born in Normandy, he was educated by the Jesuits and acquired a remarkable knowledge of Latin, Greek and mathematics while still very young. In Paris, he studied Hebrew and became deeply interested in the philosophy of Descartes. In 1652, he travelled with his friend Samuel Bochart to Holland and Sweden, where the latter had been invited by Queen Christina, and had the opportunity to meet Henricus Regius, Claude Saumaise and Isaac Vossius. After his return to Paris, he became acquainted with Gassendi, and in 1661 he founded a scientific academy in Caen which is still active. At the age of forty, Huet was elected tutor of the Dauphin Louis, son of Louis XIV, under Jacques Bossuet's direction. He began to edit the famous series of Classics *ad usum Delphini* and became member of the *Académie Française* in 1674. Ordained two years later, he was bishop of Avranches from 1689 when he published the *Censura philosophiae cartesianae*, a meticulous critique of Descartes' philosophy. In 1690, he published the *Alnetanae quaestiones de concordia rationis et fidei*, a theological treatise in which he argues that no truth or ultimate certainty can be reached without the help of faith. This was preparatory to the most famous of Huet's philosophical books, the *Traité philosophique de la faiblesse de l'esprit humain* (1723), which he seems to have considered his best work. Huet died in Paris, and his collection of more than 8,000 volumes, many bearing his annotations, later became part of the Bibliothèque Nationale. His anti-Cartesianism attracted much attention and, soon after his work was published, defences of Cartesianism were written against him by Andreas Petermann, Pierre-Sylvain Régis, Joannes Schotanus, Burchard de Volder and, in 1745, by Lodovico Antonio Muratori.

2 Anti-Cartesianism

Huet treats Cartesianism as merely another philosophical school attempting to restore the old mistakes of dogmatism. The importance Descartes ascribes to the sceptical approach is highly valuable, but his positive principles are all erroneous. First, the firmness of the 'Ego cogito, ergo sum' is deceptive for a number of reasons:

1 It is a mere tautology - either the 'ego' in the expression 'ego cogito' is meaningless, or it refers to something that already exists. But then the whole statement says nothing more than 'I exist and I am something that thinks; whatever exists and is something that thinks, exists; therefore I exist', and this is of course a true, but non-informative tautology.
2 It is not logically prior to, or more simple than, any other form of knowledge - it requires, at least, that one understands the principle 'whatever thinks, exists', and may be capable of using it as the premise of the relevant syllogism.
3 Its acceptance is inconsistent with the strategy of radical and systematic doubt - if Descartes can use the natural light to grasp the truth that whatever thinks exists, then why can the natural light not be employed to affirm other principles equally obvious, as that the whole is bigger than the part?
4 It is not immediate - the *Cogito* is a syllogism, and hence to be formulated requires a process of successive inferences, the correct application of logical principles and a reliable memory.

Second, the criterion of truth is established only via a vicious circle (see Descartes, R. §§5-7). We can trust that our clear and distinct ideas lead from the certainty of a belief to its truth if and only if there is a veridical God, but we can prove as true the existence of a veridical God only by relying on the certainty of our clear and distinct ideas.

Third, it is false that we know the mind before, and better than, the body, since the two are united, and Descartes' intellectualism (we are our minds, not our bodies) is wrong because mind and body are indivisible. The body, and

not the mind, perceives the physical objects, and the mind without the perceptual experience of the body would be empty, since we have no innate ideas, but only particular ideas made more general by abstraction.

Fourth, God's existence cannot be proved by reason. We possess only a finite and imperfect collection of ideas about God's nature, acquired via a negative procedure of amplification of what we know to be positive and exclusion of what we know to be negative in the world. We cannot rise from this inadequate description, whose origin is thoroughly dependent on our minds, to the necessary existence of its reference, with the certainty of a logical proof.

3 Scepticism

The Cartesian edifice therefore collapses and can be replaced by a moderate form of scepticism, to which Huet ascribes an apologetic function. The process of knowing consists of four stages: the Understanding receives perceptual impressions from physical objects, transforms them into image-like ideas, compares ideas and objects, and evaluates their correspondence. We know the truth when we know both the idea and that the idea perfectly corresponds to the object. Thus the level of certainty of our knowledge depends on the level of reliability of each of the previous stages, which Huet claims to be rather low, again for several reasons:

1 Since there is a gap between a physical object, as the source of knowledge, and its idea, as a mental product, knowledge of things is only indirect. Yet (a) everything changes constantly, including the known object, the impressions, and the knowing Understanding; (b) the senses are unreliable; (c) the Understanding is fallible; and (d) the Understanding modifies the impressions coming from the senses (Huet himself anatomized some animals, concluding that the nerve-channels are such that they must modify the impressions when they run through them.) Therefore, it is impossible to verify that internal ideas really correspond to external objects, and any description of the physical world remains at most verisimilar, but is never utterly certain.
2 It is impossible to demonstrate, by mere reflection, that the Understanding is capable of certainties, without falling into a *petitio principii*; but we can analyse the Understanding only by relying on the Understanding itself, thus falling into a vicious circle.
3 Knowledge of something *per genus et differentiam* (for example, to know man as the rational animal) is impossible. We know the genus of *x* if and only if we know both its essence and how it is similar to *y*, where *y* belongs to a different species but the same genus (for example, man and horse are two species belonging to the same genus, animal). Therefore, in order to provide the definition of *x* it is necessary to begin by knowing the essence of both *x* and *y*, but for this purpose it is necessary to know the genus of both, thus falling into a vicious circle. The same applies to the use of the notion of difference: in order to establish that *x* is different from *y*, we must first know both *x* and *y*, but such knowledge is based on the possibility of applying the notion of difference in order to have a definition of both.
4 Nobody can be certain that everybody else has the same impressions, or the same ideas on the same things. Moreover, the very notion of evidence is relative. People in different states (ill, drunk, sleeping, hungry, worried and so forth) perceive the world in different and irreconcilable ways. Perhaps Descartes was right: we do not know whether God - whose omnipotence is interpreted as boundless - has wished to create us so imperfect as to err always. What seems clear is that there is total disagreement about the nature of knowledge and truth even among the Dogmatists.
5 In order to know *x* adequately, we must also know the causes of *x*, but this leads to an infinite regress, for everything depends on something else, and the Understanding is incapable of omniscience.
6 We have no objective and uncontroversial criterion of truth. Huet distinguishes three meanings of criterion: the *criterium duquel* (the knowing subject); the *criterium par lequel* (the senses and the Understanding); and the *criterium selon lequel* (the action of the Understanding, when it applies the *criteria par lequel* in the search of truth.) But we have seen that human nature is unreliable, the senses and the Understanding are not sources of certainty and, with respect to the *criterium selon lequel*, if the faculties are unreliable then so is their action. The problem is that in order to find a proper criterion of truth we must already possess one.
7 Reasonings are always uncertain, and even simple syllogisms beg the question. For example, from the two premises 'all men are rational animals' and 'Peter is a man' we infer that 'Peter is a rational animal', but the first premise depends on inductive reasoning - every man examined so far has been a rational animal. So the inference is hypothetically certain (given the premise the conclusion follows necessarily), but the knowledge so achieved is still questionable, for God could create a man who is not rational. Syllogisms remain the best weapons of the

dogmatists, but they become harmless if one rejects their premises.

From all these arguments, Huet concludes that all forms of *human certainty* - in descending order, the certainty provided by God's words, mathematical certainty, perceptual certainty, and finally moral certainty (the certainty we have about what we have not experienced personally) - are inevitably bound within the limits of our capacities, and relative to our subjective condition. The Understanding can formulate plausible beliefs, but it necessarily remains unknown whether they represent true knowledge. It is possible to achieve total certainty only when there is direct and complete access to the intrinsic nature of things, but this happens only to the blessed souls who, illuminated by God, know with divine certainty and reassurance what, in the best case, we can believe only with limited confidence. While awaiting the acquisition of such a spiritual state, a probabilistic form of scepticism remains the most desirable attitude for a human being. As the origin of all philosophy, scepticism teaches us how to avoid epistemic errors, makes us more critical and independent of intellectual authorities, helps us to accept from every past philosopher whatever looks more acceptable and probable (eclecticism) and, above all, prepares the mind for the divine gift of faith.

Huet is aware of the classic arguments against scepticism. To the philosophers (Plato, Proclus and Descartes) who defend the presence of innate knowledge in the Understanding, he replies that they forget that nothing is in the mind which was not previously in the senses (see Plato §13; Proclus). Universals are acquired from particular ideas: sometimes one particular idea is elected as a general prototype (one particular triangle stands for all triangles), sometimes a general idea is the result of a process of abstraction from a collection of particular ideas (as happens with the idea of movement), but in any case we have no innate knowledge and no ultimate certainties. It is often argued, on the ethical side, that scepticism makes life impossible, is irreligious - because it suggests that God is deceitful, since he makes us incapable of knowledge - and undermines the possibility of developing any sort of belief, including faith in God, thus advancing the moral corruption of man. Huet rejoins that scepticism inclines us to avoid fanaticism and to follow the customs and habits of our time, without fully committing ourselves to anything but a reasonable trust in Christian religion. God has created us limited and weak, but free to give or withhold our assent to opinions. It is only our fault if we give precipitous assent to superficial opinions, and hence err. Scepticism does not lead to atheism. On the contrary, the recognition of the limits of our Understanding helps us to acquire faith. Since knowledge of God is not discursive, acquired by the Understanding with a spontaneous act, but intuitive and given by God to the soul as a free and generous gift, it is not epistemic and hence remains unaffected by sceptical doubts. This explains why, according to Huet, Christian religion appreciates scepticism, although it must be noted that most of the passages he quotes - from Wisdom, Ecclesiastes, Paul, Augustine, Aquinas, and many others - were meant to undermine intellectual pride, not human confidence in ordinary knowledge. Scepticism can be criticized on the epistemological side because it undermines all sciences, the greatest human achievement; because it either begs the question - since it presupposes a criterion to distinguish what is certain from what is only probable, and what is true from what is false, so, after all, the sceptic knows something - or it is self-contradictory, for it denies all knowledge and discredits the validity of all possible reasonings, including its own; and finally, because it does not lead to a systematic philosophy. Huet retorts that faith, not science, is the greatest human achievement, and the sceptic is not to be blamed because he reveals the embarrassing weakness of the Understanding. The dogmatist is hopeless, for he seeks truth through science, whereas the sceptic is happy with his probable opinions, makes no mistakes and is open to the religious message. Indeed, many people have become dogmatists rather than sceptics only because they are lazy, wishing to enjoy their ignorance without searching further. Descartes is one of them. He is ambitious and - although he has taken most of his ideas from ancient philosophers - he has ostracized erudition, cultural tradition and historical knowledge, thus removing the only basis for the collaborative construction of a body of verisimilar opinions. Scepticism is not self-contradictory either, because it eliminates even its own certainties, and follows only the most likely appearances. The sceptic is like Samson, who destroys the temple of dogmatic presuppositions and himself. Finally, scepticism does not give rise to an ordinary sect, but to the 'philosophy of not philosophizing', as Lactantius called it, which can nevertheless become fairly systematic, as Sextus Empiricus showed.

LUCIANO FLORIDI

List of works

Huet, P.D. (1661) *De interpretatione libri duo: quorum prior est, de optimo genere interpretandi, alter, de claris interpretibus*, Paris: repr. The Hague, 1683.(Huet defends the compatibility of stylistic ornamentation with the need to communicate, but warning that rhetorical ornaments can be like weeds, which spread and suffocate the good crop, and that conceptual content should have priority over literary form. The second part analyses the works of various translators of the Bible and of classic authors.)

Huet, P.D. (1668) *Origenis in sacram scripturam commentaria*, Rouen.(Edition in 2 volumes of the fragments of Origen's *Commentary on St. Matthew*, discovered by Huet in Stockholm, see J. P. Migne, *Patrologiae cursus completus*, Series Graeca, tom. 17.)

Huet, P.D. (1669) *Traité de l'origine des romans*, Paris; repr. Stuttgart: Metzler, 1966 (first edition, 1670), and Geneve: Slatkine, 1970 (Paris edition, 1799).(One of the first studies of the origin of prose romances. Huet traces the history of romance, providing copious references to earlier romance writers and their works. He defends romance from charges of mere entertainment and immoral temptation. The *Traité* was initially prefixed to the first edition of *Zaïde, histoire espagnole*, of Madame de La Fayette, as a *Lettre de Monsieur Huet a Monsieur de Segrais de l'origins des romans*. The work became a best-seller, was re-edited may times, and translated into several languages, including English, as *A treatise of romances*, London: 1672; *The history of romances*, London: 1715; and *An extract of Monsieur Huet's discours concerning the original of romances*, London: 1729. There have been several modern editions, including *The History of Romances, an annotated text edited, with introduction*, by Robert Clark Malcolm, University of Michigan, Ph.D. Thesis: 1983.)

Huet, P.D. (1679) *Demonstratio evangelica*, Paris; 2nd edn, 1680.(An attempt to prove the principles of Christian religion by means of an axiomatic apparatus. 'Praefatio' section 3, and 'Axiomata' IV sections 2 and 3 contain an interesting, sceptical philosophy of mathematics. The revised 1680 edition is more important.)

Huet, P.D. (1689) *Censura philosophiae cartesianae*, Paris; repr. Hildesheim, New York: G. Olms, 1971.(The sceptical reply to Descartes' *Meditations*. The first edition was printed by Kampen in 1690, but the work was printed and re-edited several times. The fourth revised and augmented edition of 1694 is the most important.)

Huet, P.D. (1691) *Traité de la situation du Paradis terrestre*, Paris.(Paradise is placed at the intersection of the Tigris and the Euphrates. The work was translated in several languages and edited many times. For an English translation by T. Gale see *A treatise of the situation of Paradise*, London: 1694.)

Huet, P.D. (1690) *Alnetanae quaestiones de concordia rationis et fidei*, Paris; repr. Leipzig, 1692.(This work, which takes its name from Alnay, Huet's abbey, is a bridge from Huet's anti-Cartesianism as a form of dogmatic and impious rationalism, to his moderate scepticism, in which the process of systematic doubt becomes preparatory to the acquisition of faith.)

Huet, P.D. (1692) *Nouveaux mémoires, pour servir à l'histoire du cartésianisme*, Paris; important 3rd edn, Paris: R. Mazieres, 1711.(Published under the name of Gilles de l'Aunay, this is a satire in which Huet presents a caricature of Descartes and derides, rather wittily but superficially, his philosophical positions.)

Huet, P.D. (1718) *Commentarius de rebus ad eum pertinentibus*, Amsterdam; trans. as *Memoirs of the life of Peter Daniel Huet, bishop of Avranches, written by himself*, London: Longman, Hurst, Rees, & Orme, and Cadell & Davies, 2 vols, 1810.(Huet's autobiography.)

Huet, P.D. (1723) *Traité philosophique de la faiblesse de l'esprit humain*, Amsterdam; repr. Hildesheim, New York: G. Olms, 1974; trans. as *An essay concerning the weakness of the Human Understanding*, London, 1725; and as *A philosophical treatise concerning human understanding*, London, 1729.(Written in 1690 but published posthumously, this combines ancient, sceptical arguments with the anti-intellectualist perspective of the Pauline tradition and the Neoplatonist distrust of empirical knowledge, to attack Cartesianism as the latest form of dogmatism.)

sciences, arts et belles-lettres de Caen, Nouvelle série, vol. 11.(Probably the most complete intellectual biography written so far, includes a wealth of interesting details on Huet's studies, his cultural milieu and his scientific activities.)

Volder, B. de (1695) *Exercitationes academicae, quibus Ren. Cartesii philosophia defenditur adversus Petri Danielis Huetii […] Censuram philosophiae Cartesianae*. Amsterdam.(A defence of Descartes against Huet's sceptical arguments.)

Hugh of St Victor (d. 1141)

Hugh of St Victor initiated the teaching programme that distinguished the Parisian abbey of St Victor during the twelfth century. His teaching combined an ambitious programme of biblical exegesis with the construction of theological syntheses and the detailed subordination of a comprehensive philosophy to both. Hugh's principal works in theology are biblical commentaries of different kinds and a theological overview based on the notion of sacrament. His philosophical works include Epitome Dindimi in philosophiam (Dindimus' Epitome of Philosophy) and, most importantly, the Didascalicon de studio legendi (Didascalion, or On the Study of Reading). This last book attempts to show how all human knowledge can be used as preparation for the study of the Christian Bible, which in turns leads to the contemplation of God.

Hugh of St Victor initiated the project of teaching and writing that came to distinguish the abbey of St Victor in Paris during the twelfth century. He is, in that sense, the first 'Victorine' theologian. His teaching combined an ambitious program of biblical exegesis with the construction of theological syntheses and the detailed subordination of philosophy to both.

The abbey of St Victor grew out of the community founded by William of Champeaux on his retreat from the Parisian schools of theology in 1108. William brought to the community customs of learning, but no distinctive theological or philosophical project. On his consecration as bishop in 1113, William secured for the small group a significant endowment and a royal charter permitting the free election of an abbot.

When Hugh entered the abbey sometime between 1115 and 1118, it had already begun a thorough reform of monastic life under its first real leader, Gilduin. It was thus ready to receive the kind of intellectual definition Hugh's work and his legacy would bring. Indeed, Hugh was a pioneer in each of the several fields that would become distinctive of the abbey, even as he brought it considerable renown as a school. Hugh himself served as the abbey's prior from 1133, and he died in 1141 within the community.

Hugh's study and teaching ranged widely. Indeed, he could be admired by someone such as Bonaventure just for the breadth of his education. One important group of his writings consists of scriptural interpretations. Hugh wrote three works in which he unfolded the image of Noah's ark into a paradigm of the stages of contemplation. Since the image of the ark is treated in enormous detail as a visual image, Hugh's tropological reading may also have had some influence on the aesthetics of Gothic art. However, Hugh also practised a kind of literal interpretation that put a premium on historical accuracy and made ample use of contemporary Jewish exegesis. One instance of his literal interpretation is a *Chronica (Chronicle)* in which he outlines the rational order of Hebrew history. This style of reading would be carried forward by Hugh's student, Andrew of St Victor. Hugh further undertook the construction of a unified or 'systematic' theology in his *De sacramentis christianae fidei (On the Sacraments of the Christian Faith)*. This impulse to theological construction was continued by another of Hugh's followers, Richard of St Victor, who knew of Hugh only through his writings. Hugh also produced a number of spiritual writings in more traditional genres, as well as sermons and letters.

Hugh produced several works that can be counted philosophical. There are, for example, introductory treatises on the liberal arts. One of these, *Epitome Dindimi in philosophiam (Dindimus' Epitome of Philosophy)*, is a short dialogue that lays out definitions and divisions of philosophy for the beginner. It can serve to show how broadly Hugh understands philosophy. He divides philosophy into four parts: logic, ethics, theory and mechanics. Logic comprises grammar and the rule of inference (*ratio disserendi*), which is in turn divided into probable, necessary and sophistical reasoning. Ethics comprises the solitary or individual, the domestic or economic and the public or political. Theory covers mathematics, physics and theology, which here means not Christian doctrine but the study of immaterial beings. In last place, Hugh incorporates what he calls 'mechanics'. Here he means not only technologies such as weaving or techniques such as navigation, but medicine and even theatre. Hugh seems the first Latin author to make 'mechanics' a part of philosophy (see Natural philosophy, medieval).

The disposition of the parts of philosophy and their subordination to Christian ends is accomplished more fully in Hugh's *Didascalicon de studio legendi (Didascalion, or On the Study of Reading)*, which must be regarded as his masterpiece in philosophy. In accord with current taste, Hugh borrows for his title the Greek term *didascalicon*,

which he probably takes to mean the art of teaching. His *Didascalicon* is, indeed, a work that teaches what, when, and how to read for the sake of a well-formed wisdom. The *Didascalicon* is divided into two parts, each of which has three Books. The first part concerns philosophy and all its parts, which are distinguished much as they were in the *Epitome*. The second part, which finds no correspondence in the *Epitome*, concerns the reading of 'holy writings', which are principally but not exclusively found in the Christian Bible.

The treatment of philosophy in the *Didascalicon* is considerably more detailed than in the *Epitome*. Here Hugh provides not just descriptions of each part of philosophy, but remarks on their founders or principal authors and on the sequence of study. Throughout, he follows traditional sources. He seems mostly uninfluenced by the pieces of Arabic science that were beginning to find their way into Latin learning (see Translators). More importantly, Hugh here reiterates an Augustinian account of how the various moments in the study of philosophy adumbrate a unified wisdom in which 'the form of the complete good' is grasped (see Augustinianism). This wisdom is, of course, Christian. The study of 'holy writings' both completes and corrects the study of philosophy. Hugh introduces the second part of the *Didascalicon* by comparing the writings of philosophers to a whitewashed wall that covers over the clay of error with seeming truth. The Christian Bible, by contrast, is like a honeycomb: dry on the outside, filled with sweetness within.

The second part of the *Didascalicon* is in this way something more than an introduction to biblical study. It does contain a number of chapters on the levels of scriptural meaning, as on the canon and the rules for resolving ambiguous interpretations. However, it directs these materials to a practice of meditation in which scriptural reading is enacted as communion with God. This communion is the Christian's philosophy. Indeed, the person whom Hugh calls the 'Christian philosopher' turns out to be a monk reading Scripture prayerfully. 'The monk's simplicity is his philosophy', and the monk's 'philosophizing' is not academic disputation, but delight in learning from Scripture the life of virtue.

Human nature

Every political philosophy takes for granted a view of human nature, and every view of human nature is controversial. Political philosophers have responded to this conundrum in a variety of ways. Some have defended particular views of human nature, while others have sought to develop political philosophies that are compatible with many different views of human nature, or, alternatively, which rest on as few controversial assumptions about human nature as possible. Some political philosophers have taken the view that human nature is an immutable given, others that it is shaped (in varying degrees) by culture and circumstance. Differences about the basic attitudes of human beings toward one another - whether selfish, altruistic or some combination - have also exercised political philosophers. Although none of these questions has been settled definitively, various advances have been made in thinking systematically about them.

Four prominent debates concern: (1) the differences between perfectionist *views, in which human nature is seen as malleable, and* constraining *views, in which it is not; (2) the* nature/nurture *controversy, which revolves around the degree to which human nature is a consequence of biology as opposed to social influence, and the implications of this question for political philosophy; (3) the opposition between* self-referential *and* other-referential *conceptions of human nature and motivation - whether we are more affected by our own condition considered in itself, or by comparisons between our own condition and that of others; and (4) attempts to detach philosophical thought about political association from all controversial assumptions about human nature.*

1 Perfectionist versus constraining views of human nature

The most celebrated proponent of perfectionist views of human nature is Aristotle, and his most elaborate discussion of the question appears in *The Nicomachean Ethics* (*c*.330 bc). Aristotle's view developed there is sometimes described as teleological because it was defined by reference to a fundamental contrast between untutored or brute human nature on the one hand, and human nature as it could be if we realized our essential nature or *telos* on the other. Ethics, for Aristotle, is the science that instructs us how to get from the one to the other. When correctly employed, ethical precepts thus have the potential to transform human beings from their rude and untutored states into the best kinds of beings they can become.

Although there is both room and need for human nature to develop and change on Aristotle's view, his is a *naturalist* one in that both the accounts of brute human nature and perfected human nature are rooted in a philosophical psychology, a theory of natural human needs and potentials. Naturalist views are generally distinguished from *anti-naturalist* accounts, in which the sources of meaning and value for human beings are externally given, whether in Platonic forms, transcendental arguments about the nature of knowledge and obligation, or some other extrinsic origin. On anti-naturalist views what is good or right is good or right regardless of actual human needs and desires, whereas for naturalists the gulf between 'is' and 'ought' is bridged via an account of human needs or psychology (see Naturalism in ethics; Needs and interests). Naturalist perfectionism can be secular or theologically-based; indeed, much medieval Christian Aristotelianism rested on the adaptation of the story of the Garden of Eden, the Fall from Grace, and the possibility of redemption to Aristotle's ethical categories. Marxism, on the other hand, is a secular version of naturalist perfectionism. For Marx, human beings as we find them are alienated from their 'true' selves, their potential stunted by a variety of malevolent forces. But these forces are in some sense artificial impediments to human flourishing that can be understood and ultimately vanquished, opening the way for authentic human development (Marx 1875) (see Alienation §6).

Although perfectionist views can be naturalist or anti-naturalist, constraining views of human nature are invariably naturalist in character. Proponents of constraining views regard human nature as an immutable given, holding that social and political institutions must take account of it but that have no effect on it. Perhaps the most extreme proponent of this view in the history of Western philosophy was Jeremy Bentham (§3), who made it an axiom of his utilitarian system that nature: 'has placed mankind under the governance of two sovereign masters, *pain* and *pleasure*' (1948: 125). For Bentham, pleasure seeking and pain avoidance 'govern us in all we do, in all we say, in all we think: every effort we can make to throw off our subjection, will serve but to demonstrate and confirm it' (1948: 125). Bentham believed that the utilitarian system he advocated was uniquely scientific in that it recognized our inescapable subjection to the pleasure/pain calculus.

Although Bentham offers one of the most forthright and clear accounts of a constraining view of human nature, his is by no means the first or the only such view in the history of Western political theory. In their modern form such views are traceable at least to Hobbes' insistence, *contra* Aristotle, that human nature is rigidly fixed. For Hobbes human beings are inescapably driven by a primordial fear of death, which produces in them a 'relentless desire for power after power'. Basic human impulses can be channelled in more and less productive ways, and to some extent people can be educated to see that certain political allegiances are better than others given their basic impulses, but the impulses themselves cannot be altered (Hobbes 1651) (see Hobbes, T. § 6).

Utilitarians since Bentham have generally regarded human nature as given and external to the operations of political and cultural institutions. Even if utilitarians have differed greatly from one another concerning the content of human nature and even how much we can reasonably aspire to know about its content, they have generally accepted Hume's dictum that 'reason is the slave of the passions'. Whereas Hume, like Bentham, thought we are all driven by the same passions in the same ways, neoclassical utilitarians of the late nineteenth and early twentieth centuries (such as Pareto 1970) questioned this assumption, taking a view of human nature that was perhaps most decisively stated by the emotivist philosopher Charles Stevenson in his critique of Hume: that even if we are convinced that all human beings are driven by needs for gratification of some sort, there is no decisive reason to think we all have the same such needs, or even that we can intelligently compare different desires experienced by different individuals with one another (Stevenson 1944). This is the standard view in modern economics and rational choice theories of politics: Preferences are thought of as exogenously determined, but the possibility of meaningful interpersonal comparisons of preferences across individuals is denied (see Utilitarianism; Economics and ethics).

2 The nature/nurture controversy

Since time immemorial scientists and philosophers have debated the question whether human nature is biologically given or rather the result of contingencies of cultural and historical circumstance, and these debates have been thought to be pregnant with political significance. Rousseau (§2), for example, was the first in a long line of political theorists who have argued that Hobbes' political system was based on a confusion of parochial traits that were the product of seventeenth-century English life with enduring features of the human condition. In Rousseau's view, Hobbes wrongly thought the impulse toward self-preservation was incompatible with a desire to preserve others: 'because of [his] having improperly included in the savage man's care of self-preservation the need to satisfy a multitude of passions which are the product of society' (1964: 129). Rousseau's own account of the state of nature has been criticized on analogous grounds however. Indeed it has become a standard move in modern political argument to question every assertion about natural human traits and propensities, however qualified or historicized, by arguing that the traits in question are socially produced or 'socially constructed'. Such debates can become exceedingly heated when they become embroiled in discussions of the determinants of intelligence and such things as ethnic, racial and gender differences (see Sociobiology).

The nature/nurture controversy is often confused with the issue of whether or not human nature is alterable by human design. It is often said, for instance, that much or all of human nature is socially constructed rather than naturally given, and that for this reason it should not be regarded as immutable. In fact, whether a given human characteristic is a product of nature or culture may have little to do with the degree to which it is alterable by conscious human design. On the one hand, there are many features of the natural world that human beings have effectively altered and will alter more in the future; the science of genetic engineering, for example, is presumably in its infancy. On the other hand, there are many pieces of human reality that, while indisputably the product of human action, we often seem powerless to influence. Ethnic hatred may be learned, for example, yet it may be impossible to get people to unlearn it or even to stop them passing it on to the next generation.

It is sometimes thought that cultural creations can be more easily understood than natural creations because they are the products of the human will. This view was common in the seventeenth century, for example, where philosophers like Hobbes and Locke, under the strong influence of the Cartesian idea that the reflective individual has privileged access to the contents of their own mind, held that only this individual can really know 'the ghost in the machine' in Gilbert Ryle's memorable phrase. Knowing one's own motivations and understanding one's behaviour guarantees nothing, however, about one's understanding of the complexities of human interaction in the social and political arena. In any case, in a post-Freudian age the Cartesian view must be regarded as questionable.

We might be confused, or wrong, or we might deceive ourselves about our motivations and purposes. For all we know Bentham might have been right when he insisted that, 'it is with the anatomy of the human mind as with the anatomy and physiology of the human body: the rare case is, not that of a man's being unconversant, but of his being conversant with it' (1954, vol. III: 425). In short, the human capacity to shape human nature is a product of how well we can understand and control the causal mechanisms that lead human traits to be what they are. This is contingently related, if it is related at all, to whether a particular trait is a product of biology, culture, some combination of the two, or some third thing.

For all the attention it has received from political philosophers over the centuries, the nature/nurture controversy is a red herring in a second respect as far as politics is concerned. Since human beings are naturally conventional creatures who often achieve biological adaptation through social learning, the distinction between what is natural and what is cultural in human behaviour is not merely difficult to pin down in practice, but impossible to get at in principle. Perhaps partly for this reason, in recent years much of the discussion in Anglo-American political and moral philosophy has turned away from the nature/nurture debate and towards requiring principled justifications for any differences among persons that have political consequences, regardless of their origin. John Rawls is perhaps more responsible for this than any other single figure. In *A Theory of Justice* (1971) he makes the case that differences in talents and abilities among persons, whether natural or cultural in origin, are 'morally arbitrary'; that is, they are products of luck either in the genetic lottery or in the milieu into which one happens to be born. In either case, the differences are not chosen or produced by actions for which the relevant agents can reasonably be held responsible. By the same token, it seems unfair that benefits should accrue to persons differentially in virtue of differences in their talents and abilities, whether such differences are rooted in nature, culture or both.

Making the Rawlsian move has the effect of socializing human capacities regardless of their origins (at least as a normative matter), and although it is exceedingly difficult to find a principled basis on which to resist his reasoning, it generates problems that are in many ways as difficult as those that it resolves. A person might find it both rationally undeniable and psychologically impossible to accept that nothing they do or achieve is the autonomous result of their own efforts. Analogously, it might be argued that for both individual and species some fictions about individual responsibility for different outcomes may be required for human reproduction and wellbeing, even if we know them to be fictions. Such beliefs may be indispensable to the basic integrity of the human psyche and necessary for generating and sustaining the incentive to work on which human beings are, after all, critically reliant. As a result, although facts about moral luck and socially produced productive capacities conspire - when confronted - to enfeeble the idea of individual responsibility for outcomes, people may none the less be powerless to abandon it (see Responsibility). One interesting strand of modern scholarship by Ronald Dworkin, Amartya Sen, Richard Arneson and others attempts to grapple with the issues raised by Rawls' discussion of moral arbitrariness, but it has not converged on any single or compelling conclusion (see Dworkin, R.).

3 Self-referential versus other-referential conceptions of human nature

A third dimension along which conceptions of human nature vary concerns the degree to which people's interests are linked to the fortunes and perceptions of others. Contrast Ronald Reagan's 1984 election slogan: 'Are you better off now than you were four years ago?' with an employee who says to his employer 'I don't care what I get paid, so long as its more than Jones down the corridor'. The Reagan slogan is based on a *self-referential* conception of human nature; it assumes that people are interested in improving their own fortunes without any necessary reference to anyone else. The latter example is *other-referential*: a person's perception of their interests is intrinsically reliant on the welfare of others. We cannot make a judgment about their welfare without reference to the welfare of others. The distinction between self- and other-referential views operates independently of whether one is a subjectivist and of the basic metric of value along which welfare is judged. For instance, Marx's measure of exploitation is radically other-referential in that it is critically reliant on the proportion of the social surplus that the workers receive as compared with employers. Thus his technical measure of the rate of exploitation may increase even if real wages are increasing and the worker's subjective sense is that his welfare is improving. Rawls, on the other hand, works with a hybrid of self- and other-referential views of human nature in that he argues that rational people will always want to improve the lot of the worst-off individual in society, relative to what it was before, even if this means that who is the worst off changes.

Whether one thinks human nature is basically self- or other-referential has substantial implications for politics and distributive justice. Utilitarians, both classical and neoclassical, tend to think of people as self-referential maximizers who want to get on as high an indifference curve as possible without reference to anyone else, although there is no necessary reason that this be so. Aristotelians like Alasdair MacIntyre (1981), on the other hand, are necessarily committed to other-referential views. For them what people value above all is to be valued by others whom they value (see MacIntyre, A.; Recognition). 'She's a cellist's cellist' is an appellation we intuitively grasp, and to the extent that it captures something fundamental about what motivates people, models of individual maximization that ignore it will be descriptively misleading and morally unsatisfying. In this connection it is worth noting that in Hegel's (1807) *Phenomenology* the argument is made that slavery is an unstable set of social arrangements not merely because the slave can eventually be expected to resist oppression, but also because the master will find it unsatisfying; he needs recognition from someone whom he values (see Hegel, G.W.F.).

Whether and to what extent human nature is substantially self-referential is not to be confused with whether and to what degree people are selfish. Although self-referentially motivated people may typically be indifferent - at best - to the fortunes of others, other-referential motivations may be more or less selfish. The demand to be paid 'more than Jones', 'the same as Jones' or 'less than Jones' are all other-referential in character, although they vary considerably on the dimension between selfish and altruistic motivation. Sadists and rapists exhibit what economists refer to as 'interdependent negative utilities' in that their wellbeing is intrinsically linked to the suffering of others; so too does the divorcing spouse whose utility increases if a dollar is taken out of the pocket of their spouse and burned. These are all other-referential types of motivation, no more or less than are the motivations of those who seek and experience increased happiness at another's happiness or success. In short, the self-referential/other-referential dimension refers to the structure of human psychology rather than its content. This is not to say that the structure has no implications for content. In particular, to the extent that people are other-referentially motivated, their behaviour and aspirations will tend not to be captured by rational agent models adapted from microeconomics, which rest exclusively on self-referential assumptions about human psychology. People who find arguments based on rational agent models unsatisfying descriptively or morally tend to be sceptical of the extent to which self-referential assumptions capture important dimensions of the human condition. Whether or not such scepticism is warranted is in the end an empirical question; it will not be settled by armchair reflection (see Rational choice theory).

4 'Political' versus 'metaphysical' conceptions of human nature

Given the enduring - perhaps endemic - disagreements about human nature it is perhaps unsurprising that some political philosophers have sought to develop political theories assuming as little as possible about it. One strategy that has been extensively explored since the 1960s is to try to seek political principles that are neutral between different views of human nature and conceptions of the human good. Some of Rawls' earlier formulations of his project were understood thus, and Bruce Ackerman, Charles Larmore and others subsequently attempted to formulate different neutrality arguments (see Neutrality, political §§1, 4). By the 1990s a fairly broad consensus had begun to emerge that neutrality arguments fail, that there is no set of political principles that can be genuinely neutral among different conceptions of human nature and the human good, and that a little digging into allegedly neutral arguments will inevitably bring their assumptions to the surface.

A subtler response to the problem is to abandon the search for neutral political standards, but retain the ambition to develop political principles that may be compatible with as many different views of the human condition as possible. Here the key idea is to try to limit what one might reasonably expect of justification in political theory, and in particular to abandon all aspirations to get at the true or right theory of human nature. This is the strategy adopted by the later Rawls (1992), who asks: which political principles does it make most sense to agree on, given that we know we will never all agree on basic metaphysical questions about the human condition? The answer to which he is drawn is the one that tolerates as many conceptions of the human good as possible, consistent with a 'like liberty for all'. This approach explicitly abandons the agenda of coming up with right answers to questions about human nature, seeking only to tolerate as many answers as possible. It courts the possibility that it may actually lead us not to tolerate the 'true' view of human nature if, for instance, this is embedded only in a fundamentalist religion that also requires that no other views be tolerated. On a 'political not metaphysical' approach, we are not expected - as political theorists - to take any view on the question whether the fundamentalist view is correct; for all we know it might be. However, since we can never know that it is the correct view and we

do know that there will always be competing views, it is never rational to accept it as governing our politics. Various difficulties confront this and other attempts to move in the ‘political not metaphysical’ direction, and some will find the philosophical abdication implied by this strategy impossible to live with. But in a world in which assumptions about human nature are both indispensable to politics and endemically controversial, it is difficult to see how the impulse to turn to institutional, rather than philosophical, solutions to the problems it creates can reasonably be resisted.

Human nature, science of, in the 18th century

Eighteenth-century speculation on human nature is distinguishable by its approach and underlying assumptions. Taking their cue from Francis Bacon and Isaac Newton, many philosophers of the Enlightenment endeavoured to extend the methods of natural science to the moral sciences. Perhaps the most explicit of such endeavours was David Hume's ambition for a 'science of man', but he was not alone. There was a general convergence on the idea that human nature is constant and uniform in its operating principles - that is, its determining motives (passions), its source of knowledge (sense experience) and its mode of operation (association of ideas). By virtue of this constancy human nature was predictable, so that once it was scientifically understood, then social institutions could be designed to effect desired outcomes.

David Hume regarded his proposed 'science of man' as fundamental because upon it depended not only logic, morals, criticism and politics but also even mathematics, natural philosophy and natural religion. Hence he believed that if that science is conquered then a relatively easy victory over the others can be expected. We know from Hume's own *Abstract* (1740) of the *Treatise of Human Nature* (1739-40) that he himself thought the most original element was the use made of the principle of the association of ideas. Hume identified three principles of association - resemblance, contiguity and causation (see Hume, D. §2). Starting from the Lockean premise that any inquiry into human nature must rely entirely upon experience, these principles operate uniformly for humans to bind the universe together. Just as there is, accordingly, a general course of nature with respect to the sun and climate, so there is in human actions; and just as there has been great success in the understanding of natural phenomena, so Hume aimed to emulate that success in the moral sciences through adopting its 'experimental' procedures. While this was Baconian in provenance (see Bacon, F.), it was Newton's achievements that were more generally paradigmatic (see Newton, I.).

Newton himself had indicated the appropriateness of the endeavour when in Question 31 (1953: 179) of the *Opticks* (1730) he remarked that if the analytical method of natural philosophy is perfected then 'the bounds of moral philosophy will also be enlarged'. Since for Newton the key to natural philosophy lay in mathematics, one characteristic of the eighteenth-century attempt to establish a science of human nature was to subject the phenomena of human nature to quantification. Francis Hutcheson, whom Hume identified as one of his predecessors in the scientific quest, flirted with this when he developed a calculus derived from certain simple axioms whereby $M=B \times A$ or the moment of good equals benevolence times ability (see Hutcheson 1725).

Although Hutcheson excised this calculus from later editions of the *Inquiry*, this quantitative and calculative concern persisted. Jeremy Bentham stated that we are governed by the two sovereign principles of pleasure and pain, and that it is the principle of utility that recognizes this subjection and employs it as the foundation of a system. The object of this system is to promote felicity, and to achieve that end with precision it is necessary to calculate which policies will produce a net balance of pleasure over pain. Armed with this scientific knowledge, the legislator will be able to pass laws that can be guaranteed to further the interests of the community. The view that this science should be useful is typical. Cesare Beccaria, in his argument for a reformed penal system (see Beccaria 1764), held that punishment should be determined with geometric precision, and that the probability of guilt amounts to moral certainty - something humans necessarily presuppose in daily life. The computation of such probability was undertaken by the Marquis de Condorcet, by far the most sophisticated eighteenth-century social scientist.

Condorcet stands at the end of a significant French tradition, which, although there is a Cartesian ingredient, has a similar genealogy to that of the British. This is evident in Etienne Bonnot de Condillac, the most systematic French writer. He too believed that moral reasoning was susceptible to the same exactitude as geometry, and also identified the association of ideas as the key to the study of human nature. Condillac sought to trace all 'ideas' to sensation thus rendering Locke's 'ideas of reflection' derivative. In his *Traité des sensations (Treatise of Sensations)* of 1754 he traced the development of a statue, such that by the addition of each of the senses in turn it came to possess the full range of human mental ability.

Any account of human nature seemingly has to distinguish the nature of humans from that of animals. Georges, Comte de Buffon, who wrote the fullest scientific natural history (1749-89) in the eighteenth century, thought
